A group of toxicity tests on RTG-2 cell line (a fibroblastic line derived from rainbow trout) was standardized in order to enhance reproducibility and sensitivity. Liquid chromatographic (LC) separation of organic chemicals from industrial effluents and polluted waters and in vitro toxicity tests on RTG-2 as a biological detector of toxicity in the eluted peaks were conducted. Effluents and polluted waters were concentrated, if required, using Sep-Pak C-18 cartridges, and analyzed by reversed-phase LC using a 30-cm C-18 column with an acetonitrile gradient from 10 to 100% in water in 60 min at a flow-rate of 1 mL/min and UV detection at 254 and 280 nm. The cytotoxicity test was adapted to use 20-microliter fractions of acetonitrile-water mixtures, allowing toxicity detection every 12 s with eight replicates per sample (or every 5 s with four replicates). The LC-cytotoxicity test combination allowed the detection in the effluents of those compounds for which short-term aquatic toxicity could be expected. Cytotoxicity to fish cell lines was found to be fairly well correlated with in vivo toxicity tests on fish, showing the capability of this method. The correlation between in vivo and in vitro methods has also been demonstreaed in mammalian cells, and therefore this method is usefull not only in aquatic toxicology but also, by choosing a representative cell line, in environmental, clinical or forensic toxicology. AUTOMATED METHOD FOR THE DETERMINATION OF BORON IN WATER BY FLOW-INJECTION ANALYSIS WITH IN-LINE PRECONCENTRATION AND SPECTROPHOTOMETRIC DETECTION.
National Water Research Inst., Burlington (Ontario). Research and Applications Branch.
I. Sekerka, and J. F. Lechner.
Analytica Chimica Acta ACACAM, Vol. 234, No. 1, p 199-206, July 1990. 6 fig, 5 tab, 33 ref.

Descriptors: *Analytical methods, *Boron, *Chemical analysis, *Pollutant identification, *Spectrophotometry, *Water analysis, Emission spectrometry, Ion exchange, Monitoring, Natural waters.

A sensitive, automated method for the determination of boron in water samples is described, involving flow injection with on-line ion-exchange preconcentration and spectrophotometric detection of the azomethine-H-boron complex. The method is applicable to various water samples and is free from interferences, even in colored samples. Detection limits of 5 microgram/L at 20 samples/h and 1 microgram/L at 10 samples/h with relative standard deviations of < 10% at 1-10 microgram/L and < 5% at 10-200 microgram/L levels of boron were achieved. The recoveries for spiked natural water samples ranged from 96 to 101%. The method compares favorably with inductively coupled plasma atomic emission spectrometry. (Author's abstract)

LIQUID CHROMATOGRAPHIC METHOD WITH FLUORESCENCE DETECTION FOR THE DETERMINATION OF POLYCYCLIC AROMATIC HYDROCARBONS IN ENVIRONMENTAL SAMPLES.
Laboratorio Municipal de Barcelona (Spain). Seccion Quimica y Bromatologia.
M. D. Nunez, and F. Centrich.
Analytica Chimica Acta ACACAM, Vol. 234, No. 1, p 269-273, July 1990. 6 fig, 3 tab, 11 ref.

Descriptors: *Chemical analysis, *Fluorescence, *Hydrocarbons, *Liquid chromatography, *Pollutant identification, *Polycyclic aromatic hydrocarbons, *Water analysis, Analytical methods, Extraction techniques.

A method using liquid chromatography (LC) with fluorimetric detection for the determination of polynuclear aromatic hydrocarbons (PAHs) in water samples and air filters is presented. The study focused on fluoranthene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene and benzo(ghi)perylene. The behavior of these compounds was studied using two columns with the same stationary phase(C-18), but different supports, Hypersil-ODS and Spherisorb ODS-2. Better resolution was obtained with Spherisorb ODS-2. Samples were extracted with light petroleum-diethyl ether (85 + 15) and the extracts were concentrated before analysis. Reversed-phase liquid chromatography with fluorescence detection was applied to separate and determine the PAHs. Recoveries of individual PAHs from spiked water samples were 0.16-0.27 ng/mL. Detection limits in the picogram range were obtained for each compound based on recoveries of 79-96% from the water matrix. (Agostine-PTT)

SPECIATION OF MERCURY COMPOUNDS IN WASTE WATER BY MICROCOLUMN LIQUID CHROMATOGRAPHY USING A PRECONCENTRATION COLUMN WITH COLD-VAPOR ATOMIC ABSORPTION SPECTROMETRIC DETECTION.
Nagoya Univ. (Japan). Dept. of Applied Chemistry.
E. Munaf, H. Haraguchi, D. Ishii, T. Takeuchi, and M. Goto.
Analytica Chimica Acta ACACAM, Vol. 235, No. 2, p 399-404, August 15, 1990. 6 fig, 1 tab, 26 ref.

Descriptors: *Atomic absorption spectrophotometry, *Chemical analysis, *Heavy metals, *Liquid chromatography, *Mercury, *Pollutant identification, *Speciation, *Wastewater analysis, Analytical methods, Mercury compounds, Wastewater.

A microcolumn liquid chromatographic method with cold-vapor atomic absorption spectrometric detection was developed for the speciation of mercury compounds in wastewater. The sample solution containing mercury at the 4-ng level was injected into a preconcentration column (27 mm x 0.51 mm i.d.) packed with Develosil-ODS (30 micrometer) and eluted with cysteine-acetic acid through a separation column (125 mm x 0.5 mm i.d.) packed with STR-ods-H 95 micrometer). After oxidation, tin (II) chloride in sodium hydroxide solution was used to reduce mercury compounds to mercury. The generated mercury vapor was swept from a gas-liquid separator by argon into the detector cell and monitored at 253.7 nm. Mercury (II) chloride, methylmercury chloride and ethylmercury chloride, were well resolved and the determination was completed in less than 16 min. The method was successfully applied to the speciation of mercury compounds in wastewater. (Author's abstract)

Chemosphere CMSHAF, Vol. 19, No. 12, p 1921-1927, 1989. 2 fig, 16 ref.

Descriptors: *Analytical methods, *California, Chemical analysis, *Hazardous wastes, *Leachates, *Mass spectrometry, *Pollutant identification, *Water analysis, Chlorine, Halogens, Ion exchange chromatography, Organic pollutants, Phosphorus, Sulfur.

Liquid chromatography particle beam mass spectrometry (PB/MS) is a powerful tool for the analysis of target pollutants but complementary methods are required for nontarget compounds. Preliminary data are presented on an anion exchange chromatography PB/MS based method for the detection of the target compound 4-chlorobenzene sulfonic acid (a contaminant found in hazardous waste leachates) and also for nontarget pollutants in aqueous leachate samples from the Stringfellow hazardous waste site in California. Anion exchange chromatography coupled to inductively coupled plasma mass spectrometry yields qualitative and quantitative elemental analysis showing the presence or absence of key heteroatoms in organic pollutants including chlorine, other halogens, phosphorus and sulfur. POLYNUCLEAR AROMATIC HYDROCARBON (PAH) CONTENT OF ARCHIVED SEWAGE SLUDGES.
Lancaster Univ. (England). Inst. of Environmental and Biological Sciences.
S. R. Wild, S. P. McGrath, and K. C. Jones.
Chemosphere CMSHAF, Vol. 20, No. 6, p 703-716, 1990. 3 fig, 5 tab, 29 ref.

Descriptors: *Path of pollutants, *Polycyclic aromatic hydrocarbons, *Sludge analysis, *Sludge utilization, *Waste disposal, *Wastewater, Agriculture, Hydrocarbons, Land disposal, Sludge.

Twenty-nine anaerobically digested, lagoon dried sewage sludges were analyzed for polynuclear aromatic hydrocarbons (PAHs). These sludges had been applied to the plots of a long term agricultural experiment from 1942 to 1961. The exact dates of sludge production and treatment are unknown, although they are likely to be 1-5 years prior to sludge application dates. The sludges had a mean Sum-PAH (defined ad the sum of the compounds measured) concentration of 50 mg/kg, with a range of 18-125 mg/kg. The most abundant compound was benzo(ghi)perylene with a mean concentration of 10 mg/kg. A trend is apparent in the Sum-PAH content through time, increasing until 1948 to over 125 mg/kg, then decreasing to 29 mg/kg by 1961. These changes are tentatively attributed to changes in air quality and smoke emissions. The PAH content of contemporary sludges is also reviewed. There is little evidence to suggest that the PAH abundance in the London area has changed significantly from the 1960's to the present day. (Author's abstract)

FAILURE OF A DIAGNOSTIC MONOCLONAL IMMUNOFLUORESCENT REAGENT TO DETECT LEGIONELLA PNEUMOPHILA IN ENVIRONMENTAL SAMPLES.
Veterans Administration Medical Center, Pittsburgh, PA. Special Pathogens Section.
R. M. Vickers, J. E. Stout, and V. L. Yu.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2912-2914, September 1990. 1 tab, 10 ref.

Descriptors: *Fluorescence, *Hospitals, *Immunoassay, *Legionella, *Pathogenic bacteria, *Pollutant identification, Human pathogens, Potable water, Water distribution.

Three commercial diagnostic fluorescein-labeled antibodies, one monoclonal and two polyclonal, were compared to evaluate their abilities to detect Legionella pneumophila in environmental samples collected from 4 hospitals, one nursing home, and one industrial plant. The samples were taken from 9 hot and cold storage tank waters, three swabs from two showers and 1 faucet. The monoclonal conjugate failed to detect L. pneumophila in the 12 environmental samples studied by direct immunofluorescence. In contrast, the two polyclonal conjugates detected L. pneumophila in all 12 samples by both direct and indirect immunofluorescence. However, isolates recovered by culture from the 12 samples demonstrated equal immunofluorescence with all three conjugates. The reason for the failure of the monoclonal antibody to detect L. pneumophila in the environmental samples remains unknown. Laboratories considering the use of the monoclonal conjugate to screen environmental samples for L. pneumophila should be aware of this finding. (Author's abstract)

IMPROVED DETECTION OF ACID MINE WATER STRESSED COLIFORM BACTERIA ON MEDIA CONTAINING CATALASE AND SODIUM PYRUVATE.
West Virginia Univ., Morgantown. Div. of Plant and Soil Sciences.
J. P. Calabrese, and G. K. Bissonnette.
Canadian Journal of Microbiology CJMIAZ, Vol. 36, No. 8, p 544-550, August 1990. 2 fig, 4 tab, 37 ref.

Descriptors: *Acid mine drainage, *Coliforms, *Culture media, *Escherichia coli, *Pollutant identification, *Water pollution effects, Bioindicators, Culturing techniques, Enzymes, Heterotrophic bacteria, Membrane filters.

Pure culture suspensions of two strains of exponential and stationary phase Escherichia coli exhibited significant reductions in catalase activity following exposure to acid mine water (AMW). The exogenous addition of catalase (500-2000 U) or sodium pyruvate (0.05-5%) to a nonselective recovery medium resulted in enhanced detection (12-to 465-fold) of AMW-stressed E. coli as compared with recovery on the medium lacking these supplements, whereas addition of 3,3'-thiodipropionic acid failed to improve recovery. Additional in vitro experiments utilizing selective M-FC, mT7, and M-Endo media containing 1000 U catalase or 1.0% pyruvate similarly resulted in improved detection of AMW-stressed cells, with the exception of M-Endo containing pyruvate. Appropriately modified media were then used to analyze an AMW-impacted stream by the membrane filtration technique. Addition of catalase, pyruvate, or a combination of both significantly improved recovery of fecal and total coliforms without promoting growth of noncoliforms. Supplementation of plate count agar with pyruvate and/or catalase enhanced detection of total heterotrophs. These findings suggest that addition of catalase or pyruvate to standard recovery media may improve detection of coliform and total heterotrophic bacteria in AMW-impacted waters. (Author's abstract)

INDICATORS OF CHEMICAL POLLUTION FROM SEPTIC SYSTEMS.
Geraghty and Miller, Inc., Raleigh, NC.
B. J. Alhajjar, G. Chesters, and J. M. Harkin.
Ground Water GRWAAP, Vol. 28, No. 4, p 559-568, July/August 1990. 5 fig, 2 tab, 49 ref.

Descriptors: *Chlorides, *Conductivity, *Detergents, *Fluorescence, *Groundwater pollution, *Hydrogen ion concentration, *Pollutant identification, *Septic tanks, *Septic wastewater, *Water pollution sources, Effluents, Nitrates, Statistical methods, Water chemistry.

The median-polish statistical method was used to test and quantify chloride, electrical conductivity, pH and fluorescence of laundry detergent optical brighteners as indicators of groundwater pollution from septic systems. The septic systems were located in coarse-textured soils over a high water table close to discharge areas in south-central Wisconsin. Parameters were measured monthly for two years in septic tank effluent samples and in water samples collected downgradient from 17 septic systems and from upgradient background samples. The median-polish technique was excellent for comparing hydrochemical data: chloride was a conservative tracer and the most suitable indicator of contaminant plumes, electrical conductivity was semiconservative and electrical conductivity and pH were only acceptable; and fluorescence was unacceptable. Fluorescence as an optical brightener in septic tank effluents ranged between 0.14 and 0.98 mg/L with an average value of 0.40 +/-0.16 mg/L. In groundwater downgra-

LIBRARY U. OF I. URBANA-CHAMPAIGN

dient from the septic systems, fluorescence levels were within the background levels. Natural substances such as humic and fulvic acids were probably the sources of fluorescence in groundwater, not optical brighteners, because optical brighteners did not pass through septic systems drainfields. Fluorescence of naturally occurring compounds in groundwater was between < 0.01 and 260 microg/L with a mean of < or = 51 +/-14 microg/L expressed as optical brightener. Nitrification in the soil below the drainfields caused groundwater pH values to decrease within a few meters of the drainfields. (Author's abstract)

DETERMINATION OF TRACE QUANTITIES OF ORGANOTIN COMPOUNDS IN COASTAL WATERS OF GREECE BY GRAPHITE FURNACE ATOMIC ABSORPTION SPECTROMETRY.
Thessaloniki Univ., Salonika (Greece). Environmental Pollution Control Lab.
K. Fytianos, and V. Samanidou.
Science of the Total Environment STENDL, Vol. 92, p 265-268, March 1990. 1 tab, 12 ref.

Descriptors: *Analytical techniques, *Atomic absorption spectrophotometry, *Coastal waters, *Greece, *Marinas, *Organotin compounds, *Spectral analysis, *Tributyltin, *Water pollution, *Water pollution sources, Boats, Coastal environment, Coasts, Recreation facilities, Seasonal variation.

In recent years the growing use of antifouling paints containing organotin compounds of high toxicity has increased the possibility of pollution in areas of high pleasure-craft activity. The active biocides in these paints are bis(tributyltin) oxide (TBTO) and tributyltin chloride (TBTCL). Where the density of boats is greatest and exchange with open water is least, water concentrations have consistently exceeded those known to be toxic to a variety of marine organisms. Samples of surface seawater from marinas in Greece were examined for the presence of tributyltin compounds. Samples were collected at 3-month intervals over a 1-year period from 1987-1988. Trace concentrations of tributyltin in seawater were determined by graphite furnace atomic adsorption spectrometry using preconcentration by extraction into toluene. Seasonal trends in contamination coincided with boat usage patterns and peaked during summer months. Concentrations of TBT in seawater dropped significantly with increasing distance from the marinas; TBT was below detection limit (<5 ng/L) in the middle of Themaikos Gulf and in areas used for swimming. In Thessaloniki Harbor, the concentrations ranged between 25 and 115 ng/L and was clearly related to the high density of moorings and routes of major shipping traffic. The concentrations of organotin compounds in the examined areas were compared with those reported in the literature and are found to be similar to levels in slightly polluted areas. SAMPLING STRATEGIES FOR PARAMETER ESTIMATION IN GROUNDWATER QUALITY MANAGEMENT: THEORY AND FIELD VALIDATION.
California Univ., Los Angeles. Dept. of Civil Engineering.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-222258/AS. Price codes: A03 in paper copy, A01 in microfiche. Report UCLA-ENG-90-20, Feb 1990. 76p, 13 fig, 10 tab, 32 ref. USGS Contract No. 14-08-0001-G1499.

Descriptors: *Experimental design, *Field tests, *Groundwater pollution, *Optimization, *Sampling, Algorithms, Groundwater management, Mathematical models, Parameter estimation, Planning, Tracers.

The report is divided into two parts. In part I, an optimal design algorithm is developed to facilitate the planning and the optimal configuration and scheduling of a groundwater tracer test whose data are to be used to estimate model parameters. A maximal information criterion is used to select among competing designs. A zero-one integer heuristic is used to solve a simplified example for experiment configurations under a given experimental duration. The design considers the installation cost which is a function of location and depth of the observation well, as well as the samples themselves. The resulting designs are intuitively reasonable. It was found that a dramatic increase in information can be obtained with an experimental budget increase in a heterogeneous example case. Part II of the report describes a two-well field test conducted to estimate the retardation of organic contaminants during transport in groundwater at the Borden site, Ontario, Canada. One inorganic tracer and four organic solutes were injected for a period of 48 hours and their migration towards the extraction well monitored by 3 multi-level and 1 partially penetrating monitoring wells. The results of this forced gradient field test are analyzed and compared with the results from a previous natural gradient experiment and associated laboratory studies of the aquifer media. (USGS)

ACID PRECIPITATION: BIOLOGICAL MONITORING OF STREAMS AND LAKES.
Bergen Univ. (Norway). Zoological Museum.
A. Fjellheim, and G. G. Raddum.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 57-66, July 1990. 3 fig, 1 tab, 29 ref.

Descriptors: *Acid rain effects, *Invertebrates, *Monitoring, *Norway, *Water pollution effects, Acid streams, Benthic fauna, Buffer capacity, Fishkill, Model studies, Precipitation, Salmon.

The activities and results from the Norwegian invertebrate acidification monitoring program are summarized. The program was started in 1981 and includes five watersheds. A key tool in the invertebrate monitoring program is a model which calculates an acidification index based on acid-sensitive invertebrates. The model is presented together with the acidification tolerances limits for different invertebrates. The results show that the degree of damage due to acificiation differed over time and between watersheds. Generally, the watersheds in the southernmost parts of Norway were most acidified. In watersheds on the west coast, maximum acidification was measured in 1983 to 1984. This was correlated with episodic kills of young Atlantic salmon. During recent years, acidification has decreased in most rivers with the exception of those found in the southernmost regions. The rivers are, however, still vulnerable to acidification due to poor buffer capacity. (Author's abstract)

POLYCLONAL AND MONOCLONAL ENZYME IMMUNOASSAYS FOR PICLORAM DETECTION IN WATER, SOIL, PLANTS, AND URINE.
Guelph Univ. (Ontario). Dept. of Environmental Biology.
R. J. A. Deschamps, J. C. Hall, and M. R. McDermott.
Journal of Agricultural and Food Chemistry JAFCAU, Vol. 38, No. 9, p 1881-1886, September 1990. 1 fig, 7 tab, 17 ref.

Descriptors: *Bioassay, *Herbicides, *Immunoassay, *Pesticides, *Picloram, *Pollutant identification, Biological studies, Clopyralid, Fluroxpyr, Soil contamination, Triclopyr, Urine, Water pollution.

Two indirect enzyme immunoassays for picloram detection were compared in terms of sensitivity, accuracy and precision. The assay, using a rabbit antipicloram serum, had a linear working range from 5000 ng/mL with a mean 50I value of 140 ng/mL and a lower detection limit of 5ng/mL. The assay, using a monoclonal antibody obtained from a mouse hybridoma cell line, yielded a linear working range from 1 to 200 ng/mL with a mean 50I value of 10 ng/mL and a lower detection limit of 1 ng/mL. Neither assay showed appreciable cross-reactivity with the structurally related pyridine herbicides clopyralid, fluroxypyr, and triclopyr or with the phenoxyacetic acid herbicide 2,4-D. From the analysis of fortified river water, soil extracts, plant extracts, and urine, the monoclonal antibody based assay was shown to be more sensitive, more accurate and more precise than the polyclonal antiserum based assay. Only the monoclonal assay was suitable for quantitative determination of picloram. (Author's abstract)

BROAD-RANGE METHODS FOR DETERMINATION OF POLLUTANTS IN WASTEWATER.
Environmental Protection Agency, Washington, DC. Industrial Technology Div.
W. A . Tellard.
Journal of Chromatographic Science JCHSBZ, Vol. 28, No. 9, p 453-459, September 1990. 10 tab, 7 ref.

Descriptors: *Chemical analysis, *Laboratory methods, *Organic compounds, *Pollutant identification, *Wastewater analysis, *Water analysis, Atomic absorption spectrometry, Chlorinated hydrocarbons, Dioxins, Gas chromatography, Mass spectrometry, Metals.

The EPA is required by the Federal Water Pollution Control Act (FWPCA) and the Clean Water Act (CWA), and amendments thereto, to control or eliminate discharges of pollutants into waterways in the US, its territories and possessions. In controlling these discharges, the EPA's Industrial Technology Division (ITD) within the EPA's Office of Water Regulations and Standards (OWRS) has been given the responsibility of establishing effluent limits for any substance that may have an adverse effect on human health or the environment. The ITD determines the concentrations of pollutants at industrial plants in order to assess the performance of various water and waste treatment technologies. To determine the concentration of pollutants, ITD uses broad range analytical methods so that the largest number of pollutants can be measured at the lowest cost. At the same time, ITD must produce the most precise and accurate data possible so that the regulations most closely reflect the true value of the pollutants in wastewater. This paper gives technical details of Method nos.: 1620, which surveys 69 elements using inductively coupled plasma spectrometry (ICP), graphite furnace atomic absorption spectrometry (GFAA), and cold vapor atomic absorption (CVAA); 1613, which measures the tetra-, through octa-, chlorinated dibenzo-p-dioxins (CDDs) and chlorinated dibenzofurans (CDFs) using high resolution gas chromatography/mass spectrometry (HRGC-HRMS); Method 1618, which measures herbicides, PCBs, and organochlorine and organophosphorus pesticides using GC; and Method 1624, which determines purgeable or-

ganic compounds by calibrated isotope dilution or internal standard GC/MS. (Lantz-PTT)

SUPERCRITICAL FLUID EXTRACTION AND ITS APPLICATION TO ENVIRONMENTAL ANALYSIS.
Mid-Pacific Environmental Lab., Mountain View, CA.
V. L. Avila, N. S. Dodhiwala, and W. F. Beckert.
Journal of Chromatographic Science JCHSBZ, Vol. 28, No. 9, p 468-476, September 1990. 5 fig, 8 tab, 16 ref.

Descriptors: *Chemical analysis, *Chlorinated hydrocarbons, *Organophosphorus pesticides, *Pesticides, *Pollutant identification, *Supercritical gases, *Water analysis, Aromatic hydrocarbons, Comparison studies, Laboratory methods.

Sand, spiked with 41 organochlorine pesticides and 47 organophosphorous pesticides, was extracted with supercritical carbon dioxide at various pressures and temperatures, and the recoveries were determined. Two standard reference materials certified for polynuclear aromatic hydrocarbons were extracted under supercritical conditions, and the data compared with the certified values which have been determined by conventional extraction techniques. There is a large discrepancy between the resulting data and the certified values. To explain the discrepancy, a preliminary optimization study was conducted in which the influences on recoveries of seven variables were investigated. The study allowed for the estimation of the main effects of the seven variables; however, the authors could not test the statistical significance of any of these effects. Results from the preliminary method optimization experiments indicate that under the conditions used, recovery is most effected by extraction time and extraction pressure, followed by moisture content of the material and sample size. The approximate costs associated with setting up and using a supercritical fluid extraction system in an analytical laboratory are presented and are compared with those for Soxhlet extraction. (Author's abstract)

RAPID METHOD FOR THE SIMULTANEOUS ANALYSIS OF CHLORPYRIFOS, ISOFENPHOS, CARBARYL, IPRODIONE, AND TRIADIMEFON IN GROUNDWATER BY SOLID-PHASE EXTRACTION.
Massachusetts Pesticide Analysis Lab., Amherst.
J. W. Brooks, D. Tessier, D. Soderstrom, J. Hankins, and J. M. Clark.
Journal of Chromatographic Science JCHSBZ, Vol. 28, No. 9, p 487-489, September 1990. 3 fig, 2 tab, 7 ref.

Descriptors: *Carbaryl, *Chlorpyrifos, *Groundwater pollution, *Iprodiene, *Isofenphos, *Laboratory methods, *Pesticides, *Pollutant identification, *Triadimefon, Chemical analysis, Detection limits, Gas chromatography, Water analysis.

A method for the simultaneous analysis of pesticides in groundwater involves the extraction of the pesticides onto 18C columns and then elution with methylene chloride. After solvent exchange to hexane, the extracts are analyzed by gas chromatography using nitrogen-phosphorous detection. Recoveries average higher than 90% with a detection limit of 1 ppb for carbaryl, iprodione, and triadimefon, and 0.1 ppb for chlorpyrifos and isofenphos. (Author's abstract)

REVERSED-PHASE LIQUID CHROMATOGRAPHIC COLUMN SWITCHING FOR THE TRACE-LEVEL DETERMINATION OF POLAR COMPOUNDS. APPLICATION TO CHLOROALLYL ALCOHOL IN GROUND WATER.
Rijksinstituut voor de Volksgezondheid en Milieuhygiene, Bilthoven (Netherlands). Lab. for Organic-Analytical Chemistry.
E. A. Hogendoorn, A. P. J. M. De Jong, P. Van Zoonen, and U. A. T. Brinkman.
Journal of Chromatography JOCRAM, Vol. 511, p 243-256, July 1990. 6 fig, 3 tab, 24 ref.

Descriptors: *Chemical analysis, *Chromatography, *Groundwater pollution, *Laboratory methods, *Liquid chromatography, *Pollutant identification, *Water analysis, Chloroacrylic acid, Dichloropropene, Mass spectrometry, Trace levels, Ultraviolet radiation.

Reversed-phase liquid chromatographic (LC) column switching employing two 18C columns was used for the trace level determination of the polar compound chloroallyl (CAAL), a key metabolite of the soil sterilant dichloropropene, in groundwater. The selectivity of the LC procedure is crucial as CAAL does not possess a chromophoric group and must be detected by UV absorbance at 205 nm. It was shown that the selectivity can be enhanced considerably by the use of a column-switching technique. A completely automated procedure was developed for the determination of CAAL with a limit of detection (LOD) of 1 ppb (signal to noise ratio = 3). Recoveries at the 20 ppb level were 103% for cis-CAAL (relative standard deviation (R.S.D.) = 3.4%) and 102% for trans-CAAL (R.S.D. = 2.5%). Response was linear over more than two decades. The sample throughput is high, as the total time required for the analysis is less than 10 min. If necessary, LODs can be lowered to 0.1 ppb by means of a liquid/liquid extraction combined with a concentration step, resulting in recoveries of 88% (R.S.D. = 4.1%) at a level of 2 ppb. Confirmation of CAAL and a second metabolite of dichloropropene, chloroacrylic acid (CAAC), was performed by gas chromatography-negative ionization chemical mass spectrometry (GC-NCI-MS), using derivation procedures to convert CAAL and CAAC into their pentafluorobenzoyl derivatives, respectively. (Author's abstract)

TRACE DETERMINATION OF LOWER VOLATILE FATTY ACIDS IN SEDIMENTS BY GAS CHROMATOGRAPHY WITH CHEMICALLY BONDED FFAP COLUMNS.
Limnologisch Inst., Nieuwersluis (Netherlands). Vijverhof Lab.
C. A. Hordijk, I. Burgers, G. J. M. Phylipsen, and T. E. Cappenberg.
Journal of Chromatography JOCRAM, Vol. 511, p 317-323, July 1990. 3 fig, 3 tab, 18 ref.

Descriptors: *Chemical analysis, *Chromatography, *Fatty acids, *Gas chromatography, *Laboratory methods, *Pollutant identification, *Sediment analysis, *Volatile acids, Formic acid, Freshwater, Trace levels.

A capillary gas-liquid chromatography method was developed for the quantification of free lower volatile fatty acids (LVFA) in freshwater sediments. The method is based on the application of water-resistant FFAP (free fatty acid phase) columns and splitless injection. An important feature is the ability to determine LVFA directly at picomole levels in 1-3 microL of water without sample extraction, clean-up or derivatization. Continuous saturation of the carrier gas with formic acid in superfluous, making this method compatible with mass selective detection. The ability to study LVFA metabolism using stable isotope tracers is presented. The method allows for the measurement of well defined concentration profiles (4-70 microM) in sediment pore waters and is a good alternative to existing techniques for determining trace amounts of LVFA in very small volumes of organic-rich matrices. NOAA'S STATUS AND TRENDS MUSSEL WATCH PROGRAM: CHLORINATED PESTICIDES AND PCBS IN OYSTERS (CRASSOSTREA VIRGINICA) AND SEDIMENTS FROM THE GULF OF MEXICO.
Texas A and M Univ., College Station. Dept. of Oceanography.
J. L. Sericano, E. L. Atlas, T. L. Wade, and J. M. Brooks.
Marine Environmental Research MERSDW, Vol. 29, No. 3, p 161-203, 1990. 14 fig, 6 tab, 52 ref. National Oceanic and Atmospheric Administration contract 50-DGNC-5-00262.

Descriptors: *Bioindicators, *Chlorinated hydrocarbons, *Gulf of Mexico, *Mollusks, *Mussels, *Oysters, *Pesticides, *Sediment contamination, Bioaccumulation, DDD, DDT, Distribution patterns, PCB, Polychlorinated biphenyls.

Chlorinated pesticides and PCB's were analyzed in more than 590 oyster and sediment samples collected during 1986 and 1987, the first 2 years of the NOAA's Status and Trends Mussel Watch Program established to monitor the current status and temporal trends of these contaminants in the Gulf of Mexico. Chlorinated hydrocarbons in oysters and sediments presented similar distribution patterns; however, their concentrations in oysters were several times higher than the concentration detected in the surrounding sediments. Alpha-chlordane, trans-nonachlor and dieldrin were the most abundant non-DDT pesticides in both types of sample. The major fraction of DDT related compounds measured in oysters and sediment was DDD. Based on average PCB concentrations, penta-, hexa-, and tetrachlorobiphenyls were preferentially accumulated by oysters as compared to the average sediment composition. Although this study was designed to avoid known point-sources of contaminant inputs, the measured concentrations were, in general, within the range of concentrations previously reported for the Gulf of Mexico. After the first 2 years of this program, the geographical distribution of chlorinated hydrocarbons in oyters and sediments is well defined. In contrast, the temporal trends at the different sites are not clear. Continued sampling will allow the identification of long-term trends in concentrations of chlorinated hydrocarbons in the Gulf of Mexico. (Author's abstract)

GAS CHROMATOGRAPHY IN ENVIRONMENTAL ANALYSIS: AIMS AND CHALLENGES.
BASF A.G., Ludwigshafen am Rhein (Germany, F.R.). Aktiengesellschaft labor fuer Umweltanalytik und Okologie.
H. J. Neu.
Fresenius Zeitschrift fuer Analytische Chemie ZACFAU, Vol. 337, No. 6, p 583-588, July 1990. 9 ref.

Descriptors: *Chromatography, *Gas chromatography, *Pollutant identification, *Sensitivity analysis, *Water analysis, Automation, Mass spectrometry, Organic compounds, Phenols, Qualitative analysis, Quantitative analysis, Trace levels, Wastewater analysis.

Gas chromatography (GC) is currently still the most frequently used technique for determining trace organic compounds in environmental samples. Though GC is already a very highly developed technique, there is still a need for further improvements with respect to the reliability of qualitative and quantitative data and to the overall efficiency of the analysis procedure. Future development should concentrate on all aspects of automation in order to reduce manual work. This refers to automation of pre-chromatographic sample treatment steps such as enrichment, clean-up and derivatization procedures. The derivatization of phenols in water can be considerably simplified by using the reaction of many phenols with pentafluorobenzoylchloride that can be performed directly in alkaline aqueous solution. Using the reagent in a hexane solution, derivatization and extraction of the derivatives can be performed in a single step procedure. Then the organic phase is separated, the excess reagent is destroyed, the extract is dried and subjected to GC-analysis. The

LIBRARY U. OF L. URBANA-CHAMPAIGN

detection of phenols in wastewater at the picogram level can be performed by a simplification of the above procedure. Derivatization procedures for the determination of hydrophilic compounds in water can also simplify GC analysis. In addition, the sensitivity of GC analysis can be improved by refinements in mass spectrophotometric detector sensitivity. (Geiger-PTT)

TRACE GAS ANALYSIS USING THERMOANALYTICAL METHODS.
Gesamthochschule Wuppertal (Germany, F.R.). Fachbereich 9 - Analytische Chemie.
H. Hartkamp, J. Rottmann, and M. Schmitz.
Fresenius Zeitschrift fuer Analytische Chemie ZACFAU, Vol. 337, No. 7, p 729-736, August 1990. 7 fig, 23 tab, 13 ref.

Descriptors: *Analytical methods, *Calorimetry, *Pollutant identification, *Trace levels, Chemical reactions, Chlorinated hydrocarbons, Metal complexes, Qualitative analysis, Quantitative analysis, Sampling, Soil gases, Thermal properties, Water pollution.

There is an increasing demand for trace gas analytical information, especially in the fields of environmental protection, due to emissions from soil and water pollution. Most trace analytical procedures are costly, time-consuming and require highly qualified personnel to perform them. This difficulty can be overcome by the development of simple one-step procedures based on low price ready-for-use sampling units which can be processed with a minimum of manpower input while providing information of the required reliability. The measurement of caloric effects associated with the decomposition of the products resulting during the sampling step from a gas-solid reaction between the traces to be analyzed and suitable solid state reagents may provide such needed technology to overcome previous difficulties in trace analysis. Starting from properly prepared text gas mixtures, the gas-solid reactions of numerous amines, alcohols, aldehydes, ketones, hydrocarbons, and halogenated hydrocarbons with several metal complexes and with reagents capable of forming clathrates have been investigated by means of thermoanalytical methods, mainly by means of differential scanning calorimetry. Results show that in many cases the very simple thermoanalytical evaluation enables both qualitative identification and quantification of the gas traces under concern with satisfying selectivity. These reactions may serve as a promising basis for further development of fast, simple and reliable trace gas analyses using thermoanalytical methods. (Author's abstract)

GC-FTIRS: APPLICATIONS IN ORGANIC TRACE ANALYSIS.
Johannes Kepler Univ., Linz (Austria). Dept. of Analytical Chemistry.
H. Malissa, T. Kreindl, and K. Winsauer.
Fresenius Zeitschrift fuer Analytische Chemie ZACFAU, Vol. 337, No. 7, p 843-847, August 1990. 1 fig, 36 ref.

Descriptors: *Analytical methods, *Chemical analysis, *Chromatography, *Gas chromatography, *Organic pollutants, *Pollutant identification, *Trace levels, *Water analysis, Atrazine, Herbicides, Spectrophotometry.

The gas chromatography-infrared spectrophotometry (GC-FTIRS) coupling used as a measuring instrument in trace analytical procedures can be fully effective only if the maximum possible sensitivity is provided simultaneously with undistorted chromatographic and spectrometric representation of the eluted compounds. Great efforts have been made in recent years to design improved interfacing and measurement principles. GC capillary separation with flow-through gas cells (light-pipes), matrix isolation and cryodeposition techniques are discussed and compared in terms of sensitivity. The lightpipes achieves a sensitivity of between 1 and 10 nanograms for strong IR-absorbers, although 400 picograms have been attained in a precisely balanced system. For weak IR-absorbers, the quantity required may raise up to 100 nanograms. In the eluate trapping techniques, identifiable spectrum from 25 picograms has been obtained with the matrix isolation system for the model substance isobutyl methacrylate. The minimum identification concentration of a herbicide in groundwater and drinking water is approximately 1 ppb using an analytical procedure with solid state enrichment, large sample injection and GC-FTIRS with the light-pipe technique. DETERMINATION OF ORTHO-AND PYROPHOSPHATES IN WATERS BY EXTRACTION CHROMATOGRAPHY AND FLOW-INJECTION ANALYSIS.
Akademiya Nauk SSSR, Moscow. Inst. Geokhimii i Analiticheskoi Khimii.
B. Y. Spivakov, T. A. Maryutina, L. K. Shpigun, V. M. Shkinev, and Y. A. Zolotov.
Talanta TLNTA2, Vol. 37, No. 9, p 889-894, September 1990. 7 fig, 3 tab, 13 ref.

Descriptors: *Chromatography, *Orthophosphates, *Phosphates, *Pollutant identification, *Water analysis, Anions, Cations, Chemical analysis, Separation techniques, Spectrophotometry, Wastewater analysis.

Extraction-chromatographic separation of ortho- and pyrophosphate anions on an inert support modified with an organotin extractant was studied and used for their subsequent determination in a flow-injection analysis (FIA) system. The proposed FIA manifold included an extraction-chromatographic mini-column, on which the phosphate anions were separated and preconcentrated, and a post-column spectrophotometric detector. For the determination of orthophosphate, the absorbance of the reduced 12-molybdophosphoric acid was monitored at 660 nanometers. The sum of ortho- and pyrophosphate was determined after preliminary hydrolysis of pyrophosphate to orthophosphate in neutral solution at 50 C by use of inorganic pyrophosphatase. For a sample volume of 6 ml, the calibration graph was linear within a range of 5.0-100.0 nanograms/ml P. The limit of detection was 0.3 nanograms/ml P. The recovery of the ions to be determined was not less than 96%, the relative error was not worse than 4%. When the proposed method was used for the analysis of river water samples, the deviations between the amounts of phosphate ions found and added were within experimental error. Close agreement was also noted for results achieved with the present method and those obtained by the solvent extraction-spectrophotometric method. The FIA procedure developed can also be applied to the analysis of anions and cations in wastewaters. (Geiger-PTT)

The influence of sample preparation on measured concentrations of eight elements in the edible tissues of fish from two rivers in southeastern Missouri contaminated by mining and related activities was investigated. Concentrations of lead (Pb), cadmium (Cd), copper (Cu), zinc (Zn), iron (Fe), manganese (Mn), barium (Ba), and calcium (Ca) were measured in two skinless, boneless samples of axial muscle from individual fish prepared in a clean room. One sample (normally processed) was removed from each fish with a knife in a manner typically used by investigators to process fish for elemental analysis and presumably representative of methods employed by anglers when preparing fish for home consumption. A second sample (clean-processed) was then prepared from each normally-processed sample by cutting away all surface material with acid-cleaned instruments under ultraclean conditions. The samples were analyzed by atomic absorption spectrophotometry. Only Pb regularly exceeded current guidelines for elemental contaminants in food. Concentrations were high in black redhorse from contaminated sites, regardless of preparation method; for the other fishes, Pb levels depended upon preparation technique. Except for Mn and Ca, concentrations of all elements measured were significantly lower in clean than in normally precessed tissue samples. Concentrations of Pb, Ca, Mn and Ba in individual fish were closely correlated regardless of sample size, while correlations between Zn, Fe, and Cd occurred only in normally-processed samples (suggesting that these correlations resulted from high concentrations on the surfaces of some samples). Reported concentrations of certain elements should be regarded only as estimates and regardless of the care exercised during the collection, preparation, and analysis of samples, results should be interpreted with the awareness that contamination from external sources may have occurred. MUTAGENS, TOXICANTS, AND OTHER CONSTITUENTS IN SMALL CITY SLUDGES IN NEW YORK STATE.
Pennsylvania State Univ., University Park. Pesticide Research Lab.
R. O. Mumma, K. A. Rashid, D. C. Raupach, B. S. Shane, and J. M. Scarlet-Kranz.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 17, No. 5, p 657-663, September 1988. 1 fig, 3 tab, 18 ref.

Descriptors: *Chemical analysis, *Hazardous materials, *Municipal wastes, *Mutagens, *New York, *Pollutant identification, *Sludge analysis, *Toxicology, Land disposal, Polychlorinated biphenyls, Radiochemical analysis, Sampling, Surveys.

An analytical survey was conducted of sewage sludges from 15 small cites in New York State for mutagens, 44 elements, polychlorinated biphenyls (PCBs) and radioactivity. Using the Ames salmonella assay, low levels of mutagenicity were detected in several of the samples. PCBs were very high in only one sample, from the Elmira sewage plant (48.4 ppm). A number of toxic elements (i.e., arsenic, boron, barium, cadmium, chromium, copper, mercury, nickel, lead, antimony, and zinc) were found at elevated concentrations in specific sludges, but it is not possible to relate these to specific industrial sources with certainty. The concentrations of specific toxicants in five city sludges were above presently suggested federal guidelines for their suitability for land application. Gamma emission was comparatively low in all samples at 1.6 to 326 cpm per gram above background. Possible sources of specific constituents in sludge are discussed. The concentrations of various constituents in sludges may vary greatly, up or down, with time of sampling, therefore, continuous analytical monitoring for toxicants in sludges is necessary to calculate an average composition for a given period of time if federal guidelines are to be effectively followed. APPLICATIONS OF MAGNETIC MEASUREMENTS TO SEDIMENT TRACING IN URBAN HIGHWAY ENVIRONMENTS.
Middlesex Polytechnic, Enfield (England). Urban Pollution Research Center.
P. R. Beckwith, J. B. Ellis, and D. M. Revitt.
The Science of the Total Environment STENDL, Vol. 93, p 449-463, April 1990. 3 fig, 4 tab, 29 ref.

Descriptors: *Highway effects, *Magnetic studies, *Particulate matter, *Sediment transport, *Storm runoff, *Urban areas, *Urban runoff, Catchment basins, Data acquisition, Hydrology, Sediments.

Mineral magnetic techniques are used to follow the transport and sequencing of surface sediments through a separate stormwater system within a small, well-defined urban catchment. The contributions of these sediments to subsurface deposits and stormwater particulates have been assessed by consideration of magnetic parameter values, by comparison of graphical representations and by derivation of discriminatory equations. A realistic balance is achieved by consideration of each of these. For example, the discrimination procedure predicts that in-pipe deposits collected from below the confluence of the road and roof drainage systems are predominantly categorized as highway associated sediments whereas direct comparison of the appropriate magnetic parameters suggests contributions from both highways and roof areas depending on specific flow characteristics and source sediment loadings. Substantial proportions of the total magnetic mineral loading can occur in the initial stages of the storm events, with as much as 80% of the overall IRM sub 300mT (Isothermal Remanent Magnetization induced by generating a uniform field of 300 mT) loading being discharged in the first 20 minutes, and therefore, these early stages can be important in determining the dominant sediment sources for the overall event. Stormwater quality is shown to be strongly influenced by contributions from atmospheric particulates and the scouring of in-pipe deposits with the latter being dependent upon the dominant sources of stormwater sediment at the end of the preceding storm. INFLUENCE OF COMPLEXING AGENTS AND SURFACTANTS ON METAL SPECIATION ANALYSIS IN ROAD RUNOFF.
Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Sanitary Engineering.
L. M. P. Morrison, and T. M. Florence.
The Science of the Total Environment STENDL, Vol. 93, p 481-488, April 1990. 4 tab, 13 ref.

Descriptors: *Chemical analysis, *Heavy metals, *Highway effects, *Pollutant identification, *Sample preservation, *Sampling, *Surfactants, *Urban runoff, *Voltammetry, *Water analysis, Acidity, Cadmium, Copper, Ion exchange, Speciation, Zinc.

A combination of medium exchange and sample acidification techniques are used to calculate the individual effects of complexing agents and surfactants on the deposition and stripping steps in anodic stripping voltammetry (ASV) for copper, lead and cadmium from road and urban runoff. A simple acidification procedure is presented for determining the toxic fraction. ASV is used for the determination of copper in the presence of fulvic and humic acids and Triton X-100, for cadmium and lead in the presence of Triton X-100, and for lead and urban runoff samples. The major effects of both complexing agents and Triton X-100 are on the deposition step. In phosphate buffer pH 7.0., lead is deposited as lead (II), but is stripped as lead (IV), giving enhanced stripping peaks at pH 7.0, but not at pH 1.9. Triton X-100 caused a considerable decrease in the deposition of all three metals, and surfactants were the major cause of low differential pulse ASV (DPASV) labilities in the water samples. Despite these large effects on ASV metal speciation, 5 mg/L of Triton X-100 in the presence or absence of copper had no effect on the growth rate of Chlorella pyrenoidosa at pH 7.0. This result has important implications for the use of DPASV lability in estimating the 'toxic fraction' of a metal. Since surfactants in road runoff are the dominant factor in the decrease of ASV lability, but do not decrease metal toxicity toward aquatic test organisms, then ASV will seriously underestimate the toxic fraction. This study has demonstrated several potential problems in the application of ASV lability measurements to the estimation of the toxic fraction of a metal in road runoff samples. The use of membrane-coated electrodes or direct current with peak integration, rather than either differential pulse-, or square wave-ASV, will eliminate the effect of the stripping step on ASV lability, but surfactants will still influence deposition. The measurement required for toxicity studies, i.e., the effect of complexing agents on deposition, can be readily obtained by DPASV using two successive ASV-labile determinations in the same sample aliquot with a simple acidification procedure. APPLICATION OF MULTIVARIATE ANALYSIS FOR CHARACTERIZATION OF ORGANIC COMPOUNDS FROM URBAN RUNOFF.
Universidad Politecnica de Madrid (Spain). Escuela Tecnica Superior de Ingenieros de Caminos.
M. T. Bomboi, A. Fernandez, F. Marino, and E. Hontoria.
The Science of the Total Environment STENDL, Vol. 93, p 523-536, April 1990. 3 fig, 2 tab, 23 ref.

Descriptors: *Aliphatic hydrocarbons, *Fatty acids, *Hydrocarbons, *Multivariate analysis, *Organic compounds, *Pollutant identification, *Spain, *Urban runoff, Madrid, Mathematical analysis, Pollutants.

A one year study for determining the concentrations of aromatic and aliphatic hydrocarbons and fatty acids in urban runoff has been established in Madrid. Seasonal traffic and area variations were studied to calculate enrichment factors after which apportionment techniques were used. Hierarchical cluster analysis was used to identify urban runoff in homogenous classes. Squared euclidean distance was used as a measure to calculate the similarity between samples and the mean distance was employed as the fusion strategy to obtain the dendogram. Factor analysis was developed to determine sources of urban runoff pollutants. The Varimax rotation technique was chosen to resolve organic compound origins and obtain their profiles and contributions to the receptor site. The results show that pyrolytic, petrogenic and natural sources are the main components of hydrocarbons and fatty acids in urban runoff. (Author's abstract)

RECENT TAXONOMIC DISCOVERIES CONCERNING THE MUSSEL MYTILUS: IMPLICATIONS FOR BIOMONITORING.
Memorial Univ. of Newfoundland, St. John's. Dept. of Earth Sciences.
P. B. Lobel, S. P. Belkhode, S. E. Jackson, and H. P. Longerich.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 508-512, July/August 1990. 3 tab, 14 ref.

Descriptors: *Bioassay, *Bioindicators, *Marine pollution, *Mollusks, *Mussels, *Taxonomy, Growth rates, Mass spectrometry, Metabolism, Speciation.

The mussel Mytilus has been widely used as a bioindicator of marine pollution. Because of its wide distribution around the world, it has been possible to establish a global 'mussel watch' to monitor pollutants in the marine environment. Recent taxonomic discoveries based on studies of allozyme variation, however, have shown that Mytilus edulis is actually a complex consisting of three separate evolutionary lineages which deserve the ranks of separate species: the Atlantic Mytilus edulis, Mytilus galloprovincialis, and Mytilus trossulus. Many mussels previously classified as Mytilus edulis can be reclassified as either Mytilus galloprovincialis or Mytilus trossulus. In the present study, specimens of Mytilus edulis and Mytilus trossulus were collected from the same habitat and analyzed for the concentrations of 25 elements by inductively coupled plasma mass spectrometry. Mytilus trossulus had higher element concentrations than Mytilus edulis. Differences between the element concentrations of the two species were related to differences in growth rather than to any direct differences between the element metabolism of the species. Such differences could be corrected by standardizing the mussels to a fixed width/height ratio. In order to avoid errors in future monitoring programs, taxonomic variables should be considered. MULTIRESIDUE METHOD BY HIGH PERFORMANCE LIQUID CHROMATOGRAPHY-BASED FRACTIONATION AND GAS CHROMATOGRAPHIC DETERMINATION OF TRACE LEVELS OF PESTICIDES IN AIR AND WATER.
California Univ., Davis. Dept. of Environmental Toxicology.
J. N. Seiber, D. E. Glofelty, A. D. Lucas, M. M. McChesney, and J. C. Sagebiel.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 583-592, July/August 1990. 5 fig, 5 tab, 25 ref. NIEHS Grant No. ES04699.

Descriptors: *Air pollution, *Analytical methods, *Chromatography, *Gas chromatography, *High performance liquid chromatography, *Path of pollutants, *Pesticides, *Pollutant identification, *Water pollution, Carbamate pesticides, Organophosphorus pesticides, Silica gel fractionation, Solutes.

A multiresidue analytical method, accommodating chemicals over a broad range of polarities, is outlined for pesticides, transformation products, and related toxicants based upon high performance liquid chromatographic fractionation of extracted residue on a Partisil silica gel normal phase column followed by selective-detector gas chromatographic determination of components in each fraction. The HPLC mobile phase gradient (hexane to methyl t-butyl ether) gave good chromatographic efficiency, resolution, reproducibility and recovery for 61 test compounds, and allowed for collection in four fractions spanning polarities from low polarity organochlorine compounds (fraction 1) to polar N-methylcarbamates and organophosphorus oxons (fraction 4). The multiresidue method was developed for use with air samples collected on XAD-4 and related trapping agents, and water samples extracted with methylene chloride. Detection limits estimated from spiking experiments were generally 0.3 to 1 ng/c m for high volume air samples, and 0.01 to 0.1 microg/L for one liter water samples. The combination of silica gel HPLC fractionation with element selective GC determination appears to offer several advantages when combined in a multiresidue method. The HPLC fractionation gives clean separation on the basis of solute polarity, and fraction cuts may be tailored to meet the needs of a given analytical problem. This technique can analyze pesticides and related compounds in air and water samples. (Brunone-PTT)

METAL CONTENT OF FUNGAL SPOROCARPS FROM URBAN, RURAL, AND SLUDGE-TREATED SITES.
Pacific Northwest Forest and Range Experiment Station, Wenatchee, WA. Forestry Sciences Lab.
D. Zabowski, R. J. Zasoski, W. Littke, and J. Ammirati.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 372-377, July/September 1990. 1 fig, 4 tab, 24 ref.

Descriptors: *Fungi, *Path of pollutants, *Sludge, *Soil contamination, *Trace metals, *Washington, Cadmium, Copper, Food chains, Forests, Iron, Manganese, Nickel, Rural areas, Urban areas, Zinc.

Fungal sporocarps can influence metal cycling by the uptake of trace metals, which are then readily available for consumption and incorporation into higher food chain levels. This study was conducted to determine if increased sporocarp metal (Cd, Cu, Fe, Mn, Ni, Zn) concentrations occurred relative to substrate metal availability in rural, urban, and sludge-treated sites in western Washington state. Fungal fruiting bodies were collected from rural forests, from urban forests receiving point-source metal pollution and from forests that had been treated with municipal sewage sludge. Metal concentrations in fungal sporocarps were found to be significantly higher on sewage sludge-treated sites when all species were considered. Smelter pollution and serpentinite soil, however, were also found to elevate some metals to levels similar to those found at sludge-amended areas. Overall, individual species appear to be the most important factor for predicting metal uptake from impacted soils and possible inclusion into food chains. (Author's abstract)

AQUEOUS BEHAVIOR OF CHROMIUM IN COAL FLY ASH.
Battelle Pacific Northwest Labs., Richland, WA. Environmental Sciences Dept.
D. Rai, and R. W. Szelmeczka.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 378-382, July/September 1990. 5 fig, 3 tab, 14 ref. Electric Power Research Institute, Inc. Contract RP2485-08.

Descriptors: *Chromium, *Coal wastes, *Path of pollutants, Chemical analysis, Chemical reactions, Chromium compounds, Coal fly ash, Hydrogen ion concentration, Interstitial water.

Although the average Cr content in coal fly ash is fairly small, a total of approximately 17,000 mg of Cr contained in fly ash is disposed of on the land surface in the U.S. annually. Because Cr, especially Cr(VI), is hazardous even in small quantities, it is important to determine or predict pore-water Cr concentrations. Studies were conducted to determine the dominant reactions controlling aqueous Cr concentrations in four coal fly ashes. The fly ashes were adjusted to a range of pH values between 2 and 10. Cr was found to be present in these aqueous and solid phases as Cr(III). Because of the amorphous character of the important Cr(1lI) compounds ((Fe,Cr)(OH)3 and Cr(OH)3) and because of the very low total Cr content of the fly ashes (<0.025%), it was not possible to identify directly the Cr-containing compounds. However, an indirect technique for identifying Cr compounds, comparison of observed activities with those in equilibrium with known solid phases, and with those obtained after spiking the coal ash suspensions with Cr(1lI), suggested that Cr concentrations are controlled by (Fe,Cr)(OH)3(am) at low pH and by (Fe,Cr)(OH)3(am) and/or Cr(OH)3(am) at pH values greater than about 5. TEMPORAL SOLUBILITY TRENDS OF ALUMINUM AND IRON LEACHED FROM COAL SPOILS AND CONTAMINATED SOIL MATERIALS.
Kentucky Agricultural Experiment Station, Lexington. Dept. of Agronomy.
A. D. Karathanasis, Y. L. Thompson, and V. P. Evangelou.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 389-395, July/September 1990. 10 fig, 1 tab, 25 ref.

Descriptors: *Acid mine drainage, *Aluminum, *Coal spoil, *Iron, *Path of pollutants, Kentucky, Leaching, Sediment contamination, Soil columns, Soil contamination, Solubility, Watersheds.

Column leaching experiments were conducted over a period of 5 months on selected spoil, soil, and sediment samples collected from acid mine watersheds with low buffering capacity in Kentucky. Evaluation of effluent compositions over time suggested that at different stages of leaching these samples may release different levels of Al and Fe. These levels appeared to be controlled by the solubility of characteristic sequences of basic Al-sulfate, Al-hydroxide, and alumino-silicate minerals, or Fe-sulfate and Fe-hydroxide minerals, which are sample specific. Jurbanite-jurbanite, jurbanite-alunite, and jurbanite-alunite-microcrystalline gibbsite appeared to be the dominant mineral species controlling the solubility of Al. Similarly, the jarosite-amorphous Fe(OH)3 and amorphous Fe(OH)3-geothite sequences appeared to control the solubility of Fe. Alternating water saturation and desaturation cycles appeared to cause more drastic changes in the above relationships than different flow rates simulating rain events of different intensity. The findings suggest that understanding temporal relationships among the sequence of mineral phases controlling Al and Fe solubility is essential for realistic modeling of Al and Fe release into aquifers. VIRUS TRANSPORT AND SURVIVAL IN SATURATED AND UNSATURATED FLOW THROUGH SOIL COLUMNS.
Arizona Univ., Tucson. Dept. of Soil and Water Science.
D. K. Powelson, J. R. Simpson, and C. P. Gerba.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 396-401, July/September 1990. 4 fig, 4 tab, 36 ref. USEPA CR-81147.

Descriptors: *Groundwater pollution, *Path of pollutants, *Viruses, *Water pollution, Saturated flow, Soil adsorption, Soil columns, Survival, Unsaturated flow.

Water with entrained disease-causing virus entering soil normally passes through water saturated and unsaturated regions before reaching the groundwater. The effects of saturated and unsaturated flow on the survival and transport of a virus, MS-2 bacteriophage, were compared. The viruses were added to well water and applied to soil columns 0.052 m in diameter and 1.05 m long. The soil material was Vint loamy fine sand (a sandy, mixed, hyperthermic Typic Torrifluvent) mixed with recent alluvium. Samples of the soil water were taken daily at 0.20, 0.40, and 0.80 m depths through stainless steel samplers and at 1.05 m from the percolate leaving the column. For saturated flow the virus concentrations reached the influent concentration in less than two pore volumes (PV). For unsaturated flow the concentrations remained at levels much lower than the influent, ranging from 27% of inflow at 0.20 m (18 PV) to 5% at 1.05 m (3.3 PV). At the end of the experiments soil samples from each depth were assayed to determine virus adsorption to the soil. The average distribution coefficient of the unsaturated columns, 0.27, indicates very little adsorption. The number balance showed that only 39% of the unsaturated flow virus were accounted for. It appears that under unsaturated flow conditions enhanced inactivation of this virus occurs. (Author's abstract)

NUTRIENT EXPORT IN STORMFLOW FOLLOWING FOREST HARVESTING AND SITE-PREPARATION IN EAST TEXAS.
Agricultural Research Service, Boise, ID. Northwest Watershed Research Center.
W. H. Blackburn, and J. C. Wood.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 402-408, July/September 1990. 4 fig, 4 tab, 31 ref.

Descriptors: *Clear-cutting, *Forest management, *Nutrient transport, *Water pollution sources, Agricultural practices, Field tests, Small watersheds, Storm runoff, Texas, Water quality, Water quality monitoring.

In December 1979 nine small (2.57 to 2.79 ha) watersheds in East Texas were instrumented to determine the effects on stormflow water quality of: (1) clearcutting, shearing, windrowing, and burning; (2) clearcutting, roller chopping, and burning; and (3) undisturbed control. Nutrient losses and concentrations, pH, electrical conductivity, and turbidity were not significantly different for all pre-treated watersheds. The first year following harvesting and site preparation, most nutrient losses and concentrations were greater from the sheared and cropped watersheds than from the undisturbed watersheds. Most nutrient losses and concentrations during the second and third post-treatment years were not significantly different from the chopped and undisturbed watersheds, but continued to be significantly greater from the sheared watersheds than from chopped or undisturbed watersheds. During the fifth post-treatment year all nutrient levels except for K(+) losses were not significantly different for all treatments. Although nutrient losses from all treatments were small, shearing and windrowing had the greatest impact on nutrient export. Roller chopping as applied in this study had a minimal impact on stormflow nutrient losses and should not degrade water quality. (Author's abstract)

BATCH LEACHING STUDIES OF RUNDLE OIL SHALE.
Commonwealth Scientific and Industrial Research Organization, North Ryde (Australia). Div. of Coal Technology.
D. R. Jones.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 408-413, July/September 1990. 3 fig, 4 tab, 16 ref.

Descriptors: *Arsenic, *Australia, *Oil shale, *Oil wastes, *Path of pollutants, *Trace metals, Batch tests, Hydrogen ion concentration, Kerosene Creek, Leachates, Rundle prospect, Solid wastes, Telegraph Creek.

Disposal of overburden, waste shale, and retorted shale may pose a significant environmental problem in the commercial exploitation of the oil shale in the Rundle prospect near Gladstone, Australia. The leaching of Fe, Mn, Al, Zn, Cd, Pb, Ni, Cu, As, and Se from samples of raw and retorted Kerosene Creek seam oil shale and Telegraph Creek seam claystone from the Rundle oil shale deposit was studied over the pH range 2 to 9.5. Low pH values were used to simulate the effects of possible acidification that might occur by oxidation of pyrite contained in the solids. The variation in leachate composition with pH highlighted the shortcomings of any batch test that seeks to categorize the behavior of a waste material solely on the basis of extraction at a single pH value. In this context, the results provided by the Resource Conservation and Recovery Act (RCRA) toxicity and American Society for Testing and Materials (ASTM) leach tests were compared. The RCRA test would not have identified As as being a potential problem in leachate from the retorted shale, because, at pH 5, this element (in the form of arsenate) is strongly absorbed by the shale matrix. The natural pH of a slurry of this waste is, however, greater than 9. Under these conditions, As is the trace element present in the highest concentrations in the leachate. (Author's abstract)

DISSOLVED AND SUSPENDED SOLIDS TRANSPORT FROM COASTAL PLAIN WATERSHEDS.
Agricultural Research Service, Tifton, GA. Southeast Watershed Research Lab.

R. K. Hubbard, J. M. Sheridan, and L. R. Marti.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 413-420, July/September 1990. 5 fig, 1 tab, 30 ref.

Descriptors: *Dissolved solids, *Georgia, *Path of pollutants, *Sediment transport, *Suspended solids, *Water pollution sources, *Water quality, Base flow, Coastal plains, Sediment concentration, Sediment load, Small watersheds, Surface runoff.

Excessive amounts of dissolved or suspended solids in surface runoff or base flow may degrade the quality of streams, lakes, or other water bodies. Loads of dissolved or suspended solids in streamflow reflect the quality of water entering via surface runoff or base flow. This study was conducted to determine the concentrations and loads of dissolved and suspended solids in Coastal Plain streamflow; to examine relationships between concentrations. loads, and flow rate; and to determine overall streamflow water quality for these parameters. Dissolved solids and suspended sediment concentrations were determined on weekly or high flow storm event streamflow samples collected at gaging stations on three subwatersheds (B, 334.3 sq km; F, 114.9 sq km; and k, 16.7 sq km) of the Little River Watersheds located near Tifton, Georgia. Dissolved solids concentrations ranged from 19 to 59 mg/L, and generally decreased as per unit area instantaneous discharge rate increased. Suspended sediment concentrations ranged from 1 to 137 mg/L, and generally increased as per unit area discharge rate increased. Regression analyses showed strong correlation between log transforms of both dissolved solids load and suspended sediment load versus total monthly runoff (correlation coefficients of 0.97 and 0.79, respectively). Mean suspended sediment concentrations during high flow events were greater than means from the overall data set, while mean concentrations of dissolved solids were reduced relative to the overall data set. The results showed that dissolved solids are the major component of total solids in Coastal Plain streamflow. The mean dissolved and suspended sediment concentrations during the study were 67, 9, and 51 mg/L; and 14, 17, and 14 mg/L for watersheds B, F, and K, respectively. Overall, it was demonstrated that, as measured on these watersheds, Coastal Plain streamflow is of good quality in terms of both dissolved and suspended solids. This good quality may reflect land use practices designed to prevent soil erosion, but primarily reflects the Coastal Plain landform shape, which causes sediments eroded from the uplands to be deposited in the riparian zone before they can enter the streamflow. FECT OF CONVENTIONAL VS. NO-TILLE ON PESTICIDE LEACHING TO SHALW GROUNDWATER.
ricultural Research Service, Beltsville, MD.
R. Isensee, R. G. Nash, and C. S. Helling.
rnal of Environmental Quality JEVQAA, Vol. No. 3, p 434-440, July/September 1990. 6 fig, 1 23 ref.

criptors: *Agricultural practices, *Groundwatollution, *Maryland, *No-till cultivation, *Path pollutants, *Pesticides, Beltsville, Confined undwater, Leaching, Monitoring wells, Rainfall act, Tillage, Unconfined groundwater.

eld site was established at Beltsville, Maryland, 986 to assess the effect of conventional and nocultural practices on the movement of pesti- s into shallow groundwater. Groundwater ples taken from unconfined (<1.5 m deep) and fined (>3 m deep) monitoring wells in 1986- were analyzed for atrazine, deethylatrazine, hlor, cyanazine, and carbofuran. Atrazine was d in groundwater all year, while cyanazine, alachlor, and carbofuran were present only for a short period (<3 mo) after pesticide application. Fairly constant background levels of <0.5 microg/L atrazine were found under fields treated before 1986, while levels under continuously treated fields were <2.0 microg/L for 22 of 25 samplings. Pesticide residues in unconfined groundwater were usually higher (ca. 2 to 4 fold) than in confined groundwater. Rainfall timing relative to pesticide application was critically important to pesticide leaching. A prolonged rain immediately after the 1988 application resulted in peak atrazine and cyanazine levels ca. 200 microg/L in unconfined and 30 to 40 microg/L in confined groundwater, which resulted in short term levels 2 to 50 fold greater under no-till than conventional till plots. The results suggest that preferential transport occurred. (Author's abstract)

NITRATE CONTAMINATION OF GROUNDWATER UNDER IRRIGATED COASTAL PLAIN SOILS.
Maryland Univ., College Park. Dept. of Agronomy.
R. R. Weil, R. A. Weismiller, and R. S. Turner.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 441-448, July/September 1990. 3 fig, 7 tab, 12 ref.

Descriptors: *Groundwater pollution, *Nitrates, *Nonpoint pollution sources, *Path of pollutants, *Water pollution sources, Agricultural runoff, Coastal plains, Denitrification, Fertilizers, Forests, Irrigation effects, Leaching, Manure, Maryland, Monitoring wells, Seasonal variation.

To develop best management practices (BMP) for agricultural land to protect groundwater, data is needed on the leaching of N from irrigated coastal plain soils treated with poultry manure. This study was conducted to determine the vertical and seasonal patterns of nitrate leaching under such soils. Four commercially farmed corn (Zea mays L.) fields were studied, two receiving only fertilizer N (240-360 kg N/ha over a two year period) and two with a continuing history of poultry manure applications (25-29 Mg/ha over 2 yr). In each field, a transect of four monitoring wells was installed 4 to 8 m deep (1 m below the seasonally low water table). Three additional wells were installed in forestland adjacent to three of the fields. Groundwater and soils (to 1.5 m depth) were periodically sampled for analysis of nitrate N. Under the unmanured field, groundwater nitrate N concentrations averaged 15.1 mg/L during August through November 1986, while the corresponding figure for the manured fields was not significantly different at 18.3 mg/L. Two months after spreading manure in November and December, as much as 104 mg/L nitrate N was measured in the groundwater under the manured fields. From December 1986 through September 1987 the groundwater under the manured fields had significantly higher nitrate N concentrations than did that under the unmanured fields (43.7 vs. 18.1 mg/L, respectively). Only for one well site with a buried A horizon did high Cl to nitrate N ratios and low nitrate N concentrations indicate rapid denitrification. The forestland groundwater always contained <1 mg/L nitrate N, and high Cl to nitrate N ratios, suggesting that nitrate in the cropland groundwater was lost after entering the forested areas, and that forests may therefore protect waterways from subsurface N contamination. NITRATE LEACHING FROM SYSTEMATICALLY TILED POTATO FIELDS IN NEW BRUNSWICK, CANADA.
Agriculture Canada, Fredericton (New Brunswick). Research Station.
P. Milburn, J. E. Richards, C. Gartley, T. Pollock, and H. O'Neill.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 448-454, July/September 1990. 2 fig, 5 tab, 34 ref.

Descriptors: *Agricultural runoff, *Crops, *Drainage, *Nitrates, *Nonpoint pollution sources, *Path of pollutants, *Water pollution sources, Canada, Fertilizers, Leaching, Mineralization, New Brunswick, Nitrogen, Potatoes, Seasonal variation, Water quality.

Flow volumes and nitrate N concentrations of drain discharge from five systematically tiled, commercial potato (Solanum tuberosum L.) fields were measured from April to December, 1987 and 1988 to assess the potential for nitrate N leaching associated with current production practices. The sites, located in New Brunswick, Canada, ranged from 3 to 10 ha and varied in fertilizer application rate, cropping practices, rainfall, and duration of data collection (the last due to site access difficulties in the spring). Three of the five sites were representative of intense potato rotations, whereas the remaining two were representative of land conversions into potato production from more passive, low input production systems. Ten site-years of data were collected. Drain outflow volumes averaged 75 and 115 mm per unit area in 1987 and 1988, respectively. Considerable drain flow occurred during snowmelt each year before data collection began. Measured nitrate N concentrations ranged from 1 to 65 mg/L and there were substantial variations within flow events. The flow weighted average annual nitrate concentrations of the drainage effluent were greater than or equal to 10 mg/L for potato site-years, regardless of whether the sites were established potato rotation fields or not. The flow weighted nitrate concentrations of the established potato rotation sites also remained >10 mg/L for the first non-potato year following a potato year. The flow weighted nitrate concentration of one potato rotation site was more than double that of the other two sites. Incubation studies showed that the soil at this site had considerably more potential to mineralize N than the other two sites. Total nitrate N leaching for the potato site-years for the measured April to December periods ranged from 5 to 33 kg N/ha. More work, under controlled conditions, is required to determine both dormant and growing season nitrate N leaching associated with various potato production systems. (Author's abstract)

LEACHING OF RADIONUCLIDES FROM DECAYING BLUEBERRY LEAVES: RELATIVE RATE INDEPENDENT OF CONCENTRATION.
Atomic Energy of Canada Ltd., Pinawa (Manitoba). Whiteshell Nuclear Research Establishment.
S. C. Sheppard, and W. G. Evenden.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 464-469, July/September 1990. 1 fig, 2 tab, 24 ref.

Descriptors: *Food chains, *Leaching, *Path of pollutants, *Radioisotopes, *Sediment transport, Cesium radioisotopes, Decomposition, Iodine radioisotopes, Leaves, Mathematical models, Radiochemical analysis, Selenium radioisotopes, Uranium radioisotopes, Vegetation effects.

Leaching of radionuclides from decaying vegetation has not been extensively investigated, especially for radionuclides other than Cs-137. Leaves of blueberry (Vaccinium angustifolium x V. corymbosum) were obtained that contained over 25-fold ranges in Se, Cs, and I concentrations, as well as a small quantity of leaves containing detectable U. All were contaminated by way of root uptake. Leaching took place for a period of 1 yr in the laboratory using leach water from forest litter. Monthly measurements were made of the radionuclide contents and decaying leaf dry weights. The data conformed to an exponential decay model with two first-order components. In no case did the relative loss rates vary systematically with the initial tissue radionuclide concentrations. Loss rates decreased in the order Cs>I>U>dry wt>Se. Because of the low leaching rate of Se

LIBRARY U. OF I. URBANA-CHAMPAIGN

relative to the loss of dry weight, decaying litter may actually accumulate elements such as Se. Accumulation of radionuclides in litter could have important implications for lateral transport, recycling, and direct incorporation into edible mushrooms. (Author's abstract)

AEROBIC AND ANAEROBIC DEGRADATION OF ALACHLOR IN SAMPLES FROM A SURFACE-TO GROUNDWATER PROFILE.
Agricultural Research Service, Stoneville, MS. Southern Weed Science Lab.
J. V. Pothuluri, T. B. Moorman, D. C. Obenhuber, and R. D. Wauchope.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 525-530, July/September 1990. 2 fig, 4 tab, 26 ref.

Descriptors: *Alachlor, *Biodegradation, *Fate of pollutants, *Georgia, *Herbicides, *Soil contamination, Aerobic conditions, Anaerobic conditions, Aquifer testing, Microbial degradation, Plains, Vadose zone.

Estimates of pesticide degradation rates in subsoils are needed to improve models predicting pesticide movement to groundwater. Biodegradation rates of the herbicide alachlor (2-chloro-(2,6-diethylphenyl)-N-(methyoxymethyl)acetamide) in surface soil, vadose zone, and aquifer samples collected from a single site near Plains, Georgia were determined in the laboratory under aerobic and anaerobic conditions. Degradation was described by first-order kinetics during 126 d of incubation. Under aerobic conditions the halflife of alachlor in the surface soil (23 d) was less than in the vadose zone (73-285 d) and aquifer samples (320-324 d). Alachlor in anaerobic samples degraded less rapidly in the surface (0 to 0.6 m) and the next deepest (0.6 to 2.4 m) subsoil than under aerobic conditions (halflife of 100 and 144 d, respectively). Degradation in anaerobic aquifer samples was very slow (halflife of 337 to 553 d). Addition of organic nutrients enhanced aerobic degradation in subsurface soils and one aquifer sample, indicating that nutrient availability limits biodegradation. Total aerobic microbial populations ranged from 6.6 x 10(3) to 2.5 x 10(6) cells per gram of soil in the subsoils and aquifer samples, but were not correlated with aerobic or anaerobic degradation rates. The lower degradation rates in vadose zone and aquifer materials may be due to less microbial activity or the absence of alachlor degraders. (Author's abstract)

METOLACHLOR TRANSPORT IN SURFACE RUNOFF.
Trent Univ., Peterborough (Ontario). Dept. of Geography.
J. M. Buttle.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 531-538, July/September 1990. 7 fig, 5 tab, 23 ref.

Descriptors: *Agricultural runoff, *Herbicides, *Metolachlor, *Ontario, *Path of pollutants, *Water pollution, Adsorption, Agricultural practices, Canada, Sediment contamination, Soil contamination, Surface runoff, Transport.

In 1987 metolachlor (2-chloro-N-(2-ethyl-6-methylphenyl) -N-(2-methoxy-1-methylethyl) acetamide) was applied to a 5.5 ha corn field in southern Ontario, Canada, in two separate areas: as a preemergence surface spray with cross-contour plowing and as a pre-plant incorporated treatment with contour plowing. The application rate for both treatments was 2.64 kg a.i./ha. Metolachlor concentrations in soils and in the dissolved and absorbed phases in runoff from natural rainstorms were monitored throughout the growing season. Persistence in soils decreased exponentially after application although there was evidence of temporary accumulation of metolachlor in footslope areas. Dissolved concentrations in runoff decreased with time while temporal trends in adsorbed concentrations reflected changes in metolachlor persistence in soils. Average ratios of adsorbed to dissolved herbicide concentrations ranged from 7 to 57, and were dependent upon hydrological and pedologic conditions within the treatments. Sediment carried between 9 to 58% of the total metolachlor yield from runoff plots during individual storms, and 20 to 46% of the total yield over the monitoring period. Herbicide incorporation and contour plowing led to significant reductions in dissolved and adsorbed concentrations, and in total metolachlor loss in runoff, relative to application as a preemergence spray with cross-contour plowing. Incorporation was associated with an increase in the relative importance of sediment in metolachlor transport. Variations in herbicide losses and the relative importance of transport vectors within a given treatment were linked to local hydrological processes. (Author's abstract)

ATRAZINE AND BROMIDE MOVEMENT THROUGH A SILT LOAM SOIL.
Agricultural Research Service, Beltsville, MD. Environmental Chemistry Lab.
J. L. Starr, and D. E. Glotfelty.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 552-558, July/September 1990. 7 fig, 2 tab, 16 ref.

Descriptors: *Agricultural chemicals, *Agricultural practices, *Atrazine, *Bromides, *Leaching, *Path of pollutants, *Pesticides, Cultivation, Groundwater pollution, Soil cores, Soil types, Tillage.

The movement of agrochemicals through soil to groundwater is affected by soil properties, soil management, timing of leaching events, and kinetics of the transformation processes. This study was conducted to determine the pattern(s) of movement of Br and atrazine (2-chloro-4-ethylamino-6-isopropylamino-1,3,5-triazine) through a field soil as affected by plow-till and conservation-till corn (Zea mays L.) under severe leaching conditions. The soil surface inside double-ring infiltrometers was sprayed with chemicals. One week later 10 cm of solution was applied under ponded flow conditions, and soil cores removed the next day for chemical analysis. The distribution patterns of Br and atrazine with soil depth were quite similar, with the largest proportion of the chemicals observed in the surface horizon, yet all cores showed some movement of chemicals to the deepest sampling depth (90 cm). However, on average <50% of the applied water, Br, and atrazine could be found. Two quite different processes seem to be involved in the movement of these chemicals through this soil: one-dimensional movement through the soil matrix and rapid downward movement through macropores which bypassed most of the soil matrix. The data suggest that the leaching losses of agrochemicals during the typical leaching season in eastern regions of the U.S. (fall to spring), may not be greatly affected by tillage. SORPTION OF NAPROPAMIDE ON CLAY AND SOIL IN THE PRESENCE OF DISSOLVED ORGANIC MATTER.
National Taiwan Univ., Taipei. Dept. of Agricultural Chemistry.
D.-Y. Lee, W. J. Farmer, and Y. Aochi.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 567-573, July/September 1990. 3 fig, 5 tab, 14 ref.

Descriptors: *Napropamide, *Organic matter, *Path of pollutants, *Pesticides, *Soil contamination, *Sorption, Clays, Dissolved solids, Isotherms, Nonionic pesticides, Sediments, Soil types.

Dissolved organic matter (DOM) can affect the distribution of solutes between solution and sorbed phases and the availability and environmental fate of the solutes. Batch sorption isotherm techniques were used to evaluate solute-solute and solute-sorbent interactions that control the effects of DOM on the sorption of a nonionic, moderately polar organic solute by solid sorbents. The sorption of napropamide (2-(alpha-naphthoxy-N,N-diethyl propionamide) by Na-, Cu-, and Al-montmorillonite decreased when dissolved humic acid derived from peat was present in the slurry. For Na-montmorillonite, the effect of DOM on sorption was reduced when a dialysis membrane prevented the contact between the DOM and the clay. This suggests that competition for sorption sites on the clay between DOM and the pesticide contributed to decreased napropamide sorption. The extent of the DOM effect was also dependent on the concentration and the source of DOM added. In contrast to the montmorillonite system, the effect of DOM on napropamide sorption by soil was observed only when the dialysis membrane was present or when the dissolution of native organic matter from the sorbate surface itself was enhanced by increasing the pH of the slurry system. These results demonstrate that the effect of DOM on the sorption of nonionic pesticides by soils and sediments can be a function of the association of DOM with pesticides in the solution phase, interactive forces of both DOM and the pesticide with the sorbent surface, and the nature of the sorbent surface. (Author's abstract)

BEHAVIOR OF TOLUENE ADDED TO SLUDGE-AMENDED SOILS.
New Mexico State Univ., Las Cruces. Dept. of Agronomy and Horticulture.
Y. Jin, and G. A. O'Connor.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 573-579, July/September 1990. 5 fig, 3 tab, 22 ref. USEPA Cooperative Agreement CR-812687-02.

Descriptors: *Fate of pollutants, *Organic compounds, *Path of pollutants, *Sludge utilization, *Soil contamination, *Toluene, Adsorption, Organic carbon, Sludge, Sludge-treated soils, Soil types, Volatilization, Waste disposal.

Toluene is a priority pollutant that can be introduced to soils in a variety of wastes, including some municipal sludges. Laboratory experiments were conducted to study the behavior of toluene in two soils in the presence and absence of municipal sludge. Sludge additions increased toluene adsorption in two soils because of increased organic C content. The source of organic C (soil or sludge) and soil clay content also influenced toluene adsorption. Toluene adsorption-desorption was reversible in one soil, but slightly hysteretic in the other soil. An air-flow incubation system was used to evaluate toluene volatilization and degradation. The primary fate of surface-applied toluene in both soils was volatilization. Toluene volatilization rates were independent of sludge treatments. Toluene degradation was negligible in all treatments because of rapid volatilization losses. Despite increased toluene adsorption in the presence of sludge and reduced volatilization in saturated soils, gaseous transfer dominated all soils and treatments so that no toluene remained after 10 d. (Author's abstract)

EFFECT OF MUNICIPAL SEWAGE SLUDGE APPLICATION ON GROWTH OF TWO REVEGETATION SHRUB SPECIES IN COPPER MINE SPOILS.
Brigham Young Univ., Provo, UT. Dept. of Agronomy and Horticulture.
B. R. Sabey, R. L. Pendleton, and B. L. Webb.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 580-586, July/September 1990. 7 tab, 46 ref.

Descriptors: *Bioaccumulation, *Heavy metals, *Path of pollutants, *Plant growth, *Sludge, *Sludge utilization, *Waste disposal, Copper mine spoils, Grasses, Growth rates, Land reclamation, Nutrients, Shrubs, Soil management.

Municipal sludge has been used for many years to improve chemical, physical, and biological properties of agricultural soils. One-year old transplants of fourwing saltbush (Atriplex canescens (Pursh) Nutt.) and mountain big sagebrush (Artemisia tridentata ssp. vaseyana (Rybd.) Beetle) were grown for 9 mo in large greenhouse pots containing copper mine spoil material amended with one of three rates of municipal sewage sludge. Sludge was thoroughly mixed with the soils in some pots and concentrated around the root plug in others. Additionally, some pots were seeded with western wheatgrass (Agropyron smithii Rydb.) to determine whether the presence of grasses would affect shrub response to sludge addition in low pH copper mine spoils. Growth of fourwing saltbush was enhanced from 38-fold to over 300-fold by the addition of sewage sludge. Growth of big sagebrush was increased over six-fold. This was likely the result of increased N, P, and K availability although improved biological and physical properties of the spoil-sludge mix may also have been factors. The addition of western wheatgrass to pots containing fourwing saltbush caused a decrease in shrub growth, undoubtedly due to competition for nutrients and other plant growth factors. At the conclusion of the study, shrub leaves contained high levels of Cd and Pb, reflecting the high Cd and Pb content of the growth medium. Zn, Cu, Mn, and Fe levels were also largely higher than are typical for plant tissue. Shrubs grown in pots in which sludge additions were concentrated around the root plug accumulated more heavy metal than did mixed treatments. Grass tissue did not accumulate excessively high quantities of heavy metals, with the exception of Cu. (Author's abstract)

ADSORPTION, DEGRADATION, AND PLANT AVAILABILITY OF 2,4-DINITROPHENOL IN SLUDGE-AMENDED CALCAREOUS SOILS.
New Mexico State Univ., Las Cruces. Dept. of Agronomy and Horticulture.
G. A. O'Connor, R. J. Lujan, and Y. Jin.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 587-593, July/September 1990. 2 fig, 4 tab, 14 ref. U.S. EPA Cooperative Agreement CR-812687-02.

Descriptors: *Biodegradation, *Dinitrophenol, *Fate of pollutants, *Organic compounds, *Path of pollutants, *Sludge, *Sludge utilization, *Soil contamination, Adsorption, Calcareous soils, Degradation, Groundwater pollution, Leaching, Plant uptake, Soil treatment.

2,4-Dinitrophenol (DNP) is a moderately weak acid that is expected to be highly labile (leachable and plant available) in high-pH soils. The adsorption and degradation behavior of DNP in two sludge-amended, calcareous soils was determined and used to explain DNP uptake by plants grown in the soils in the greenhouse. The DNP adsorption was minor in both soils and was only slightly affected by sludge. The DNP degradation was rapid in both soils and was unaffected by sludge. Thus, despite limited soil adsorption, plant uptake of DNP was minor in all crops and plant parts owing to rapid soil DNP degradation. Even if a municipal sludge highly contaminated with DNP was identified (an unlikely occurrence), concerns over possible plant contamination should not limit sludge application to calcareous soils at agronomic rates. Rapid degradation will minimize opportunities for plant uptake of DNP from contaminated soils or leaching of DNP to groundwater, given careful water management. (Author's abstract)

PLANT UPTAKE OF PENTACHLOROPHENOL FROM SLUDGE-AMENDED SOILS.
New Mexico State Univ., Las Cruces. Dept. of Agronomy and Horticulture.
G. A. Bellin, and G. A. O'Connor.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 598-602, July/September 1990. 1 fig, 1 tab, 21 ref. U.S. EPA Cooperative Agreement CR-812687-02.

Descriptors: *Bioaccumulation, *Fate of pollutants, *Organic compounds, *Path of pollutants, *Pentachlorophenol, *Plant uptake, *Sludge, *Sludge utilization, *Soil contamination, Alkaline soils, Crops, Degradation, Food chains, Radioisotopes, Soil treatment.

A greenhouse study was conducted to determine the effects of sludge on plant uptake of (C-14)-pentachlorophenol (PCP). Plants included tall fescue (Festuca arundinacea Schreb.), lettuce (Latuca sativa L.), carrot (Daucua carota L.), and chile pepper (Capsicum annum L.). Minimal intact PCP was detected in the fescue and lettuce by gas chromatography/mass spectrometry (GC/MS) analysis. No intact PCP was detected in carrot tissue extracts. Chile pepper was not analyzed for intact PCP because methylene chloride extracts contained minimal C-14. The GC/MS analysis of soil extracts at harvest suggested a half-life of PCP of about 10 d, independent of sludge rate or PCP loading rate. Rapid degradation of PCP in the soil apparently limited PCP availability to the plant. Bioconcentration factors (dry plant wt/initial soil PCP concentration) based on intact PCP were <0.01 for all crops, suggesting little PCP uptake. Thus, food chain crop PCP uptake in these alkaline soils should not limit land application of sludge. (Author's abstract)

SORPTION AND DEGRADATION OF PENTACHLOROPHENOL IN SLUDGE-AMENDED SOILS.
New Mexico State Univ., Las Cruces. Dept. of Agronomy and Horticulture.
C. A. Bellin, G. A. O'Connor, and Y. Jin.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 603-608, July/September 1990. 4 fig, 1 tab, 22 ref. U.S. EPA Cooperative Agreement CR-812687-02.

Descriptors: *Biodegradation, *Fate of pollutants, *Organic compounds, *Path of pollutants, *Pentachlorophenol, *Sludge, *Sludge utilization, *Soil contamination, Acidic soils, Alkaline soils, Degradation, Leaching, Radioisotopes, Soil treatment, Sorption.

Sorption and degradation of pentachlorophenol (PCP) by two alkaline and one acid soil was studied in the presence and absence of sewage sludge. The PCP concentrations used (0.1-10 mg/kg) included PCP rates expected with land application of normal municipal sewage sludges. Sorption/desorption isotherms, derived using batch equilibrium techniques, were described by the Freundlich equation. The PCP sorption increased with increasing sludge additions. Desorption in the alkaline soils was completely reversible and no irreversible residues were formed. Leaching of PCP would be most likely in the unamended alkaline soils. Degradation of PCP at low (0.75 mg/kg) initial concentration was rapid (half-life of 10-15 d) in alkaline soils, but much slower (half-life of approximately 38 d) in the acid soils. Sludge additions to the soils did not substantially affect PCP degradation. More rapid degradation of PCP in alkaline vs. acid soils was attributed to less sorption and more favorable conditions for microbial activity. Rapid degradation in the alkaline soil, and greater sorption in the acid soil, reduce the chance of PCP leaching. However, longer PCP residence times in the acid soil increase the possibility for plant uptake. (Author's abstract)

IDENTIFYING FLOW PATHS IN MODELS OF SURFACE WATER ACIDIFICATION.
Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
M. B. Beck, F. M. Kleissen, and H. S. Wheater.
Reviews of Geophysics RVGPB4, Vol. 28, No. 2, p 207-230, May 1990. 18 fig, 1 tab, 36 ref.

Descriptors: *Acid rain effects, *Acidic water, *Acidification, *Flow models, *Model studies, *Path of pollutants, *Surface water, Coefficients, Flow pattern, Glasgow, Mathematical models, On-site data collections, Scotland, Surface flow, Tracers, Uncertainty.

A clear identification of the movement of water through soils is of central importance to the characterization of surface water acidification. The problem of how a uniquely best set of values for the coefficients of simple models can be estimated from field observations, in particular, tracer observations was explored. Two external observation couples, precipitation/flow and concentrations of a conservative tracer, have been used in the conceptual modeling of the acidification of surface waters. A method for the analysis of model identifiability includes: (1) the postulation of a set of experimental field conditions with their associated assumptions of observation accuracy; (2) the postulation of a model and its associated uncertainties; and (3) the exploration of the identifiability of the model's constituent parameters (hypotheses). A (U.K.) Royal Society's Surface Water Acidification Programme field site situated 40 km north of Glasgow was the subject of an analysis of model uncertainty. For a one-store model, with no observations of the tracer, the proportionality constant, k(a), was relatively well identified when first events occurred after dry periods while the accuracy of the estimate progressively declined during wet periods. When observations of the tracer were included, k(a) was much better identified. For a two-store nonlinear model, tracer observations improved the identifiability of parameters, and the relative identifiability of the model parameters was analyzed. The skill in predicting future behavior in flow paths in a catchment will lie in locating the ambiguity in the model and making predictive statements that are minimally sensitive to it. (MacKeen-PTT)

Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 352-371, March 1990. 9 fig, 3 tab, 54 ref. NSF Grants DEB 81-07522 and BSR 83-16359.

Descriptors: *Amazon River, *Biochemistry, *Biogeochemistry, *Carbon cycle, *Dissolved organic carbon, *Geochemistry, *Nutrients, *Organic carbon, *Suspended sediments, Carbon dioxide, Chemical properties, Dissolved oxygen, Dissolved solids, Solute transport.

Depth-integrated, discharge-weighted water samples were collected over 1,800 km of the Amazon River on eight cruises at different stages of the hydrograph, 1982-1984. Fine (FPOC, < 63 microns) and coarse (CPOC, > 63 microns) particulate organic carbon as weight percentage of suspended sediment varied between 0.9-1.5% for FPOC and 0.5-3.4% for CPOC. Concentrations of FPOC ranged from 5 mg/liter upriver to 2 mg/liter downriver in the mainstem and from 6 mg/liter in the Rio Madeira to < 1 in the Rio Negro. CPOC had similar distribution patterns, but with concentrations 15-30% those of FPOC. Dissolved organic carbon (DOC) averaged 4-6 mg/liter in the mainstem and up to 12 mg/liter in the Rio Negro. Upriver dissolved inorganic carbon (DIC) concentrations of about 1,200 micromolar were diluted by tributaries and floodplain drainage to 600 micromolar at the most downriver site. Evasion of CO2, invasion of O2, and in situ oxidation were of comparable magnitude, 3-8 micromoles/square meter/s. The average export of total organic carbon (TOC) was 36.1 terragrams/yr (8.5 g/square meter/yr), of which 62% was DOC, 34% was FPOC, and 4% was CPOC. TOC inputs were insufficient to support in situ oxidation by a factor of at least two. A relatively small, rapidly cycling pool of labile organic matter may coexist with a much larger pool of more refractory material. (Author's abstract)

Archives of Environmental Health AEHLAU, Vol. 45, No. 3, p 175-179, 1 fig, 2 tab, 15 ref, May/June 1990.

Descriptors: *Chlorination, *Chloroform, *Public health, *Swimming pools, *Water treatment, Biochemistry, Gas chromatography, Italy, Modena, Recreation, Statistical analysis.

The chloroform content of swimmers and visitors who were exposed to chloroform (CHCl3) at three indoor swimming pools in Modena, Italy were evaluated. Chloroform was measured in plasma samples of 127 subjects present at the pools and in 40 nonexposed subjects. The analyses were performed by head-space gas chromatography. Chloroform was present in all samples collected from the 127 subjects who attended the pools (median = 7.5 nmol/L; range = 0.8-25.1 nmol/L. Swimmers who trained for competitions showed a significantly higher mean value of plasma CHCl3 than nonagonistic swimmers and visitors. Plasma CHCl3 levels were significantly correlated with: (1) CHCl3 concentrations in water and in environmental air; (2) the number of swimmers in the pools, and; (3) the time spent swimming. Covariance analysis showed that plasma CHCl3 levels also depended on the intensity of the sport activity (total explained variance = 67.4%). (Author's abstract)

INVESTIGATION OF THE METAL-ALGAE BINDING SITE WITH 113-CD NUCLEAR MAGNETIC RESONANCE.
Texas Univ. at Austin. Dept. of Chemistry.
V. Majidi, D. A. Laude, and J. A. Holcombe.
Environmental Science and Technology ESTHAG, Vol. 24, No. 9, p 1309-1312, September 1990. 4 fig, 15 ref.

Descriptors: *Algae, *Bioaccumulation, *Cadmium, *Fate of pollutants, *Heavy metals, *Nuclear magnetic resonance, *Path of pollutants, Biochemistry, Cadmium radioisotopes, Cobalt, Copper, Hydrogen ion concentration, Iron, Sodium.

Metal-algae interactions in a unialgal culture (Stichococcus bacillaris) were examined with 113-Cd nuclear magnetic resonance (NMR) spectroscopy. In addition to a peak which was attributed to cadmium in solution, a second broad resonance was assigned to cadmium binding with the algal cell wall. Studies of competitive uptake with other metals permit an affinity ranking assigned as Cu, Fe, > Cd, Co, and Na. pH studies indicate that although the presence of protons in the solution does not chemically alter the nature of the binding sites, the excess protons will directly replace the bound Cd. An NMR chemical shift of -10 to -18 ppm for the bound cadmium indicates the functional group responsible for metal uptake is most likely a carboxylic group. The chemical shift of the resonance also suggests the carboxyl groups involved in metal adsorption may possess larger chain lengths and perhaps multiple carboxyl groups per chain. (Author's abstract)

Environmental Science and Technology ESTHAG, Vol. 24, No. 9, p 1367-1372, September 1990. 2 fig, 3 tab, 41 ref.

Descriptors: *Acid rain effects, *Acidic lakes, *Bioaccumulation, *Cadmium, *Limnology, *Precambrian Shield Lakes, *Zooplankton, Canada, Crustaceans, Fate of pollutants, Lakes, Ontario, Organic carbon, Path of pollutants, Phosphorus, Plastic Lake, Seasonal variation, Temporal variation.

The cadmium in Epilimnetic zooplankton collected from 33 nonacidified, south central Ontario lakes, most of which were remote from local point sources of Cd emissions, ranged in concentration from 0.16 to 29.8 micro grams/gram of dry weight. Levels were positively correlated with aqueous Cd concentrations and negatively correlated with lake water Ca, organic carbon, and total phosphorous concentrations. A stepwise regression model developed for these lakes overestimated Cd concentrations in zooplankton from acidic (pH <5), clear water lakes, presumably because the acidity of these lakes depressed Cd uptake. Cd levels varied by 5 fold over the ice-free season in plastic lake, an acidifying lake in south central Ontario. While Cd levels were not correlated with zooplankton composition in the lake survey, temporal variations in Cd levels in Plastic Lake were attributed, in part, to seasonal and annual changes in zooplankton community structure in the lake. OCCURRENCE, DISTRIBUTIONS, AND TRANSPORT OF HERBICIDES AND THEIR DEGRADATION PRODUCTS IN THE LOWER MISSISSIPPI RIVER AND ITS TRIBUTARIES.
Geological Survey, Denver, CO.
W. E. Pereira, and C. E. Rostad.
Environmental Science and Technology ESTHAG, Vol. 24, No. 9, p 1400-1406, September 1990. 5 fig, 3 tab, 16 ref.

Descriptors: *Herbicides, *Mississippi River, *Path of pollutants, Agricultural runoff, Alachlor, Atrazine, Chemical analysis, Chlorinated hydrocarbons, Chloroacetanalide, Cyanazine, Gulf of Mexico, Metolachlor, Pollution load, Simazine, Triazines.

The Mississippi River and its tributaries drain extensive agricultural regions of the mid-continental US where large amounts of herbicides are applied as weed control agents on crops such as corn and soybeans. Studies being conducted by the US Geological Survey (USGS) along the lower Mississippi River and its major tributaries, representing a 1930-km river reach, have confirmed that several triazine and chloroacetanalide herbicides and their degradation products are present in this riverine system. These herbicides include atrazine, and its degradation products, desethl-, and desisopropylatrazine; cyanazine; simazine; metolachlor; and alachlor and its degradation products, 2-chloro-2',6'-diethylacetanalide, and 2-hydroxy-2',6'-diethylacetanilide. Loads of these compounds were determined at 17 different sampling stations under various seasonal and hydrologic conditions, during five sampling trips from July 1987 to June 1989. Stream loads of herbicides were relatively small during the drought of 1987 and 1988. Stream loads were much greater during the relatively wet year of 1989. Trace levels of atrazine, cyanazine, and metolachlor also were associated with suspended sediments. Distribution coefficients of these compounds varied considerably between sites and were much larger than values reported in the literature. The annual transport of atrazine into the Gulf of Mexico was estimated to be less than 2% of the amount of atrazine applied each year in the mid-west. (Author's abstract)

Descriptors: *Cleanup operations, *Environmental effects, *Incineration, *Oil pollution, *Polycyclic aromatic hydrocarbons, *Water pollution sources, *Water pollution treatment, Air pollution, Chemical analysis, In situ treatment, Organic carbon

An investigation was conducted concerning some of the factors necessary to assess the environmental impact of an in situ burn: the fraction of an oil layer that can be burned, the quantity of smoke, and the concentrations of 18 polycyclic aromatic hydrocarbons (PAHs) in the smoke, crude oil, and burn residue. Alberta Sweet crude in 2-, 3-, 5, 10, and 30-mm layers on water was burned and smoke samples were collected at elevated and ambient temperatures and analyzed by two independent laboratories. While burning the crude oil produced less total PAHs than were in the original crude oil, the concentrations of PAHs with five or more rings were 10 to 20 times greater in the smoke than in the oil. The organic carbon fraction of the smoke was in the range of 14-21%. As the fuel layer thickness was increased from 2 to 10mm, the smoke yield increased from 0.035 to 0.080 g of smoke/g of fuel, and the percentage of oil residue decreased from 46 to 17%. By consuming much of the oil spill and reducing the amount of PAHs in the water, and by dispersing the combustion products over a larger area, in situ burning can migrate the local environmental impact of an oil spill. There appears to be a range of conditions, such as in Arctic ice fields, where in situ burning might be the most viable cleanup method. (Author's abstract)

CHEMICAL AND PHYSICAL SPECIATION OF TRACE METALS IN FINE GRAINED OVERBANK FLOOD SEDIMENTS IN THE TYNE BASIN, NORTH-EAST ENGLAND.
Newcastle upon Tyne Univ. (England). Dept. of Geography.
M. G. Macklin, and R. B. Dowsett.
Catena, Vol. 16, No. 4/5, p 135-151, August/October 1989. 8 fig, 1 tab, 24 ref.

Descriptors: *Chemical speciation, *England, *Flood plain sediments, *Heavy metals, *Path of pollutants, *Sedimentation, *Speciation, *Trace metals, Contamination, Metal complexes, Tyne Basin, Water pollution.

Deposition of fine sediment contaminated by heavy metals on floodplains in the Tyne Basin, north-east England, during a major flood in August 1986 provided an unusual opportunity to investigate the physical and chemical speciation of metals in overbank fines. Selective extractions and heavy-liquid analyses were used to assess the chemical forms of sediment-associated metal and the relationship between grain size, density and metal concentration and to identify sources of metalliferous material. Generally the highest concentrations of trace metals were found in the 500-250 microm size range and in the heavier density fractions (> 3.3 g/ml), though more than 60% of metals reported to the lightest (< 3.3 g/ml) density product. THe principal source of metals appeared to be reworked alluvium contaminated by historic mining activity. Metals concentrations in flood sediment decrease downstream from former mining areas at varying rates depending on the physical properties and chemical phase of individual metals. With the exception of copper (dominated by lithogenic fraction), metals are primarily associated with iron/manganese oxides (lead, zinc) and to a lesser extent with carbonates (cadmium, zinc), organic matter (zinc, copper) and an operationally defined exchangeable cadmium component. In the upper and middle parts of the Tyne basin physical processes of downstream sediment metal content reduction were found to predominate, while in the lower reaches of the Tyne sediment, metal transport appears to be governed by chemical sorption-desorption processes associated with iron/manganese oxides and organic material. Before employing sediment-density based dispersal models to predict downstream metal concentrations, grain size and density fractions must be ascertained for the majority of sediment-associated metals, and their chemical form as revealed by selective extraction techniques. HEAVY METAL DISTRIBUTION IN SEDIMENTS OF KRISHNA RIVER BASIN, INDIA.
McGill Univ., Montreal (Quebec). Dept. of Geological Science.
R. Ramesh, V. Subranian, and R. Van Grieken.
Environmental Geology and Water Sciences EGWSEI, Vol. 15, No. 3, p 207-216, May/June 1990. 5 fig, 6 tab, 30 ref.

Descriptors: *Heavy metals, *India, *Krishna River, *Path of pollutants, *Suspended sediments, Topography, Trace metals, Water pollution, X-ray fluorescence.

Suspended and bed sediments collected from the entire region of the Krishna River and its major tributaries were analyzed for heavy metals (vanadium, chromium, manganese, iron, cobalt, nickel, copper, zinc, and lead) by the thin-film energy dispersive x-ray fluorescence technique. There is considerable variation in the concentration of elements proceeding downstream, which may be due to the variation in the subbasin geology and various degrees of human impact. Suspended particles have high concentrations of heavy metals throughout the basin bed sediments. The heavy metals are highest in coarse size fractions (10 to 90 microm) throughout the Krishna River except for the Bhima tributary where finer fractions (2 microm) dominate. Transition elements correlate very well with each other. There is a striking similarity between the bed sediments of Krishna River and the average for Indian rivers. When the annual heavy metal flux carried by the Krishna River was estimated, and viewed in relation to the other major riverine transport, the Krishna appears to be a minor contributor of heavy metals to the Bay of Bengal. PHOSPHORUS IN WATERS FROM SEWAGE SLUDGE AMENDED LYSIMETERS.
Illinois Univ., Urbana. Dept. of Agronomy.
T. D. Hinesly, and R. L. Jones.
Environmental Pollution ENPOEK, Vol. 65, No. 4, p 293-309, 1990. 6 tab, 17 ref.

Descriptors: *Lysimeters, *Path of pollutants, *Phosphorus, *Sludge utilization, *Soil amendments, *Soil-water-plant relationships, Aluminum, Corn, Eutrophication, Fertilizers, Iron, Runoff, Tile drainage.

In surface waters, phosphorus (P) concentrations exceeding 0.05 mg/L may cause eutrophic conditions. Total P concentrations were measured in runoff and tile drainage waters from land receiving either inorganic fertilizer or anaerobically digested sewage sludge during two years of sample collections from instrumented, large-scale lysimeters planted to corn (Zea mays). During the three years prior to monitoring P concentrations, six of the lysimeter plots had been amended with anaerobically digested sewage sludge which supplied 5033 kg P per ha. Additional sludge applications supplied 1058 and 1989 kg P per ha during the first and second years of monitoring operations. Another six lysimeters were annually treated with fertilizer which included P applications amounting to 112 kg per ha. For years 1 and 2, annual losses from lysimeters treated with sewage sludge were 4.27 and 0.35 kg P per ha in runoff and 0.91 and 0.51 kg P per ha in drainage waters. Parallel annual losses of P from lysimeters treated with superphosphate were 2.15 and 0.17 kg P per ha in runoff and 0.53 and 0.35 kg P per ha in tile drainage waters. Sludge applications did not significantly change absolute soil contents of organic P, but did decrease the percent of total P present in organic forms. Sludge and soil contained 21% and 36% of their total P contents in organic forms. In sludge and soil about 85% and 64% of their respective total inorganic P contents were associated with the Al and Fe fractions. Sludge applications significantly increased soil contents of P in the saloid aluminum, iron and reductant soluble P fractions, but contents of calcium-bound P were not changed. Total P contents of the soil below a depth of 30 cm were not affected by sludge incorporated to a depth of about 15 cm by plowing. (Author's abstract)

Descriptors: *Acid rain, *Acid rain effects, *Denitrification, *Lake acidification, *Limnology, *Nitric acid, *Sulfuric acid, Algal uptake, Sediment-water interfaces.

The acidification efficiencies of nitric and sulfuric acids were compared for 5 yr by separate experimental additions of the acids to the partitioned north and south basins of Lake 302. In the epilimnion, nitric acid was 70% as efficient as sulfuric acid in reducing alkalinity. On a whole-lake basis, acidification by nitric acid was about half as efficient as by sulfuric acid. In-lake processes removed 70 and 57% of the added nitric and sulfuric acids. Before acidification, algal uptake and sediment sulfate uptake were of about equal importance in terms of in-lake sulfate removal. Nitrate was primarily removed by algal uptake and sedimentation. After acidification, algal uptake of nitrate and sulfate did not change, but rates of uptake in the sediments by bacterial processes increased and dominated in-lake removal. Nitric acid acidified the north basin because the acid additions exceeded the capacity of all biological removal processes. Algal uptake and sedimentation of nitrogen could

not increase in proportion to increases in nitrate because of P limitation. Sediment-denitrification rates increased tremendously (about 40-fold) but only removed a portion of the incoming nitrate because denitrification was limited by the rate of transport to the sediment-water interface. MIXING IN OVERLAND FLOW DURING RAINFALL.
Missouri Univ.-Columbia. Dept. of Civil Engineering.
R. L. Peyton, and T. G. Sanders.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 764-784, July/August 1990. 11 fig, 1 tab, 27 ref.

Descriptors: *Mathematical models, *Mixing, *Model studies, *Nonpoint pollution sources, *Overland flow, *Path of pollutants, *Rainfall-runoff relationships, *Water pollution sources, Convection, Data interpretation, Rainfall, Reynolds number, Turbulent flow.

Vertical mixing coefficients in overland flow is estimated with rainfall using laboratory data and a mathematical model of shear-flow convection, rainfall dilution and vertical mixing. The laboratory data consist of concentration-time measurements downstream from an injection of a conservative dye. The dye was injected into overland flow (during rainfall) over a smooth impervious surface with constant slope and without sediment. The flow is in the laminar Reynolds number range. Results of the mathematical model were compared to the concentration-time measurements to calibrate values of the vertical mixing coefficient. The calibrated values of the vertical mixing coefficient are most highly correlated to the slope and a Reynolds number related to rainfall intensity. An analysis of the calibrated vertical mixing coefficient values using equations for eddy turbulence did not prove satisfactory. (Author's abstract)

MERCURY CONTENT OF SWORDFISH, XIPHIAS GLADIUS, IN RELATION TO LENGTH, WEIGHT, AGE, AND SEX.
Universidade dos Acores, Horta (Portugal). Dept. de Oceanografia e Pescas.
L. R. Monteiro, and H. D. Lopes.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 293-296, June 1990. 4 fig, 3 tab, 28 ref.

Descriptors: *Bioaccumulation, *Bioindicators, *Mercury, *Swordfish, Heavy metals, Marine pollution, Water quality.

Levels of total mercury were determined in the white muscle tissue of swordfish, Xiphias gladius L., caught in the Azores, ranging in weight from 0.06 to 4.91 microgm/g. Mercury concentrations were studied in relation to length, weight, age and sex and significant sex-based differences were found. The rate of mercury accumulation in males is significantly faster than in females, and for medium-large sized fish, mean mercury levels were higher in males. The mean mercury level in males was 1.3 microgm Hg/g and 0.93 microgm Hg/g for females. Possible explanations involve the consideration of specific mechanisms of mercury elimination in females due to a different chemistry of gonad and gamete affecting the affinity of mercury and loss of residues in the sex products. Or, to a simple difference in the total amount of sperm and ova shed. Swordfish were shown to have a concentration factor of 300 compared to plankton. (King-PTT)

TISSUE DISTRIBUTION OF HEAVY METALS IN SMALL CETACEANS FROM THE SOUTHWESTERN ATLANTIC OCEAN.
Instituto Nacional de Investigacion y Desarrollo Pesquero, Mar del Plata (Argentina).
J. E. Marcovecchio, V. J. Moreno, R. O. Bastida, M. S. Gerpe, and D. H. Rodriguez.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 299-304, June 1990. 2 fig, 4 tab, 32 ref.

Descriptors: *Bioaccumulation, *Heavy metals, *Marine mammals, *Marine pollution, *Path of pollutants, Bioindicators, Bottlenose dolphins, Cetaceans, Copper, Ecosystems, Fate of pollutants, Mammals, Mercury, Pollutant identification, Tissue analysis, Whales, Zinc.

Tissue distribution of heavy metals, total mercury, cadmium, zinc, and copper, in specimens of Bottlenose Dolphin (Tursiops gephyreus), Franciscana Dolphin (Pontoporia blainvillei), and Pigmy Sperm Whale (Kogia breviceps) stranded on SW Atlantic beaches were studied by atomic absorption spectrophotometry. The liver was the most important site for the accumulation of Hg, Zn, and Cu in the specimens studied while the kidney was most important for Cd accumulation. Mercury contamination in Tursiop gephyreus increased with age, and therefore, correlated with its ichyophagus habits. The Franciscana had lower mercury levels than the bottlenose because of their younger ages and a diet which is heavier in squid and crustaceans. Also, mercury levels were higher in the muscle tissues of Franciscana than in their livers. The Franciscana can stay in very saline waters and their ability to maintain a salt balance may help to detoxify their livers. Maximum mercury concentrations in the pigmy sperm whales was 11.74 ppm, well below the level found in the Bottlenose Dolphin. The sperm whales were adults so this lower Hg level was probably the result of their diet of squid. The highest Cd, Zn and Cu levels were found in the kidneys of all three species. (King-PTT)

MERCURY NEAR A CAUSTIC SODA PLANT AT KARWAR, INDIA.
Central Marine Fisheries Research Inst., Cochin (India).
P. K. Krishnakumar, and V. K. Pillai.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 304-307, June 1990. 2 fig, 2 tab, 13 ref.

Descriptors: *India, *Karwar, *Marine pollution, *Mercury, *Path of pollutants, Arabian Sea, Atomic absorption spectrophotometry, Bioaccumulation, Chlorine, Heavy metals, Mackerel, Marine sediments, Pollutant identification, Sodium hydroxide, Water pollution sources, Water quality.

Every year 180 tons of mercury are added to the Indian environment, of which 160 tons comes from 38 caustic soda plants including 23 units which electrolyze sea water. A caustic soda plant has been in operation south of Karwar, India since 1975. This plant discharges into the Binage Bay, known for its mackerel fishery. In February 1989, samples of surface water and bottom water were taken from four stations near the discharge point of the caustic soda plant. Surface sediment samples were collected from 10 stations from September 1987 to May 1988. Samples of mussels, oyster and seaweed were taken from 12 stations along the Karwar coast from September 1987 to February 1989. Fish, prawn, crab, and squid samples were taken from commercial landings in Karwar. Mercury was determined by cold vapor atomic absorption spectrophotometry. The mercury concentration in the vicinity of the discharge was 0.91 microgm/g to 2.62 microgr/g compared to the 0.061 microgm/g average concentration in the Arabian Sea. Levels were higher for surface water than bottom water. Mercury levels were highest in oysters and second highest in mussels, seaweed, and in order of declining concentration mackerel, prawn, crab, squid, and sardine. (King-PTT)

Complex and dynamic interactions are known to occur between organic micropollutants, solid phases, and dispersed polymer subphases present in natural waters. In this study, a triphase distribution model was used in conjuction with experimental analyses to characterize the effects of humic polymers dispersed in an aqueous phase on the sorption of hydrophobic organic compounds from that phase by natural solids. The results indicate that the sorption of moderately hydrophobic compounds by lacustrine sediments is relatively unaffected by the presence of humic polymers, whereas the sorption of highly insoluble organic contaminants by the same sorbents is sensitive to small amounts of background organic polymers. These data support the reports of others regarding the extent of the impact of organic subphases on the fate and transport of pollutants in natural aquatic systems. (D'Agostino-PTT)

GEOCHRONOLOGY FOR POLYCYCLIC AROMATIC HYDROCARBON CONTAMINATION IN SEDIMENTS OF THE SAGUENAY FJORD.
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Dept. of Fisheries and Oceans.
J. N. Smith, and E. M. Levy.
Environmental Science and Technology ESTHAG, Vol. 24, No. 6, p 874-879, June 1990. 7 fig, 20 ref.

Descriptors: *Aluminum, *Path of pollutants, *Polycyclic aromatic hydrocarbons, *Sediment contamination, *Sediment distribution, Carcinogens, Estuarine sediments, Fluvial sediments, Quebec, Scavenging.

Of the wide range of environmental organic contaminants, polycyclic hydrocarbons (PAHs) are of particular concern due to their potential or proven carcinogenicity. After entering the environment, mainly by the combustion of organic materials, they are widely disseminated by fluvial and aeolian pathways and eventually accumulate in soils and sediments. Combined atmospheric/fluvial transport and deposition data indicate that the PAH concentrations and sediment fluxes of the Saguenay Fjord, Quebec, are directly accounted for by concurrent developments in the region's aluminum industry. In addition, the linear relationship observed between PAH and organic matter concentrations suggests that scavenging from the water column may be the dominant mechanism for PAH deposition. CONTAMINATION OF BAVARIAN LAKES AFTER THE CHERNOBYL REACTOR ACCIDENT: A TWO-COMPARTMENT MODEL ANALYSIS.
Bayerische Landesanstalt fuer Wasserforschung, Munich (Germany, F.R.).
W. Sanger, and K. Hubel.
Health Physics HLTPAO, Vol. 58, No. 5, p 649-653, May 1990. 4 fig, 2 tab, 6 ref. Research project St.Sch.1.071, German Federal Ministry of the Environment.

Descriptors: *Chernobyl, *Mathematical models, *Nuclear accidents, *Nuclear reactors, *Path of pollutants, *Radioecology, Gamma radiation, Lakes, Surface water, Contamination.

Almost immediately following the reactor incident in Chernobyl in 1986, the short-lived radionuclides 103Ru, 131I, and 132Te, along with the longer-lived nuclides 134Cs and 137Cs were washed out by rainfall into the South Bavarian lakes. Shortly after, the Bavarian Agency for Water Research assessed the contamination by spectral measurement of the gamma radiation in unfiltered lake water surface samples. For all lakes and radionuclides examined, decomposition analysis using a mathematical two-compartment model indicated that the activity concentration changed from a rapid decrease, from initially high values, to an approximately 10 times slower decrease in a time-dependent manner. These data demonstrate a time-dependent dispersion of contaminating radionuclides in surface waters. (D'Agostino-PTT)

ASSOCIATION OF SHOWER USE WITH LEGIONNAIRES' DISEASE.
Center for Infectious Diseases, Atlanta, GA. Div. of Bacterial Diseases.
R. F. Breiman, B. S. Fields, G. N. Sanden, L. Volmer, and A. Meier.
JAMA: Journal of the American Medical Association JAMAAP, Vol. 263, No. 21, p 2924-2926, June 1990. 3 tab, 25 ref.

Descriptors: *Aerosols, *Amebas, *Bathing, *Human diseases, *Legionella, Bacterial analysis, Epidemiology, Potable water, Water analysis.

Prevention of Legionnaires' Disease (LD) has so far been limited due to a lack of understanding of the ecology of the causative agent, Legionella pneumophila. In a lengthy outbreak of nosocomial LD at a South Dakota hospital both the epidemiologic and laboratory data implicated the aerosolized shower water as the vehicle for disease transmission. In addition, the presence of amoebae at the implicated potable water sites correlated directly with the presence of the epidemic strain of Legionella pneuophilia. The combined evidence suggests that the amoebae serve as resevoirs and provide the bacteria with an intracellular environment for multiplication. Recognition of this interrelationship between amoebae and L. pneumophilia may lead to new disinfection methods and subsequent disease prevention. (D'Agostino-PTT)

FREQUENCY ANALYSIS OF TRACE LEVEL WATER QUALITY DATA WITH A TIME VARYING CENSORING LEVEL.
Merrick and Co., Denver, CO.
S. R. Durrans.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 92-101, 1 fig, 7 ref.

Descriptors: *Frequency analysis, *Statistical analysis, *Trace levels, *Urban hydrology, *Urban runoff, *Water quality, Data interpretation, Pollutant identification, Regression analysis, Statistical methods.

Databases representing measurements of trace level contaminant concentrations are often censored by a constraint on the range over which measurements can be made. Technology is such that there is often a detection limit below which contaminant concentrations can not be measured and as a result, databases can be proliferated with entries such as 'undectable' or 'less than detection limit'. A number of recent studies have addressed the frequency analysis of censored data sets but have all been limited to the special case where the detection limit is constant over time. Statistical methods such as regression techniques and the method of maximum likelihood are intended to be applied to the lognormal distribution, but may also be applied to the normal distribution. The implications of the comparison between these two methods appears to be significant. The regression approach, because of its relative simplicity, is probably the most frequently applied of the two estimation techniques. This method has previously been shown to be comparable to the maximum likelihood technique and its use has thus been justified. A qualitifaction must now be imposed on the statement of comparability however. Previous studies have all addressed the special case of a time invariant censoring level rather than the more general situation presented here. While the regression technique might perform well in the special case, it fails in the general case since not even all of the non-censored data values can be utilized. The method of maximum likelihood, on the other hand, makes use of all observed data, including that which is censored, and thus serves to maximize the benefit that is afforded by a reduced censoring level. USE OF A COMPARTMENTAL MODEL TO DEVELOP RULES FOR THE INTERPRETATION OF WATER QUALITY DATA.
Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
J. P. Lumbers, and S. J. Wishart.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 147-158, 8 fig, 19 ref.

Descriptors: *Ammonia, *Data interpretation, *Expert systems, *Fish physiology, *Mathematical models, *Model studies, *Path of pollutants, *Toxicity, Fisheries, Performance evaluation, Water pollution prevention, Water quality.

A mathematical model was used to investigate the toxicity of fluctuating ammonia concentrations to freshwater fish. The effects of varying ammonia concentrations over time were integrated in a compartmental model designed to simulate the uptake and depuration of ammonia and its transport within the organism to a critical site. Adjustment of parameter values to allow for acclimation and other modifying factors was examined. The performance of the model was compared with published LC50-exposure curves and experimental evidence of the response of fish to varying ammonia concentrations. An immediate difficulty in the use of the compartmental model was a lack of direct observations of ammonia concentration in blood plasma and intracellular fluid which may be used to estimate the values of the rate constants incorporated in the model. Results are presented for the simulated response to synthetic time-series of ammonia in the environment. These results may be used for the control of fluctuating pollutant concentrations in response to water quality standards. The model may be used to derive permissible magnitude-duration-frequency combinations for pollution events. The compartment model could be used within an expert system during each interpretation or outside the expert system to derive rules to be written into the knowledge base. CYANOBACTERIAL TOXINS IN EUROPEAN WATERS: OCCURRENCE, PROPERTIES, PROBLEMS AND REQUIREMENTS.
Dundee Univ. (Scotland). Dept. of Biological Sciences.
G. A. Codd, W. P. Brooks, L. A. Lawton, and K. A. Beattie.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 211-220, 4 tab, 54 ref.

Descriptors: *Algal blooms, *Cyanophyta, *Eutrophication, *Path of pollutants, *Phosphorus removal, *Toxins, Aquatic bacteria, Europe, Monitoring, Pollutant identification, Water quality standards.

The cyanobacteria (blue-green algae) which commonly occur as massive growths in nutrient-enriched European freshwaters typically belong to groups which can produce toxins. Toxic cyanobacteria have long been recognized as causative agents of animal, bird and fish kills and evidence exists for their adverse effects on human health. Cyanobacterial toxins also have adverse effects on zooplankton and can be accumulated by shellfish. Toxic cyanobacterial blooms have been recorded from at least 16 European countries and their toxins have been detected in over 50% of the samples collected (>200) in Europe. Toxin-forming genera include Microcystis, Anabaena, Anabaenopsis, Aphanizomenon, Oscillatoria, Nodularia, Gloeotrichia, Coelosphaerium, Gomphosphaeria, Lyngbya, Schizothrix, Cylindrospermopsis, and Nostoc. The toxins include hepatotoxic cyclic 7-and 5-amino acid peptides, neurotoxic alkaloids, phenolics, lipopolysaccharides and others as yet uncharacterized. Cyanobacterial toxin detection and quantification has relied upon mouse bioassays until recently although chromatographic-, cytotoxicity-, and immunoassays are now available. Cyanobacterial toxin production has been successfully regulated by reducing phosphorus inputs to water sources. Monitoring of bacterial scums for cyanobacterial toxins should be done in a timely manner as scums may appear and disappear quite rapidly. Water columns should also be sampled due to the ability of cyanobacteria to stratify in a water source. The widespread occurrence of toxic cyanobacteria in eutrophic European freshwaters and the hazard which they pose to human health indicate the need for guidelines for freshwater containing these toxins and standards if such sources are for drinking. CONTAMINATION OF POTABLE WATER BY CORROSION OF TIN-LEAD SOLDERED JOINTS.
Surrey Univ., Guildford (England). Dept. of Materials Science and Engineering.
R. Walker, and R. J. Oliphant.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 221-228, 1 fig, 6 tab, 17 ref.

Descriptors: *Corrosion, *Lead, *Potable water, *Public health, *Tin, *Water conveyance, *Water pollution effects, Chlorides, Drinking water, England, Hydrogen ion concentration, Pipes, Silicates, Sulfates, Water pollution prevention, Zinc.

A survey of houses in Great Britain in 1977 found that 9% of homes had a lead content in domestic water in excess of 0.1 mg/L and 20% over 0.05 mg/L in the first draw sample of water remaining in pipes overnight. This compares unfavorably with the report of the Commission of European Communities which in 1980 gave a level of lead of 0.05 mg/L for a sample of running water as the maximum admissible concentration with the rider that where samples either frequently or to an appreciable extent exceed 0.1 mg/L, suitable measures must be taken to reduce the exposure to lead on the part of the consumer. This concentration of lead in water can arise from the corrosion of tin-lead solders in copper water pipes. A galvanic corrosion cell was designed and used to quantitatively assess the effects of various water quality parameters on corrosion rates of the solder. The main features stimulating corrosion were found to be low pH (high acidity) and high concentration of chloride. Fortunately the presence of sulfate, silicate and zinc were shown to inhibit corrosion; the zinc originated from the zinc chlorides used as an active ingredient in the flux used in soldering. Carbonate hardness and orthophosphate had no effect on the corrosion rate. Only by limiting the area of solder exposed in the bore of the tube could a significant long-term problem be avoided. The only sure way to avoid contamination is to specify lead-free solders. (See also W91-01211) (Author's abstract)

CONSTRAINTS ON THE USE OF MODELS TO PREDICT THE MOVEMENT OF PESTICIDES TO GROUNDWATER.
R. J. Hance, and J. A. Guth.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 229-237, 33 ref.

Descriptors: *Error analysis, *Groundwater pollution, *Mathematical models, *Nonpoint pollution sources, *Path of pollutants, *Pesticides, *Water pollution sources, Adsorption, Herbicides, Pesticide kinetics, Prediction, Sampling.

Movement of a pesticide from soil to groundwater is affected by the properties of the chemical, the way in which it is used, the hydraulic properties of the soil and the hydrogeology of the region. These factors interact so they must all be considered if a realistic prediction is to be obtained. Currently available models for predicting groundwater contamination by pesticides involve simplifications of many, if not all, of the processes which are involved and often ignore some factors altogether. This is partly because of the complexity of the systems and partly because of a lack of appropriate data. Variability in the reported properties of pesticides, together with problems in measuring low concentrations and in sampling, make it difficult to validate models in the field so they are of limited value for predicting pesticide behavior. VIROLOGICAL QUALITY OF BATHING WATERS IN ENGLAND.
Severn-Trent Labs., Coventry (England).
R. Morris, and I. Cox.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 337-343, 3 fig, 3 tab, 18 ref.

Descriptors: *England, *Enteroviruses, *Swimming, *Water quality, *Water quality standards, Bacteria, Beaches, Coliforms, Pollutant identification, Recreation, Viruses, Water analysis, Water quality control.

The European Community (EC) bathing water directive includes a recommendation that waters at EC-designated bathing areas should be examined for the presence of enteroviruses whenever there are grounds for suspecting a deterioration in quality. In the United Kingdom this has been interpreted as being a response to the failure of bathing waters to satisfy the bacteriological requirements of the directive. The current U.K. practice is to examine two samples for enteroviruses in the recognized bathing season (May to September) when the water has failed bacteriologically in the previous year. In addition, the U.K. interpretation of the directive applies only to marine waters and, at this time, does not include any inland waters. In an examination of the virological data made available by many of the U.K. water authorities, the bodies currently responsible for bathing water quality, 48% of locations tested for the presence of enteroviruses in 1988 satisfied the requirements of the directive. However, of those failing to meet the enterovirus standard, 41% failed on only one sampling occasion while the remainder (11%) failed on at least two occasions. The highest level of enterovirus contamination detected was 206 plaque-forming units in a 10 liter sample. (See also W91-01211) (Author's abstract)

INCIDENCE OF ENTEROVIRUSES AROUND THE WELSH COAST: A THREE YEAR INTENSIVE SURVEY.
Welsh Water Authority, Bridgend.
H. Merrett, C. Pattinson, C. Stackhouse, and S. Cameron.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 345-351, 2 fig, 2 tab, 23 ref.

Descriptors: *Bioindicators, *Coliforms, *Enteroviruses, *Viruses, *Wales, *Water quality, *Water quality standards, Beaches, Monitoring, Pollutant identification, Public health, Recreation, Swimming, Water analysis, Water pollution sources, Water quality control.

The incidence of enteroviruses in 48 bathing waters around the Welsh coast was assessed during the period 1986-1988 as part of the routine compliance monitoring programme for European Community bathing waters. Out of a total of 623 samples taken, 168 (27%) were positive for enteroviruses and the number of virus particles in the samples ranged from 1-23 plaque-forming units/10 L water. Generally, the incidence of viruses in bathing waters adjacent to areas of high population density was higher than that in bathing waters far removed from these areas. However, viruses were also isolated from waters with no significant sewage input and where contamination by sewage material as estimated by the Escherichia coli/total coliform count was minimal. There was no correlation between the presence of enteroviruses and the presence of coliform organisms. Forty-six percent of samples which complied with mandatory E. coli/coliform standards did not comply with the enterovirus standard. (See also W91-01211) (Author's abstract)
W91-01236

MICROBIOLOGICAL QUALITY OF AN INLAND SURFACE WATER USED FOR RECREATIONAL PURPOSES.
Severn-Trent Labs., Coventry (England).
R. Morris.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 353-356, 2 tab, 11 ref.

Descriptors: *Coliforms, *Surface water, *Swimming, *Viruses, *Water pollution effects, *Water quality, *Water quality standards, Bacteria, Microbiological studies, Monitoring, Pollutant identification, Public health, Recreation, Rivers, Water quality control.

During 1987 an inland surface water was monitored to determine its microbiological quality. The water is extensively used for recreational purposes with users frequently experiencing total immersion. The findings are evaluated against the European Community directive for bathing water quality, the only standard against which the health risk associated with a recreational water can be assessed at the present time. The water failed to meet the mandatory standard set for total coliforms (<10,000 per 100 ml) on all but one occasion of 23 samplings. Similarly, the standard of <2,000 fecal coliforms/100 ml was satisfied on three occasions while the guideline value of <100 fecal streptococci/100 ml was met by eight samples. Virologically, the water failed to meet the standard of nil detectable viruses in a 10 liters sample on 20 of 24 occasions. The users of the water regularly complain of gastroenteritis and it is obvious from the microbiological data that it is inadvisable to use the surface water for recreational purposes. This is particularly important where total immersion can be a feature of the recreational activity. (See also W91-01211) (Author's abstract)

FATE OF GENETICALLY ENGINEERED MICROORGANISMS IN FRESHWATER.
Freshwater Biological Association, Ambleside (England).
R. W. Pickup, J. R. Saunders, J. A. W. Morgan, C. Winstanley, and J. G. Jones.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 375-380, 3 fig, 1 tab, 12 ref.

Descriptors: *Enterobacter, *Fate of pollutants, *Genetic engineering, *Genetic pollution, *Pseudomonas, Amino acids, Bioindicators, DNA, Escherichia coli, Serratia, Water pollution effects.

The survival of several members of the genera Pseudomonas and Enterobacteriaceae was monitored in sterile freshwater microcosms. The test organisms were able to survive and maintain a concentration of 1,000-100,000 cells/ml over periods exceeding 60 days. However, their ability to retain the plasmid associated phenotype (xylE) showed both intergeneric and intrageneric differences. Only the auxotrophic test organisms in the absence of vital amino acids declined rapidly once released into the microcosms and became undetectable after 30 days. These results indicate that, while it may be possible to predict the survival of the bacterial host in sterile freshwater, the fate of its recombinant DNA is less predictable. EFFECTS AND BEHAVIOUR OF POLLUTANTS DURING ARTIFICIAL GROUNDWATER RECHARGE.
Institut fuer Wasserforschung G.m.b.H., Dortmund (Germany, F.R.).
N. Zullei-Seibert, and U. Schoettler.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 475-486, 12 fig, 3 tab, 14 ref.

Descriptors: *Artificial recharge, *Germany, *Groundwater pollution, *Groundwater recharge, *Path of pollutants, *Underground waste disposal, *Water pollution sources, Adsorption, Aromatic compounds, Biodegradation, Disinfectants, Filtration, Heavy metals, Infiltration, Organic carbon, Organic pollutants, Pesticides, Water pollution treatment.

Groundwater as a main source for drinking water supply is affected by industrial, agricultural, and domestic pollution. Risk analyses based on detailed knowledge of the various processes related to infiltration and underground passage are necessary for the protection of drinking water supplies. Experiences during drinking water purification of the waterworks of Dortmund, Germany show that each variation in the concentration of groundwater pollutants is caused by remote complex processes which are dependent on the specific substances involved, the local conditions of the subsoil, and the amount and duration of the pollution. The efficiency of infiltration and underground passage must be estimated with regard to high concentration of pollutants (caused by accidents) as well as to low concentrations over a long time (caused by agriculture or sewage discharge). The infiltrated water with its different components is subject to chemical, physical and biological processes such as filtration, flocculation, adsorption, and degradation. Polychlorinated biphenyls are easily adsorbed to particulate organic matter or accumulated by algae. Heavy metals show a high affinity for appropriate organic or inorganic adsorption structures, and possible remobilization with algal die down in the filter. Reactions within the recharge areas and their effects on the concentrations of pollutants can be described by black-box models. Additional information may be obtained by systematic classification of behavior patterns depending on substance specific properties. The substituted phenols may be easily degraded due to their

molecular structure. (See also W91-01211) (Geiger-PTT)

HYDROLYSIS OF CHLOROSTILBENE OXIDE: II. MODELING OF HYDROLYSIS IN AQUIFER SAMPLES AND IN SEDIMENT-WATER SYSTEMS.
Environmental Protection Agency, Athens, GA. Southeast Environmental Research Lab.
M. E. S. Metwally, and N. L. Wolfe.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 963-973, August 1990. 5 fig, 5 tab, 22 ref.

Descriptors: *Biodegradation, *Chlorostilbene oxide, *Fate of pollutants, *Groundwater pollution, *Hydrolysis, *Model studies, *Polycyclic aromatic hydrocarbons, *Toxicology, Aquifers, Hydrogen ion concentration, Kinetics, Sediment chemistry, Sorption.

Epoxides are a class of compounds that are formed as intermediates in the biological transformation of polycyclic aromatic compounds. The disappearance kinetics of 4-chlorostilbene oxide (CSO) were determined in aquifer samples and in sediment-water systems to derive kinetic expressions that describe heterogeneous effects. Disappearance rate constants were determined in heterolytic systems and compared with those obtained in distilled water to delineate the effect of solids on the kinetics of hydrolysis. In both neutral and acid hydrolysis studies, the sorption-desorption rates of CSO were faster than the hydrolysis rates in either the aqueous or sediment-sorbed phases. Both dissolved and sorbed CSO hydrolyzed at either neutral or acidic pHs. Above pH 5, where neutral hydrolysis dominates, the hydrolysis rate constant of CSO in sterile sediment-water systems was the same as in distilled water. This suggests that sorption neither retards nor promotes the natural hydrolysis pathway. At pHs below 5, where acid hydrolysis dominated, the pseudo-first-order hydrolysis rate constant was lower for the sorbed fraction than the rate constant in distilled water at the same pH. This indicates that the hydrolysis rate constant in the sorbed phase is slower than that in the bulk aqueous phase. Kinetics of hydrolysis were studied in raw sediment samples and samples sterilized by heat or with formalin to distinguish between abiotic and biotic hydrolysis processes. Above pH 5, the hydrolysis rate constants were larger in nonsterile systems when compared with the rate constants in the sterile systems, suggesting that both biotic and abiotic pathways contribute to the disappearance of CSO. Below pH 5, the hydrolysis rate constants were, within experimental error, the same in the sterile and nonsterile systems. In aquifer samples, the average disappearance rate constant of CSO was 0.000085 (+ or -0.000011)/min, which is about the same as the rate constant in distilled water. These results suggest that there is no heterolytic enhancement of the neutral hydrolysis rate constant by the aquifer materials. (Author's abstract)

EFFECT OF BODY SIZE ON THE UPTAKE AND BIOCONCENTRATION OF DI-2-ETHYLHEXYL PHTHALATE IN RAINBOW TROUT.
Washington State Univ., Pullman. Coll. of Pharmacy.
D. D. Tarr, M. G. Barron, and W. L. Hayton.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 989-995, August 1990. 7 fig, 1 tab, 29 ref. NIH Grant ES 01995 and EPA Grant R812818.

Descriptors: *Animal metabolism, *Bioaccumulation, *Biological magnification, *Fish, *Fish physiology, *Path of pollutants, *Phthalates, *Toxicology, *Trout, Bioassay, Growth stages, Kinetics, Model studies.

Di-2-ethylhexyl phthalate (DEHP) is widely used as a plasticizer in the production of polyvinyl chloride. Three groups of rainbow trout (Salmo gairdneri) having average body weights of 2.9, 61 and 440 g were exposed at 12 C by the water to di-2-ethylhexyl phthalate. The kinetics of uptake and bioconcentration were characterized in each group using a compartmental model. Most of the model parameters, when expressed per unit body weight, were similar in the three sizes of fish. The two major exceptions were the uptake rate parameter, a measure of the capacity of the gill to extract DEHP from water and the apparent size (volume of distribution) of the large DEHP storage compartment, which is a measure of the capacity of the fish to accumulate DEHP. The values of these parameters declined as body weight increased; they followed the allometric equation with body weight exponents of 0.44 and 0.77, respectively. The body weight-associated changes in the pharmacokinetic parameters caused the bioconcentration factor to decline as body weight increased from 51.5 to 1.6. (Author's abstract)

Descriptors: *Aroclors, *Bioaccumulation, *Mollusks, *Path of pollutants, *Polychaetes, *Sediment contamination, *Toxicology, Equilibrium, Mathematical models, Model studies, Organic carbon, Polychlorinated biphenyls, Population exposure, Sediment analysis, Tissue analysis.

The utility and limits of applicability of a simple equilibrium partitioning model for predicting the maximum concentration of neutral organic compounds which can be accumulated by infaunal organisms exposed to a contaminated sediment were examined. Accumulation factors (AFs) for PCBs, the lipid normalized PCB concentration in organisms divided by the organic carbon normalized PCB concentration in sediments, were measured for PCBs in infaunal mollusks and polychaetes at field sites with a range of sediment Aroclor (A-1254) and total organic carbon (TOC) concentrations. The average AFs for A-1254 were found to be higher (average = 4.94; range 3.76 to 7.27) at sites with lower contaminant concentrations (15.0 to 48.3 ng A-1254/g dry sediment) than at more contaminated sites (328-9200 ng/g), where AFs were lower (average = 2.62; range 1.14 to 5.04). AF data grouped on the basis of sediment A-1254 and TOC concentration differed statistically between, but not within each group. Significant differences in mean AFs were found between some species and were lower than that found for bioaccumulation factors on a wet weight basis, indicating the utility of lipid and organic carbon normalization. POLLUTION ASPECTS OF STORM-SEWAGE OVERFLOWS.
Sheffield City Polytechnic (England).
D. J. Balmforth.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 219-226, June 1990. 8 fig, 1 tab, 12 ref.

Descriptors: *Combined sewer overflows, *Sewer systems, *Storm wastewater, *Storm-overflow sewers, *Urban hydrology, *Wastewater pollution, *Water pollution sources, Field tests, Model testing, Overflow, Path of pollutants, Pollutants, Stilling basins, Storm runoff, Storm sewers, Stream pollution, United Kingdom.

Storm-sewage overflows are one of the principal sources of urban river pollution in the United Kingdom. Various possible pollutants, such as carbon compounds, faecal matter, toxic pollutants, nutrients, bacterial pollutants such as E. coli bacteria, and their effect on the receiving stream are outlined. Features of individual overflow structures which are likely to lead to unsatisfactory performance are also detailed. These include any overflow that has dry-weather evidence of pollution; causes reduction in river classification; discharges to a watercourse which is used for amenity purposes; provides insufficient relief to the sewerage system downstream; suffers from siltation and/or blockage; is structurally unsound; or has difficult or unsafe access. Since the rationalization and rehabilitation of storm-sewage overflows should only be considered as part of a more general drainage area study, a strategy for rationalization is presented which identifies objectives for effective design and operation. It discusses, in particular, how chambers may be proportioned to give effective separation of visible pollutants. By combining field data with the results of model tests, a comparison of the performance of the main recommended types of overflow structure was made. Maintenance and safety measures include: proper venting; correct throttle design; prevention of solids accumulation on the floor; and safe adequate access points. (Author's abstract)

CHLORINATED SOLVENTS IN UK AQUIFERS.
Waterloo Univ. (Ontario). Inst. for Ground Water Research.
M. O. Rivett, D. N. Lerner, and J. W. Lloyd.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 242-250, June 1990. 5 fig, 4 tab, 45 ref.

Descriptors: *Chlorinated hydrocarbons, *England, *Groundwater pollution, *Path of pollutants, *Solvents, *Water pollution sources, Aquifer characteristics, Groundwater data, Monitoring, Water quality.

Background data on chlorinated solvents and all published data on chlorinated solvents in United Kingdom groundwater was reviewed. New data from an aquifer-wide survey of the organic water quality of the Birmingham aquifer (carried out by the University of Birmingham and the Water Research Centre (WRC)) show that contamination by chlorinated solvents is extensive and is greater than that observed in previously published United Kingdom studies. Trichloroethylene contamination is particularly apparent in the Birmingham aquifer, with 40% of the boreholes sampled containing waters above the new UK limit for this contaminant. Fortunately the Birmingham aquifer is not used for public supply. Land use and hydrogeological factors are shown to influence the contamination observed in particular boreholes. The difficulties associated with locating contaminated zones in aquifers, due to the immiscible flow of chlorinated solvents make it difficult to locate the actual source and hence to remove it. Development in the understanding of how solvents move in the subsurface, better field methods to observe aquifer contamination, and computer models to predict with greater accuracy the movement of solvents are all required to observe and remediate aquifer contamination by chlorinated solvents. APPRAISAL OF THE POTENTIAL HEALTH IMPACTS OF SEWAGE DISPOSAL TO UK COASTAL WATERS.
Saint David's Univ. Coll., Lampeter (Wales). Centre for Research into Environment and Health.
F. Jones, D. Kay, R. Stanwell-Smith, and M. Wyer.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 295-303, June 1990. 1 tab, 69 ref.

Descriptors: *Coastal waters, *Hazard assessment, *Marine pollution, *Population exposure, *Public health, *Risk assessment, *United Kingdom, *Wastewater pollution, *Water pollution sources, *Water quality standards, Disinfection, Epidemiology, Wastewater disposal.

The discharge of sewage to the unique United Kingdom (UK) coastal environment has been a traditional and cost-effective means of treatment for many decades. This disposal option is increasingly questioned by professionals with public-health responsibilities as well as by environmental

LIBRARY U. OF I. URBANA-CHAMPAIGN

pressure groups. There are limited firm data on the epidemiological significance of existing disposal practices: the established prospective methods, developed by north American workers in this area, have not provided a scientifically-robust, epidemiological, research protocol. This leaves a scientific vacuum for those with operational and policy responsibilities in this important and sensitive area of water resource management. Primary treatment of effluents is essential at all discharges to coastal waters. However, this will not guarantee compliance with European Community (EC) Directive standards and does not ensure the absence of epidemiological risk. Complementary treatment options, such as ultraviolet and ozone disinfection should be evaluated. (Author's abstract)

ACID DEPOSITION IN CENTRAL JAPAN.
Iowa Univ., Iowa City. Dept. of Chemical and Biochemical Engineering.
Y. S. Chang, B. S. Ravishanker, G. R. Carmichael, H. Kurita, and H. Ueda.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2035-2049, August 1990. 10 fig, 3 tab, 17 ref. EPRI Contract RP 1630-49.

Descriptors: *Acid rain, *Japan, *Path of pollutants, *Water pollution sources, Air pollution, Model studies, Nitrates, Nitrites, Simulation analysis, Sulfates.

Previous studies on the long-range transport of pollutants in central Japan have focused on the production and transport of photochemical oxidants. Highly polluted air is found in the central mountainous areas late in the afternoon on clear summer days, resulting from the transport of pollutants from the Tokyo Metropolitan area. The impact of this long-range transport (LRT) on acid deposition at these inland regions is evaluated by simulating a series of hypothetical storms under LRT conditions using the STEM II model. Nitrate and SO4 concentrations in the rainwater in excess of 100 micromolar are predicted, indicating that the total wet deposition of NO3 exceeds that of SO4 by a factor of 2. The wet deposition during evening storms is nearly 100% higher than that during afternoon storms. Simulations with 50% reductions in NOx and SOx emissions decrease the wet deposition of NO3 and SO4 by 40% and 15%. (Author's abstract)

TRENDS OF AIR QUALITY AND ATMOSPHERIC DEPOSITION IN TOKYO.
Tokyo Metropolitan Research Inst. for Environmental Protection (Japan).
T. Komeiji, K. Aoki, I. Koyama, and T. Okita.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2099-2103, August 1990. 12 fig, 1 tab, 6 ref.

Descriptors: *Acid rain, *Air pollution, *Japan, *Path of pollutants, *Tokyo, *Water pollution sources, Nitrates, Nitrogen compounds, Sulfates, Sulfur dioxide.

In the late 1960s and early 1970s the levels of SO2 and SO4 airborne particulate matter and its elemental compositions were high in Tokyo. However, in the 1970s their levels rapidly declined because of emission controls and fuel and material switching. Although the usage of heavy oil of high sulfur content temporarily increases SO2 concentration, the introduction of desulfurization processes for heavy oil reduced the SO2 concentration drastically. Concurrently, SO4(2-) concentrations in rain water also rapidly declined. On the other hand, despite significant emission control of NOx, from stationary and mobile sources, NOx and consequent NO3(-) levels in air and precipitation have not reduced. This is due to the increased number of automobiles, particularly of diesel powered trucks. Recently, this decline has slowed down. The number of days in which Mt. Fuji is visible from Tokyo have increased in coincidence with the decrease of particulate matter concentrations. A decrease in the deposition of SO4 and other species also reflects the decline of air pollution. However, the atmospheric concentration and deposition of oxides of nitrogen have not decreased because of the increase in the number of automobiles. It is also recognized that the alteration of structures in the city changes air quality. (Lantz-PTT)

ANALYSIS OF RADM GAS CONCENTRATION PREDICTIONS USING OSCAR AND NEROS MONITORING DATA.
State Univ. of New York at Albany. Atmospheric Sciences Research Center.
P. Middleton, and J. S. Chang.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2113-2125, August 1990. 2 fig, 3 tab, 30 ref. EPA Contract 68D80016.

Descriptors: *Acid rain, *Data interpretation, *Model studies, *Path of pollutants, *Regional Acid Deposition Model, Data acquisition, Nitrogen compounds, Northeast Regional Oxidant Study, Oxidation and Scavenging Characteristics, Ozone, Sulfur dioxide.

The ability of the Regional Acid Deposition Model (RADM) to produce realistic atmospheric trace gas concentration patterns for a variety of atmospheric conditions is explored by comparing model results with surface monitoring data. Two frontal storm system episodes, monitored in 1981 as part of the Oxidation and Scavenging Characteristics of April Rains (OSCAR) experiment, and one relatively dry high pressure-system case from the 1979 Northeast Regional Oxidant Study (NEROS) were studied. The temporal and spatial variations of SO2, O3 and N species monitored at selected locations throughout the US and Canada were compared to the corresponding RADM grid-average predictions. Spatial distributions of SO2 and O3 daytime (10a-4p) and night-time (10p-4a) RADM concentration averages were compared to the observational averages to confirm that the model and data concentration patterns agreed over the domain. Predictions and observations showed similar patterns of high and low concentrations throughout the region for all three of the events for the daytime comparisons; the lower night-time agreement improved when night-time stability adjustments were applied to the model predictions. Summarizing over all of the individual grid-point, day-total comparisons for all three events, it was found that, for O3, all of the pairs were in agreement to better than a factor of two, and 50% of them were in agreement to a factor of 1.1 or better. For SO2, 88% of the pairs were in agreement to better than a factor of two and 25% of the pairs were in agreement to a factor of 1.1 or better. Predicted N species concentrations in the 1-4 and 5-7 ppm ranges for two OSCAR cases were comparable to the levels measured at a rural Indiana site during the OSCAR 1 and the OSCAR 4 events. Predictions of NEROS NO in the 3-11 ppb range were comparable with the concentrations measured at a rural Pennsylvania site for a summer 1986 case meteorologically similar to the 1979 NEROS I event. In general, higher agreement is associated with well mixed conditions in areas where local characteristics of the observational site more closely resemble the grid-average characteristics. ACID RAIN MODEL DEVELOPMENT CONSIDERING ALTITUDINAL PRECIPITATION RATE.
Korea Advanced Inst. of Science and Technology, Seoul (Republic of Korea). Dept. of Civil Engineering.
J. K. Koo, S. O. Ko, and M. S. Hong.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2133-2139, August 1990. 8 fig, 3 tab, 15 ref.

Descriptors: *Acid rain, *Mathematical models, *Model studies, *Path of pollutants, Aerosols, Air pollution, Cloud physics, Physicochemical properties, Simulation analysis.

A one dimensional Eulerian model is developed to investigate the effect of physico-chemical parameters on the acidification processes of raindrops. The model is structured to treat the complex cloud's microphysical processes in a highly parameterized fashion. For a 1 h rain event simulation, gas depletion ratios range from 35 to 60% for HNO3, 40 to 70% for NH3, and 25 to 30% for SO2. Also, a formula is proposed to predict the rain acidity on the ground using known values of gaseous SO2 concentration, the height of the rain growth zone, and precipitation rate. The model can be extended to incorporate the cloud microphysical processes in a more sophisticated manner and, in the future, be extended to include aerosol capturing mechanisms. (Lantz-PTT)

SEMI-EMPIRICAL APPROACH TO ESTIMATE VERTICAL TRANSPORT BY NONPRECIPITATING CONVECTIVE CLOUDS ON A REGIONAL SCALE.
Research Triangle Inst., Research Triangle Park, NC.
F. M. Vukovich, and J. K. S. Ching.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2153-2168, August 1990. 13 fig, 1 tab, 29 ref. EPA Contract 68-02-4059.

Descriptors: *Acid rain, *Cloud physics, *Convective clouds, *Mathematical analysis, *Path of pollutants, *Vertical transport, Clouds, Cumulus clouds, Dewpoint, Fluctuations, Sensitivity analysis, Temperature.

A semi-empirical approach was used to estimate the vertical flux of mass of water and pollutants between the boundary layer and the cloud layer in an ensemble of nonprecipitating cumulus clouds. This CUVENT model determines the existence of the cloud ensemble, estimates the cloud amount at cloud base, and establishes the vertical distribution of the convective cloud amount attributed to a cloud population, having a continuous spectrum of cloud depth, using standard meteorological data. The mass flux is then estimated for the ensemble or for a processor cloud, a single cloud which on the average can be used to represent the ensemble using a modified version of the cloud model. Sensitivity analysis of CUVENT examined the behavior of the model as the vertical distribution of temperature and dewpoint changed from one atmospheric state to another. For the initial study, the temperature profile was held constant, and the dew profile varied. In a moist dewpoint profile, there was a small dewpoint depression, on the average, above the top of the boundary layer. In another case, a relatively dry dewpoint profile was used. In all cases, the cloud amount at cloud base was set equal to 1.0. Having cloud amounts < 1.0 will effect the quantitative results more than the qualitative results. In the next analysis, the dewpoint profile was held constant, but the temperature profile above cloud base and in the cloud layer varied. In the first case, the temperature decreased with height through the cloud layer. In the second case, an isothermal layer existed in the cloud layer. In the case where the temperature decreased with height through the cloud layer, the cloud thickness is approximately 1500 m and the maximum vertical velocity is near cloud base and is 53 cm/sec. CHEMISTRY OF DEWS AND FROSTS IN INDIANAPOLIS, INDIANA.
Butler Univ., Indianapolis, IN. Holcomb Research Inst.
J. R. Foster, R. A. Pribush, and B. H. Carter.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2229-2236, August 1990. 3 fig, 4 tab, 32 ref. Air Force Office of Scientific Research Grant AFOSR-85-0223.

Descriptors: *Acid rain, *Chemical analysis, *Dew, *Frost, *Indianapolis, *Path of pollutants, Acidification, Air pollution, Calcium, Carbon dioxide, Hydrogen ion concentration, Magnesium, Nitrogen dioxide, Pollutant identification, Potassium, Sodium, Sulfur dioxide.

Dews and frosts forming on chemically Teflon surfaces were sampled for pH and ion concentrations during a 13 month period in urban Indianapolis, Indiana. It was predicted that dews forming in this polluted atmosphere would be acidic due to absorption of SO2, NO2 and CO2, but that frost pH would be neutral due to the lack of gas absorption. However, measured pH ranged from 6.0 to 7.2, and dew and frost pH were not significantly different. Anion and cation concentrations did not differ between dews and frosts, implying similar mechanisms and rates for scavenging of atmospheric chemicals. Sulfite and nitrite were present in many samples, indicating SO2 and NO2 absorption by both dews and frosts. The presence of ions (K, Ca, Mg, Na) lacking gaseous sources suggested that sedimentation of aerosols, primarily carbonates and salts, from surrounding agricultural lands occurred into dews and frosts as they formed. Carbonate deposition may have been responsible for near-neutral dew and frost pH. Dews sampled from sugar maple leaves were depleted of ammonium and enriched in other ions, but did not differ substantially in pH, compared to dews simultaneously sampled from Teflon. Temporal (overnight) sampling of dews on Teflon showed that dew chemistry changed substantially during the course of the night. (Author's abstract)

DEVICE FOR IN SITU DETERMINATION OF GEOCHEMICAL TRANSPORT PARAMETERS. 1. RETARDATION.
Waterloo Univ. (Ontario). Dept. of Earth Sciences.
R. W. Gillham, M. J. L. Robin, and C. J. Ptacek.
Ground Water GRWAAP, Vol. 28, No. 5, p 666-672, September/October 1990. 4 fig, 1 tab, 12 ref.

Descriptors: *Data acquisition, *Geochemistry, *Groundwater pollution, *In situ tests, *Path of pollutants, *Tracers, Aquifers, Augers, Measuring instruments, Organic compounds, Strontium.

The retardation factor for dissolved chemicals in groundwater is an important parameter in predicting the rate of migration of contaminants and in the design of remediation schemes for contaminated aquifers. Conventional methods for evaluating retardation factors include laboratory batch and column tests, and in the case of nonpolar organic contaminants, correlations with the organic carbon content of the aquifer material. In these procedures it is difficult to insure the geochemical integrity of the sediment material and the solutions used in the tests, leading to uncertainties concerning the applicability of the results. Alternatively, large-scale tracer tests can be conducted; however, because of the time and cost requirements, these procedures have generally been limited to research applications. A description is provided of an in situ column procedure for measuring retardation factors. This column is installed in advance of the cutting head of hollow-stem augers, minimizing the geochemical disturbance of the sediment. The sediment within the column is exposed only to natural ground water from the immediate vicinity of the test device. By maintaining geochemical integrity, the method has considerable advantages over laboratory procedures, while being substantially less costly than conventional field tracer tests. Two tests were conducted with the device in which retardation factors for strontium and for five halogenated organic compounds were found to be in good agreement with results obtained by conventional methods. (Author's abstract)

LOGNORMAL DISTRIBUTION OF RADON CONCENTRATION IN GROUND WATER.
Ecole Polytechnique, Montreal (Quebec).
L. Zikovsky, and B. Chah.
Ground Water GRWAAP, Vol. 28, No. 5, p 673-676, September/October 1990. 1 fig, 1 tab, 17 ref.

Descriptors: *Data interpretation, *Distribution, *Groundwater pollution, *Path of pollutants, *Radon, Mathematical studies, Statistical analysis, Statistical methods, Uranium.

Data on the concentration of radon in groundwater were compiled from the literature. From this compilation the means, medians, modes, standard deviations, coefficients of skewness and histograms have been calculated. The histograms were compared with the normal and lognormal distribution functions using chi-square test values for goodness of fit. Based on this, the concentrations were found to be lognormally distributed in all cases studied but one. The measured medians and modes were compared with their theoretical counterparts assuming either normality or lognormality; lognormality was found once more. The comparisons of chi-square test values, the differences between the measured medians and means or geometrical means, and the differences between measured modes and means or geometrical modes show that the concentration of radon in groundwater is lognormally distributed. In such cases, reporting only arithmetic means may create a false impression about exposure levels due to radon. A median or mode as a measure of central tendency would be more appropriate. The lognormality appears to be a consequence of heterogeneous distribution of uranium in soils and rocks. (Lantz-PTT)

USE OF TREE-RING CHEMISTRY TO DOCUMENT HISTORICAL GROUND-WATER CONTAMINATION EVENTS.
Geological Survey, Columbia, SC. Water Resources Div.
D. A. Vroblesky, and T. M. Yanosky.
Ground Water GRWAAP, Vol. 28, No. 5, p 677-684, September/October 1990. 9 fig, 27 ref.

Descriptors: *Chemical analysis, *Data acquisition, *Dendrochronology, *Groundwater pollution, *History, *Path of pollutants, *Tree rings, Chlorides, Chlorine, Groundwater movement, Iron, Landfills, Yellow poplar.

The annual growth rings of tulip trees (Liriodendron tulipifera L.) appear to preserve a chemical record of groundwater contamination at a landfill in Maryland. Zones of elevated iron and chlorine concentrations in growth rings from trees immediately downgradient from the landfill are closely correlated temporally with activities in the landfill expected to generate iron and chloride contamination in groundwater. Successively later iron peaks in trees increasingly distant from the landfill along the general direction of groundwater flow imply movement of iron contaminated groundwater away from the landfill. The historical velocity of iron movement (2 to 9m/yr) and chloride movement (at least 40 m/yr) in groundwater at the site was estimated from element concentration trends of trees at successive distances from the landfill. The tree ring derived chloride transport velocity approximates the known groundwater velocity (30-80 m/yr). A minimum horizontal hydraulic conductivity (0.01 to 0.02 cm/s) calculated from chloride velocity agrees well with values derived from aquifer tests (about 0.07 cm/s) and from groundwater modeling results (0.009 to 0.04 cm/s). INFILTRATION OF IMMISCIBLE CONTAMINANTS IN THE UNSATURATED ZONE.
Louisiana State Univ., Baton Rouge. Dept. of Chemical Engineering.
D. D. Reible, T. H. Illangasekare, D. V. Doshi, and M. E. Malhiet.
Ground Water GRWAAP, Vol. 28, No. 5, p 685-692, September/October 1990. 6 fig, 1 tab, 15 ref.

Descriptors: *Aeration zone, *Immiscibility, *Infiltration, *Model studies, *Path of pollutants, *Soil water, *Unsaturated zone, Groundwater pollution, Permeability, Vadose zone.

The presence of a nonaqueous liquid phase in the subsurface often controls the rate and magnitude of groundwater contamination. In addition, remediation efforts that do not directly address the nonaqueous phase material are unlikely to provide cost-effective or timely solutions to groundwater contamination risk. Practical modeling tools that describe the fate and transport of a separate contaminant phase are described. Simple sharp front models that parameterize the capillary pressure and relative permeability relationships into effective coefficients can describe the main features of the unsaturated zone infiltration behavior of nonaqueous phase liquids. Experiments have indicated that infiltration of an immiscible organic phase into an initially residually water saturated vadose zone can be predicted using only the spill volume and area, the intrinsic permeability of the medium, the residual and irreducible residual of the infiltrating liquid in the medium, and the capillary rise height of the infiltrating liquid in the medium. The ultimate depth of infiltration can be estimated from only the initial volume and area of the spill and the residual chemical saturation in the soil. This simple modeling approach should be applicable to vadose zone infiltration of any nonaqueous phase that does not disrupt the properties of the soil medium. Volatile chemical infiltration also can be described, but the model is only applicable until vaporization results in a significant loss of mass. In practice, the approach is limited to essentially homogeneous, sandy soils in that fingering in and around heterogeneities, chemical-media interactions (such as electrical interactions with clays) are not considered, and sharply defined capillary pressure versus saturation behavior is assumed. LIBRARY U. OF I. URBANA-CHAMP.

The KL Landfill in Kalamazoo County, Michigan was closed in June 1979 because of groundwater contamination. Study of water analyses from a monitoring well network has provided insight into a variety of pH and redox buffering reactions within the contaminated plume. The reactions involved in pH and redox buffering are important in controlling the concentrations of many major and minor chemical species in the KL Landfill contaminant plume. Acid leachate causes carbonate material dissolution which, in turn, buffers the pH in the glacial drift aquifer at or near neutral background levels. Increases in calcium, magnesium, and bicarbonate concentrations result from these buffering reactions, thereby increasing the saturation indices of carbonate minerals in groundwater. Supersaturation of carbonate minerals persists possibly because precipitation is retarded kinetically and/or inhibited by complexation of cations with organic ligands in solution or blockage of nucleation sites on mineral surfaces. Determination of saturation indices based on uncorrected titration alkalinities may overestimate carbonate mineral saturation levels because the resulting bicarbonate concentrations erroneously include organic acid anions. Redox reactions in the contaminant plume include oxidation of dissolved organic compounds coupled with reduction of oxidized compounds in dissolved or solid phases. Specific reactions include the reduction of iron and manganese contained in oxyhydroxide solid phases. Dissolved iron concentrations as high as 50 mg/L are attributed to this reaction. Siderite precipitation provides a possible solubility control for iron concentrations in the plume when the saturation index reaches a value of approximately 2.0. It is also possible that dissolved iron persists above saturation levels with respect to carbonate and sulfide phases because of complexation with organic acid ligands. Sulfide mineral precipitation may maintain sulfide concentrations in the plume at very low levels. (Lantz-PTT)

TRIAZINE AND CHLOROACETAMIDE HERBICIDES IN SYDENHAM RIVER WATER AND MUNICIPAL DRINKING WATER, DRESDEN, ONTARIO, CANADA, 1981-1987.
Ontario Ministry of Agriculture and Food, Guelph. Agricultural Lab. Services Branch.
R. Frank, B. S. Clegg, C. Sherman, and N. D. Chapman.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 319-324, May/June 1990. 1 fig, 4 tab, 14 ref.

Descriptors: *Atrazine, *Canada, *Drinking water, *Herbicides, *Triazines, *Water pollution sources, *Water treatment, Alachlor, Charcoal, Chlorination, Cyanazine, Metolachlor, Metribuzin, Ontario, Pollutant identification, Water pollution.

Herbicide residues were measured in the Sydenham River to determine if these residues were still present in subsequent drinking-water supplies following chlorination. Samples of raw river water from the Sydenham River, Ontario were collected 30 to 50 times per year between 1981 and 1987 along with paired samples of drinking water from the town of Dresden, Ontario, Canada. Atrazine and its metabolite, diethyl atrazine, were found in 89 to 100% of the raw water over the seven year period. Alachlor was found only in 1982, 1984 and 1985 when 2 to 17% of raw waters were contaminated. Cancellation of the registration to use alachlor at the end of 1985 resulted in no residues being found in 1986 and 1987. Cyanazine was found in 3 to 29% (1982-87), metolachlor in 19-27% (1984-87) and metribuzin in 2-7% (1982-86) of raw river water. Comparison of those residues in raw water with those in drinking water revealed that chlorination of river water had no effect in reducing herbicide concentrations. During 1985 the addition of up to 50 mg/L of powdered charcoal to raw water reduced residues to near to below detection limits for s-triazine and chloracetamide herbicides. However, in 1986, with a reduced rate of 20 mg/L of charcoal herbicide residues were only slightly reduced and in 1987 with only 5 mg/L no reductions occurred. (Author's abstract)

PHOTOCHEMISTRY OF HALOGENATED BENZINE DERIVATIVES. XI. EFFECTS OF SODIUM CHLORIDE ON THE AQUATIC PHOTODEGRADATION OF BROMOXYNIL (3,5-DIBROMO-4-HYDROXYBENZONITRILE) HERBICIDE.
Manitoba Univ., Winnipeg. Dept. of Soil Science.
J. Kochany, G. G. Choudhry, and G. R. B. Webster.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 325-331, May/June 1990. 5 fig, 1 tab, 21 ref.

Descriptors: *Benzenes, *Fate of pollutants, *Halogenated pesticides, *Herbicides, *Path of pollutants, *Photodegradation, *Photolysis, *Sodium chloride, Bromoxynil, Photochemistry, Water chemistry, Water pollution.

Aqueous solution phase photochemistry of the herbicide bromoxynil (3,5-dibromo-4-hydroxybenzonitrile) in the presence of various concentrations of sodium chloride was extensively investigated with ultraviolet radiation near 313 nm. In the presence of 0.0005 to 0.025 moles NaCl, the quantum yields for the phototransformation of the herbicide bromoxynil amounted to 0.045 +/-0.005 to 0.017 +/-0.007 vs. 0.052 +/-0.004 in the absence of sodium chloride. These quantum yield data for the photolysis of the herbicide bromoxynil followed the Stern-Volmer equation. The photolysis of the 0.0000078 molar aqueous solution of the herbicide bromoxynil in the presence of sodium chloride gave rise to the formation of 3-bromo-4-hydroxybenzonitril, 3-bromo-5-chloro-4-hydroxybenzonitril, 3-chloro-4-hydroxybenzonitril, and 4-hydroxybenzonitril. The products 3-bromo-5-chloro-4-hydroxybenzonitril and 3-chloro-4-hydroxybenzonitril were formed via the photoincorporation of chloride ions into bromoxynil and into the primary photoproduct 3-bromo-4-hydroxybenzonitril. In the case of this photoreaction, the percentages of maximum concentrations of the following photoproducts were obtained after exposures to UV light: 3-bromo-5-chloro-4-hydroxybenzonitril at 10.5 minutes; 3-bromo-4-hydroxybenzonitril at 20.0 minutes; 3-chloro-4-hydroxybenzonitril at 30.0 minutes; and 4-hydroxybenzonitril at 44.0 minutes. 90% disappearance of the starting material was with 44-minute photolysis. The formation of 4-hydroxybenzonitril decreased with the rise in concentration of NaCl. When a mixture of aqueous solutions of 3.0 ml bromoxynil plus 0.5 ml NaCl was exposed to UV light for up to 3 hours, the photoproduct 4-hydroxybenzonitril could not be observed; however, other products, namely, phenols 3-bromo-4-hydroxybenzonitril, 3-bromo-5-chloro-4-hydroxybenzonitril, and 3-chloro-4-hydroxybenzonitril were produced. (Mertz-PTT)

Descriptors: *Bioaccumulation, *Bioassay, *Bioindicators, *Cadmium, *Crustaceans, *Heavy metals, *Path of pollutants, *Salinity, *Shrimp, *Temperature effects, *Toxicology, Grass shrimp, Synergistic effects, Toxicity, Water pollution, Water temperature.

The combined effects of salinity, temperature, and cadmium on the accumulation of cadmium-binding protein were studied in the grass shrimp, Palaemonetes pugio. In 96-hour bioassays, shrimp were exposed either to zero or to one of three concentrations of cadmium (0.50, 1.00, and 1.60 mg/L), under three different salinities (15, 25, and 35 parts per thousand) at two different temperatures (20 and 30 C). Cadmium-binding protein concentrations were quantified in survivors from the 24 exposure groups. Salinity and temperature did not affect survivorship unless the shrimp were also exposed to cadmium. P.pugio produced a 10,000-dalton metallothionein-like cadmium-binding protein when exposed to at least 0.1 mg Cd(2+)/L for 96 hours. Accumulation of cadmium-binding protein was elevated when either the level of cadmium or temperature was increased or salinity was decreased. Grass shrimp surviving the salinity-temperature-cadmium conditions associated with highest mortality exhibited the highest levels of cadmium-binding protein. Thus, cadmium-binding protein accumulation is not only related to cadmium exposure, but can be synergistically affected by environmental factors as well. When the biota are stressed to the point of synthesizing measurable levels of metal-binding proteins a toxic or potentially toxic condition exists. Therefore, cadmium-binding protein accumulation can be used to assess the effects of cadmium stress on a biological level. (Mertz-PTT)

SELENIUM ACCUMULATION AND ELIMINATION IN MALLARDS.
Patuxent Wildlife Research Center, Laurel, MD.
G. H. Heinz, G. W. Pendleton, A. J. Krynitsky, and L. G. Gold.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 374-379, May/June 1990. 3 fig, 2 tab, 18 ref. San Joaquin Valley Drainage Program Intra-agency Agreement No. 6-AA-20-04170.

Descriptors: *Bioaccumulation, *Ducks, *Selenium, *Toxicology, *Water pollution effects, Chronic toxicity, Mallards, Mortality, Tissues, Toxicity, Water pollution.

Selenium accumulation and loss were measured in adult mallards (Anas platyrhynchos) fed selenomethionine during two experiments. In Experiment 1, both sexes were fed a diet containing 10 parts per million selenium for 6 weeks, followed by 6 weeks on untreated feed. Concentrations of selenium were predicted to reach 95% of equilibrium faster in liver (7.8 days) than in muscle (81 days). The loss of selenium from liver and muscle of females showed half-times of 18.7 for liver and 30.1 days for muscle. Males reached similar levels of selenium in liver and breast muscle as females and declined to similar levels once selenium treatment ended. In Experiment 2, females were fed increasing levels of selenium until some died. Survivors were switched to an untreated diet and selenium was measured in blood, liver, and breast muscle over 64 days. Half-times for loss of selenium from blood was 9.8 days and muscle was 23.9 days. Selenium initially decreased in liver by one-half in 3.3 days, with subsequent half times of 3.9, 6.0, and 45.1 days. PREDICTING BIOACCUMULATION POTENTIAL: A TEST OF A FUGACITY-BASED MODEL.
Environmental Research Lab.-Narragansett, Newport, OR. Mark O. Hatfield Marine Science Center.
S. P. Ferraro, H. Lee, R. J. Ozretich, and D. T. Specht.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 386-394, May/June 1990. 2 fig, 7 tab, 44 ref.

Descriptors: *Bioaccumulation, *Clams, *Fate of pollutants, *Fugacity, *Model studies, *Oregon, *Organic pollutants, *Path of pollutants, *Water pollution, Accumulation factor model, Mollusks.

Clams (Macoma nasuta) from an unpolluted site in Yaquina Bay, Oregon were exposed in the laboratory for 28 days to 6 field-contaminated sediments which varied widely in concentration of 10 organic pollutants. Mean accumulation factors (accumu

lation factors = concentration in tissue/lipid, %/100 divided by concentration in sediment per total organic carbon, %/100) of 8 neutral organic compounds (DDE(p,p'), 2,2',3,5'6-pentachlorobiphenyl, 2,3',4,4',5-penta-chlorobiphenyl, Aroclor 1254, pyrene, chrysene, benzo(a)pyrene, benzo(b,(k))fluoranthene) were homogeneous across treatments. Statistically significant differences were detected between some treatment accumulation factors for DDD(p,p') and benz(a)anthracene, and between some chemicals within treatments. Accumulation factors were less than 2 and less variable in highly polluted, organically enriched sediments (total organic carbon >/ = 3.69 +/-0.044%), but sometimes exceeded 2 in clams exposed to surficial (0-2 cm deep) sediments with low pollutant concentration and low organic carbon content (</= 0.86 +/-0.037%). These results suggest that the accumulation factor model may provide reasonable estimates of bioaccumulation potential of hydrophobic neutral organic compounds in organically enriched, polluted sediments. EFFECT OF PH ON THE ACCUMULATION KINETICS OF PENTACHLOROPHENOL IN GOLDFISH.
Washington State Univ., Pullman. Coll. of Pharmacy.
G. R. Stehly, and W. L. Hayton.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 464-470, May/June 1990. 4 fig, 3 tab, 26 ref. National Institutes of Health, United States Public Health Service grant ES 01995 and U.S. EPA grant R812818.

Descriptors: *Acid rain effects, *Bioaccumulation, *Chlorinated hydrocarbons, *Fish physiology, *Hydrogen ion concentration, *Path of pollutants, *Pentachlorophenol, *Toxicity, *Water pollution effects, Carassius, Goldfish, Kinetics, Metabolism.

The kinetics of accumulation of pentachlorophenol at various pH values were investigated to explore how pH-dependent accumulation might influence pentachlorophenol toxicity. Goldfish (Carassius auratus) were exposed to 5 microgram pentachlorophenol/L in a static system buffered with 7.5 micromoles bicine or N,N-bis(2-hydroxyethyl)-2-aminoethane sulfonic acid at pH 7.0, 8.0, or 9.0. The amount of pentachlorophenol in the fish, concentration of pentachlorophenol in water, and the total amount of metabolites in the system were measured after exposure of fish from 1 to 96 hours. Equations for these variables based on a two compartment pharmacokinetic model were fitted simultaneously to the data using the model NONLIN, which uses an iterative nonlinear least squares technique. Uptake clearance, metabolic clearance, and apparent volume of distribution of pentachlorophenol decreased as pH increased. The decrease in pentachlorophenol accumulation with increased pH was not due solely to a pH-induced decrease in uptake. In addition, the distribution of pentachlorophenol within the fish was altered by changes in the external pH. The pH-associated changes in distribution may have altered access of pentachlorophenol to sites of metabolism, thereby altering the metabolic clearance. The pH-related changes in the pharmacokinetics of pentachlorophenol resulted in a decrease in its bioconcentration factor with an increase in pH and account both for the decreased capacity of the fish to accumulate pentachlorophenol and for its reduced LC50. POLYCHLORINATED BIPHENYLS IN HOUSATONIC RIVER SEDIMENTS IN MASSACHUSETTS AND CONNECTICUT, USA: DETERMINATION, DISTRIBUTION, AND TRANSPORT.
Connecticut Agricultural Experiment Station, New Haven.
C. R. Frink, B. L. Sawhney, K. P. Kupl, and C. G. Fredette.
Environmental Auditor ENVAE8, Vol. 1, No. 2, p 79-130, 1990. 12 fig, 36 tab, 33 ref, 3 append.

Descriptors: *Massachusetts, *Path of pollutants, *Polychlorinated biphenyls, *River sediments, *Sediment contamination, Connecticut, Lake sediments, Lakes, Pollution load, Rivers, Water pollution.

Polychlorinated biphenyls (PCBs) have accumulated in the Housatonic River wherever sediments have accumulated. The concentration of PCBs in these sediments increased gradually with increasing distance upstream and then increased sharply in Woods Pond, the first impoundment below Pittsfield, Massachusetts. The distribution of PCBs within impoundments was found to be controlled by the distribution of fine-grained sediment. Calculations of the mass of PCBs in the river sediment indicate that, of the estimated total of 22,200 pounds, about 60% is in Massachusetts and nearly all of this amount is in sediment in Woods Pond. The remaining 40% of the total is in sediment in Connecticut: about 29% is in Lake Lillinonah, 10% is in Lade Zoar, and small amounts are at other locations. An anaylsis of these estimates indicates that errors should be within +/-50%. Transport of PCBs by suspended sediment down the river into Connecticut is estimated to be at the rate of 250 to 500 pounds per year. The results suggest that removal or containment of sediment in Woods Pond would help to alleviate further transport of PCBs into Connecticut. (Author's abstract)

Archiv fuer Hydrobiologie AHYBA4, Vol. 118, No. 4, p 403-419, June 1990. 6 fig, 4 tab, 44 ref.

Descriptors: *Carbon cycle, *Epilimnion, *Eutrophication, *Lake Lucerne, *Limnology, *Mesotrophic lakes, *Oligotrophic lakes, *Particulate matter, *Switzerland, *Water pollution effects, Excretion, Food habits, Lake turnover, Organic carbon, Particle size, Primary production, Respiration, Seasonal variation.

The carbon turnover in five different particle size classes (>/= 200 microm, 30-200 microm, 12-30 microm, 3-12 microm, </= 3 microm) was investigated in Lake Lucerne during 1984-1985. The smaller size fractions (</= 12 microm) were dominant in sestonic particulate organic carbon (POC) and primary production during summer stratification, whereas larger particles (>/= 30 microm) were abundant during winter turnover. Settling POC consisted mainly of large particles throughout the season. This pattern demonstrates the existence of biological particle transformation through zooplankton grazing (fecal pellet production), possibly supported by other biological and/or physico-chemical processes. Specific net increase rates of POC did not show much seasonal variation while scattering around zero. This is indicative of significant specific loss rates immediately compensating high production rates. POC sedimentation rates amounted to 12-39% of total loss in the larger size classes, and ca 20% of the primary production (193 g C ass/sq m/y) settled out of the epilimnion. Particulate C loss through washout did not significantly affect epilimnetic C turnover. Respiration was the dominant loss rate (68-79% of total loss in the size classes </= 12 microm). Grazing usually was not of great importance, except for the period in May/June when Daphnia grazed on abundant nannoplankton. Excretion was less than 7% of total loss in all size classes and did not contribute much to C turnover. It was concluded that epilimnetic C regeneration (including respiration, grazing, and excretion) amounted to ca 80% of the primary production, which is in the same range as P regeneration. COMPARISON OF HISTORICAL AND RECENT DATA ON HYDROCHEMISTRY AND PHYTOPLANKTON IN THE RIJNLAND AREA (THE NETHERLANDS).
Hoogheemraadschap van Rijnland, Leiden (Netherlands).
S. P. Klapwijk.
Hydrobiologia HYDRB8, Vol. 199, No. 2, p 87-100, July 24, 1990. 5 fig, 6 tab, 32 ref.

Descriptors: *Acid rain effects, *Canals, *Eutrophic lakes, *Eutrophication, *Phytoplankton, *The Netherlands, *Water chemistry, *Water pollution effects, Algal blooms, Biological oxygen demand, Chlorophyll a, Limiting nutrients, Nitrogen, Orthophosphates, Phosphorus, Transparency.

In two canals and two lakes in the western part of the Netherlands a comparison was made between data on water chemistry and phytoplankton from 1941/1942 and recent data. Orthophosphate, and to some extent inorganic nitrogen have increased greatly, particularly in the Gouwe canal where Rhine water enters the area. The inorganic N/P mass ratio decreased in the last 45 years, indicating that the limiting nutrient has changed from phosphate in 1941 to nitrogen in 1987. The average seston volume, measured by filtering 100 L water through a plankton net (50 microm), has doubled. Blooms of the blue-green alga Microcystis aeruginosa occurred both historically and recently. The disappearance or reduction of several plankton species indicates the community has become impoverished in the last decennia. There has been no change in the saprobic index. Chlorophyll-a and transparency for 1941 were estimated based on correlations between chlorophyll-a and biological oxygen demand (BOD) and between transparency and seston volume using the 1987 data. The average chlorophyll-a concentration in the lakes has doubled or tripled in the last 45 years and the mean transparency in the Gouwe canal declined from 75 to 50 cm. Submerged higher plants at some sites have disappeared in the last decode. Using these results, ecological objectives for combatting eutrophication in canals and lakes and possibly the river Rhine can be developed. (Author's abstract)

DISTRIBUTION OF SHORT CHAIN CARBOXYLIC ACIDS IN EUTROPHIC DRAINAGE CHANNELS.
Sussex Univ., Brighton (England). School of Biological Sciences.
P. W. G. Doldorph, and J. D. Thomas.
Hydrobiologia HYDRB8, Vol. 199, No. 3, p 243-260, July 31, 1990. 12 fig, 4 tab, 62 ref.

Descriptors: *Carboxylic acids, *Dissolved organic matter, *Drainage canals, *England, *Eutrophication, Acetates, Butanoate, Dissolved oxygen, Diurnal variation, Hypolimnion, Propanoate, Seasonal variation, Sediments, Stratification.

Although it is generally accepted that dissolved organic matter (DOM) plays a central role in the metabolism of freshwater systems, little is known about its chemical composition. Therefore, the short chain carboxylic acids which are one component of DOM were investigated. The concentration of the C2-C5 carboxylic acids in the water column and sediment of shallow, eutrophic, drainage channels (Lewes Brooks, UK) were measured by gas chromatography. The concentrations of

LIBRARY U. OF I. URBANA-CHAMPAIGN

these acids were negatively correlated with dissolved oxygen. The highest concentrations of acetate (up to 200 microM), propanoate (up to 38 microM) and butanoate (up to 1.2 microM) were measured during the summer in the water above the sediment, which became hypoxic during this period. Both acetate and propanoate concentrations declined at night. High concentrations of the acids were also recorded in reedbeds, which were also hypoxic. Only acetate was detected in the sediment pore water (up to 168 microM). Its concentration declined during the autumn and winter and with increasing depth within the sediment. The short chain carboxylic acid pool which accumulates in the hypolimnion and sediment of the drainage channels constitutes a potential source of energy for bacteria, algae, and invertebrates, particularly during periods of mixing of the water column following prolonged stratification that may occur during autumnal turnover of lakes. DRY DEPOSITION OF SULFUR: A 23-YEAR RECORD FOR THE HUBBARD BROOK FOREST ECOSYSTEM.
New York Botanical Garden, Bronx, NY. Inst. of Ecosystem Studies.
G. E. Likens, F. H. Bormann, L. O. Hedin, C. T. Driscoll, and J. S. Eaton.
Tellus TELLAL, Vol. 42B, No. 4, p 319-329, September 1990. 5 fig, 49 ref.

Descriptors: *Acid rain, *Chemistry of precipitation, *Dry deposition, *New Hampshire, *Sulfur, Experimental basins, Forest watersheds, Hubbard Brook, Mass-balance method, Precipitation, Regression analysis, Streams, Sulfur dioxide.

Dry deposition of S was estimated for watershed-ecosystems of the Hubbard Brook Experimental Forest, New Hampshire, from 1964-65 through 1986-87. Two approaches, a regression analysis of bulk precipitation inputs and stream outputs and a mass-balance method, gave similar average values for Watershed 6 (430 equivalents SO4(2-)/hectare/year for regression analysis and 410 equivalents SO4(2-)/hectare/year for the mass-balance over the 23-year period). Dry deposition contributed about 37% of total S deposition, varying from 12% in 1964-65 to 61% in 1983-1984. Long-term data from replicated watershed-ecosystems showed that temporal variability in estimates of dry deposition was considerably greater than spatial (between watersheds) variability. Therefore, when using the mass-balance method for estimating dry deposition, short-term estimates of S dry deposition may be influenced by hydrology and must be interpreted with caution. No long-term, linear trend in dry deposition of SO4(2-) was observed during the last 23 years, despite a 40% reduction in wet deposition of SO4(2-) and a similar decrease in emissions of SO2 in the northeastern U.S. These differences in deposition trends may be due to differences in source areas for wet and dry deposition and have policy implications relative to regulation of anthropogenic emissions. MATHEMATICAL MODEL OF BACTERIAL CONTAMINATION OF THE MORLAIX ESTUARY (FRANCE).
IFREMER, Paris (France).
J. C. Salomon, and M. Pommepuy.
Water Research WATRAG, Vol. 24, No. 8, p 983-994, August 1990. 10 fig, 13 ref.

Descriptors: *Bacteria, *Escherichia coli, *Estuaries, *France, *Model studies, *Morlaix Estuary, Salinity, *Path of pollutants, *Water pollution, Bacterial transport, Coliforms, Contamination, Mathematical studies, Shellfish, Water quality.

The sanitary problem of the Morlaix estuary (France) motivated the development of a physical/bacteriological mathematical model. The physical part of the model is based on well-known physical laws and, for testing and tuning purposes, only a few salinity measurements were necessary. Using a modeling procedure, knowledge concerning bacterial transport and disappearance can be attained that provides useful management information for minimizing fecal pollution in shellfishing areas such as Morlaix Bay. A set of two numerical models was built to simulate currents, water fluxes, transit times, trajectories, dispersion and bacterial decay. The models were tuned and fed by survival trials carried out in the field with Escherichia coli strains. Die-off rates ranged from 2 hours to 1 week. Model results compared well with in situ measurements and showed that, in all circumstances, physical dilution processes are much more efficient than mortality in this estuary. The last simulations provided suggestions for improving water quality in the study area. This modeling exercise is also of interest because the numerical code written for Morlaix estuary may be easily transformed for use in other coastal areas. The model is thus a general management tool useful in high hydrodynamic areas. (Mertz-PTT)

SPECIES-RELATED VARIATIONS OF SILVER BIOACCUMULATION AND TOXICITY TO THREE MARINE BIVALVES (VARIATIONS INTER-SPECIFIQUES DE LA BIOACCUMULATION ET DE LA TOXICITE DE L'ARGENT A L'EGARD DE TROIS MOLLUSQUES BIVALVES MARINS).
Nantes Univ. (France). Lab. de Ecotoxicologie de Milieux Aquatiques.
C. Metayer, C. Amiard-Triquet, and J. P. Baud.
Water Research WATRAG, Vol. 24, No. 8, p 995-1001, August 1990. 2 fig, 6 tab, 24 ref. English summary.

Descriptors: *Bioaccumulation, *Mollusks, *Path of pollutants, *Silver, *Toxicity, Crassostrea, Food chains, Heavy metals, Mussels, Mytilus, Oysters, Scallops, Water pollution.

Previous data about silver in marine molluscs have shown a high variability of both accumulation and toxicity of this metal. A potential relationship between these factors was examined. In a preliminary experiment, three species of bivalves (Crassostrea gigas, Mytilus galloprovincialis, Chlamys varia) were exposed to silver concentrations varying from 1 to 1000 microgram Ag/L in order to determine parameters of lethal toxicity. Then, specimens of the same species were exposed to sublethal levels of silver through food, water or both food and water. In this main experiment, the level of silver was identical (20 microgram Ag/L) in the culture medium of algae used as food and in the rearing medium of bivalves. Since the nominal levels of silver in water decreased during the experiment, seawater and contaminant were renewed every day. The species-related variations of mean lethal time revealed that the most resistant species was the oyster and the lesser one was the scallop. The patterns of bioaccumulation in soft tissues were different in oysters--in which the maximal concentration was reached within 2 weeks--and in mussels--in which this maximum was not reached after 4 weeks. Exposure to silver via food induced a significant uptake of this metal in soft tissues of bivalves, but it was low compared to uptake from seawater and to the contamination from the double method of exposure. The species-related behavior of silver may be interpreted from the point of view of ecotoxicological consequences. Species such as the oyster, with a low susceptibility and high ability to concentrate silver, could have an important role as the vector of contamination in food webs. Species such as the scallop, able to concentrate high levels of silver and very susceptible, could be eliminated from polluted ecosystems, but their role in trophic transfer will be eliminated. Species such as the mussel, which accumulate only low quantities of silver, will not have any role in food chain contamination and their intermediate susceptibility could have consequences only in highly polluted environments. (Mertz-PTT)

SEASONAL AND LONG-TERM TRENDS IN TRUCKEE RIVER NUTRIENT CONCENTRATIONS AND TRUCKEE RIVER NUTRIENT CONCENTRATIONS AND LOADINGS TO PYRAMID LAKE, NEVADA: A TERMINAL SALINE LAKE.
Fish and Wildlife Service, Columbia, MO.
D. L. Galat.
Water Research WATRAG, Vol. 24, No. 8, p 1031-1040, August 1990. 5 fig, 4 tab, 48 ref.

Descriptors: *Eutrophication, *Nevada, *Nitrogen, *Nutrient transport, *Path of pollutants, *Phosphorus, *Saline lakes, Effluents, Fluctuations, Lakes, Pollution load, Precipitation, Pyramid Lake, Rivers, Truckee River, Water pollution.

Mass-discharge of phosphorus and nitrogen from Truckee River to Pyramid Lake, Nevada, was estimated for 15 years (1973-1987) and related to changes in quantity and quality of sewage effluent discharged into the river. Effluent nitrogen loadings to Truckee River increased by about 6%/year, whereas phosphorus discharge beginning in 1982 was reduced 90% by phosphorus removal. Water discharged annually by Truckee River to Pyramid Lake varied widely among years, ranging from about 42,000,000 to 2,420,000,000 cubic meters. Anomalous regional precipitation patterns associated with strong El Nino-Southern Oscillation events resulted in below-average Truckee River discharge from 1977 to 1979, and above-average discharge from 1982 to 1984 and 1986. Mass-transport of soluble reactive phosphorus to Pyramid Lake declined from 146 to 94 mg/square m/year after phosphorus removal, whereas total phosphorus loadings increased from 217 to 396 mg/square m/year. There were no significant long-term trends in total nitrogen loadings to Pyramid Lake (mean 1640 mg/square m/year; range 112-5500 mg/square m/year), despite increases in effluent nitrogen loadings to Truckee River. Seasonal and annual fluctuations in fluvial discharge changes in quantity and quality of effluent discharged to Truckee River and in-river biological uptake and transformations were responsible for the variability in in-stream nutrient concentrations and projected loadings to Pyramid Lake. Total fluorine, chloride, bromide and total iodine concentration data from a 5 year study of rainfall, throughfall, stemflow and streamwater at the Hafren conifer plantation are presented. Results show four main features. First, in rainfall a strong maritime influence is observed for chloride and bromide, while enrichment occurs for total fluorine and total iodine relative to chloride, reflecting seawater/atmosphere fractionation processes. Second, variation of chloride, bromide and tot

iodine is much lower in the streamwaters compared with the rainfall input, showing the ability of the catchment to damp rainfall chemistry even though 'flashy' hydrograph response is observed. Total fluorine does not exhibit this damping and the reason for this difference remains unclear. Third, there is a net release of total fluorine from the catchment above that supplied from the rainfall, while net losses for bromide and total iodine occur as water passes from rainfall to the stream. Fourth, marked seasonal oscillations occur for streamwater bromide and total iodine concentrations; it is hypothesized that this relates to organic matter breakdown within the catchment during the summer period when biological activity is at its highest. Descriptors: *Algae, *Eutrophication, *Lagoons, *Marine sediments, *Path of pollutants, *Polychlorinated biphenyls, *Water pollution sources, Algal blooms, Anoxia, Biomass, Chemical analysis, Fate of pollutants, Italy, Seasonal variation, Venice.

The preliminary results of a study to investigate the role of macroalgae in the variations of polychlorinated biphenyl (PCB) concentrations in the surface sediments of the lagoon of Venice are reported. The concentrations of PCBs were determined over a period of 1 year in surface sediments sampled monthly and semi-monthly in the lagoon. At the sampling station, due to the poor water circulation and an over-abundance of nutrients, macroalgae thrive in spring-summer and standing crops > 12 kg/sq m were seen. As a consequence of rapid algal decomposition, sediment PCB concentrations were observed to increase. In particular, on occasions when anoxia occurred at the end of July and all the biomass had decayed, PCB concentrations increased by more than one order of magnitude. In March, when macroalgae started to grow, concentrations were 13 ng/g (dry wt); in July-August they exceeded 100 ng/g. The sediment PCB concentrations were restored to the previous values after algal biomass became negligible, in November. Concentrations of PCBs in young algae fronds were 27 +/-12 ng/g and 121 +/-4 ng/g in older fronds. (Author's abstract)

CHEMICAL COMPOSITION AND ACIDITY OF RAINFALL IN THE ALLIGATOR RIVERS REGION, NORTHERN TERRITORY, AUSTRALIA.
Office of the Supervising Scientist for the Alligator Rivers Region, Sydney (Australia).
B. N. Noller, N. A. Currey, G. P. Ayers, and R. W. Gillett.
Science of the Total Environment STENDL, Vol. 91, p 23-48, February 1990. 6 fig, 6 ref, 47 ref.

Descriptors: *Acid rain, *Australia, *Chemistry of precipitation, *Hydrogen ion concentration, *Path of pollutants, Acetates, Air pollution sources, Chemical analysis, Chlorides, Conductivity, Nitrates, Organic acids, Phosphates, Pollutant identification, Rainfall, Sulfates.

Rainfall in the Alligator Rivers Region, Northern Territory, is essentially restricted to the period October to April. Rainwater samples from eight sites show that pH is consistently between 4.0 and 5.0, and confirms previous observations of the widespread occurrence of acidic rainwater across the northern parts of Australia. Measurements of ions (sulfate, nitrate, chloride, phosphate) and weak organic acids (formate and acetate) in rainfall, together with pH and conductivity, have shown the presence of local concentrations of ions and presence of free acidity in excess of that attributed to dissolved carbon dioxide. Much of the acidity was associated with the presence of weak acids; for example, for all Magela samples 47% was weak acids compared with 25.5, 13 and 8% for hydrochloric, sulfuric and nitric acids, respectively. Acidity due to sulfate was therefore low, but sulfate in excess of that derived from sea-salt was of large magnitude; for example, 83% of sulfate for all Magela samples was excess. Possible sources of acidity are natural (burning of vegetation, soil dust, lightning, biogenic emissions from soils and oceans and volcanoes), and anthropogenic (sulfuric acid plant and electricity generating stations and minor emissions from calciners and sulfuric acid aerosols in open vats locally at Jabiru and nearby Nabarlek). The impact of sulfur emissions from the Ranger uranium mine/mill complex (sulfuric acid plant and electricity generating station) on rainwater acidity in the surrounding Jabiru area was examined, but the fate of the sulfur dioxide emissions was not known. Difficulties in establishing the significance of contributions from anthropogenic sources against this background of natural acidity are attributed to a lack of information on the proportions of chloride, sulfate and nitrate from these sources. High concentrations of zinc (up to 15 mg/L) were observed in most of the acid recharge groundwater in an area of 30 sq km in use as farmland and as a nature reserve in a coversand landscape at the Dutch-Belgian border. These zinc loads are assumed to be associated with atmospheric deposition from zinc smelters in the region. To explain spatial differences in the zinc content of the groundwater, soil samples were taken from organic and mineral horizons down to the groundwater table of two comparable soil profiles under Scotch pine, which had associated groundwater differing in zinc content by a factor of 40. No appreciable differences could be detected between these two soils. The total and extractable heavy metal contents (Pb, Cu, Cd, Zn) of both soils were comparable with reference situations, only the zinc contents were slightly higher than normal. The complexing capacity of the groundwater corresponding to both soil profiles was small. Longitudinal study of the zinc contents of the heavily loaded groundwater compared with chloride indicates that zinc concentrations increase disproportionately during the growing season. Few references are available on the behavior of zinc and other trace metals in groundwater. Atmospheric input of heavy metals is probably responsible for the locally high zinc concentrations in groundwater, but, to a considerable extent, lateral mobilization and immobilization processes within the phreatic reach regulate these concentrations. CHEMISTRY OF CARBONYL COMPOUNDS IN PO VALLEY FOG WATER.
Consiglio Nazionale delle Ricerche, Bologna (Italy). Ist. FISBAT.
M. C. Facchini, J. Lind, G. Orsi, and S. Fuzzi.
Science of the Total Environment STENDL, Vol. 91, p 79-86, February 1990. 1 fig, 2 tab, 22 ref.

Descriptors: *Acid rain, *Aldehydes, *Carbonyl compounds, *Chemistry of precipitation, *Fog, *Fogwater chemistry, *Path of pollutants, *Water pollution sources, Air pollution, Atmospheric water, Chemical analysis, Formaldehyde, Italy, Laboratory methods, Po Valley, Seasonal variation.

Measurements were made of the free and bound carbonyl compounds in Po Valley fog water samples. Free and then total carbonyls were determined after cleaving the possible adducts by NaOH addition. The hydroxymethansulfonic acid concentration was inferred as the difference between the two measurements, making the assumption that hydroxyalkanesulfonic acids are by far the most abundant adducts of carbonyl compounds in the atmospheric liquid samples. High concentrations of formaldehyde (HCHO) were detected in fog water (from 16 to 567 micromolar; average, 130 micromolar). The oxidant-limiting conditions during fog season (fall-winter months) favor the presence of a large fraction of HCHO in the form of adducts with hydroxymethanesulfonate: 85% of the total HCHO on average. Other carbonyl compounds were detected in the fog water: acetaldehyde, acrolein and acetone, but typically in much lower concentrations than formaldehyde. These other carbonyl compounds do not appear to be present in bound form. (Author's abstract)

GEOGRAPHICAL DISTRIBUTION OF CONTAMINANTS AND PRODUCTIVITY MEASURES OF HERRING GULLS IN THE GREAT LAKES: LAKE ERIE AND CONNECTING CHANNELS 1978/79.
Canadian Wildlife Service, Burlington (Ontario). Ontario Region.
D. V. Weseloh, P. Mineau, and J. Struger.
Science of the Total Environment STENDL, Vol. 91, p 141-159, February 1990. 3 fig, 9 tab, 36 ref.

Descriptors: *Bioaccumulation, *Bioindicators, *Great Lakes, *Gulls, *Lake Erie, *Path of pollutants, *Productivity, Chemical analysis, Chlorinated hydrocarbons, Correlation analysis, DDE, DDT, Data analysis, Dieldrin, Eggs, Fate of pollutants, Halogenated pesticides, Pesticide drift, Pesticide residues, Polychlorinated biphenyls, Water pollution effects.

The distribution and size of colonies, residue levels of DDE, DDT, hexachlorobeneze (HCB), dieldrin, mirex and polychlorinated biphenyls (PCBs) in eggs, productivity and eggshell thickness were determined for herring gulls at 14 sites in Lake Erie and connecting channels. The center of distribution for breeding herring gulls was the Western Basin where approximately 90% of the 6200 nests in the study area were located. PCB and DDE levels ranged from 35 to 140 ppm (wet weight) and from 2.8 to 9.4 ppm, respectively; all other residues were < 0.49 ppm. Most organochlorine residue levels were highest in eggs from colonies in or near the Niagra or Detroit Rivers. Mirex residues were greatest in the Niagra River and decreased significantly to the west. PCB residues were greatest in the Detroit River and decreased significantly to the east. The lowest levels generally came from colonies in the Sandusky Basin and near Pelee Island in western Lake Erie. Discriminant function analysis of six organochlorine contaminants correctly classified 90% or more of the eggs from up to four colonies in one or more years. PCB and HCB levels appeared to have the greatest discriminating power. Herring gull productivity at all colonies (1-1.7 young gulls/pair) was normal and showed no significant geographical variation. Eggshell thickness was greatest in colonies in the Sandusky Basin and least in colonies in the Detroit River and extreme west end of the lake; mean eggshell thickness was 0.350 +/-0.02 mm (6.7% thinning), which was weakly, but significantly correlated to DDE concentration. The variation in contaminants in herring gull eggs on a Basin basis (i.e. Western, Eastern, Sandusky, etc.) paralleled

LIBRARY U. OF I. URBANA-CHAMPAIGN

those known for sediments, water and fish. In addition to its role as an indicator of lake-wide contamination of the Great Lakes, the herring gull may function as an indicator of 'regional' contamination. This improves the geographical specificity of the herring gull as an indicator species on the Great Lakes, where it is a non-migratory species. (Author's abstract)

PARAFFIN HYDROCARBONS IN THE GONADS OF THE SEA URCHIN STRONGYLOCENTROTUS NUDUS NORMALLY AND AFTER EXPOSURE TO DIESEL OIL (IN RUSSIAN).
Akademiya Nauk SSSR, Vladivostok. Inst. Biologii Morya.
M. A. Vashchenko, and V. I. Svetashev.
Biologiia Moria BIMOD4, No. 5, p 61-67, 1989. 3 fig, 1 tab, 28 ref.

Descriptors: *Aliphatic hydrocarbons, *Animal tissues, *Bioaccumulation, *Echinoderms, *Oil pollution, *Path of pollutants, *Tissue analysis, Gas chromatography, Laboratory methods.

The accumulation of paraffin hydrocarbons in the gonads of the sea urchin Strongylocentrotus nudus exposed to the water soluble fraction (WSF) of light diesel oil was determined using gas chromatography. In the male and female gonads of the sea urchins from the control group (before exposure) and the experimental group (exposed to WSF of light diesel oil for 1,3,7, and 15 days) a homologous series of n-paraffins over the range of C15-C28 and C13-C28, respectively, was found. Gas chromatograms of n-alkanes isolated from the gonads of experimental animals showed a greater unresolved peak and the presence of isoalkanes in the C14-C18 range not found in controls. These isoalkanes were identical to those from WSF of diesel oil. The qualitative composition of n-paraffins over the C19-C28 range was similar for both the control and experimental sea urchins. Hydrocarbon levels in the gonads of experimental animals were 5-20 times higher than in controls. n-Alkane concentration was maximal in male gonads the day after exposure. It was concluded that the gonads of sea urchins exposed to WSF of light diesel oil accumulate hydrocarbons. (Author's abstract)

RELEASE OF CATIONIC ALUMINIUM FROM ACIDIC SOILS INTO DRAINAGE WATER AND RELATIONSHIPS WITH LAND USE.
University Coll. of Wales, Aberystwyth. Soil Science Unit.
W. A. Adams, A. Y. Ali, and P. J. Lewis.
Journal of Soil Science JSSCAH, Vol. 41, No. 2, p 255-268, June 1990. 5 fig, 10 tab, 24 ref.

Descriptors: *Acid rain, *Acidic soils, *Aluminum, *Cation exchange, *Drainage water, *Leachates, *Soil chemistry, *Solute transport, Acidic water, Cations, Chemical interactions, Hydrogen ion concentration, Ion exchange, Land use, Leaching, Nitrates, Rainfall, Stream discharge, Sulfates, Wales.

Aluminum is usually the dominant exchangeable cation in strongly acidic soils. The concentration of cationic monomeric aluminum (Al(+3)) was determined in streams draining areas of different land use in Wales. Relationships between the concentrations of Al(+3) and companion ions were examined both for streams and for eluates from soil leached in the laboratory with simulated rainwater that ranged in pH and salt concentration. The concentrations of Al(+3) were consistently greater in streams draining Sitka spruce woodland than in streams in adjacent catchments draining rough grazing. In no case was the Al(+3) concentration governed by the solubility product of gibbsite. The concentrations of Al(+3) were very closely correlated with excess anions (total inorganic anions minus basic cations) both for stream water and for eluates from soil leached with simulated rainwater at a constant pH equal to that of the soil (3.8). Exchangeable Al was the source of Al(+3) in leachates from soil in the laboratory. The displacement of exchangeable Al was the dominant process accounting for the levels of Al(+3) in acidic streams. Hydrogen ions were much more important than basic cations in displacing exchangeable Al from the acidic soil used in the laboratory experiments, and probably from soils in the field. The greater excess of inorganic anions in streams from Sitka spruce woodland probably resulted from a greater anion excess in the input water (acid rain) together with a greater NO3 production in the soil. All three major anions--Cl, SO4, and NO3--contributed to the greater anion excess. (Author's abstract)

People in Boston and surrounding communities expect their public works systems to keep pace with their needs through periodic extension, revision, rehabilitation, and repair. In the most recent project, a $35 million, four-year program, the Massachusetts Water Resources Authority completely restructured the pumping system of the North Metropolitan Sewerage System which required that the existing system serve as building blocks for the new system, which will meet the area's needs through the year 2000. Two major components of the upgraded system are the new pump station and screen house. Design and construction challenges for these components, and for the conduits and connections required to integrate them into the overall system, were compounded by site constraints and the need to keep the existing system operating throughout construction. Construction of the new pump station required a number of diversions, new conduits, and connections as well as modifications to existing facilities. The new pump station was sited near the existing station for easy connection to the two siphons and two sewers that would deliver flows to it. Junction chambers were constructed around the sewers and siphons; as each chamber was completed, the sewers were reactivated until station startup. The screen house required a number of diversions and bypasses. Again, junction chambers were constructed and flows were diverted during construction and then back to their original locations. When the system is brought on-line, its capacity of 125 mgd will meet the needs of the area for the rest of the decade. (Fish-PTT)

PIRLA PROJECT (PALEOECOLOGICAL INVESTIGATION OF RECENT LAKE ACIDIFICATION): AN INTRODUCTION TO THE SYNTHESIS OF THE PROJECT.
Indiana Univ. at Bloomington. Dept. of Biology.
D. R. Whitehead, D. F. Charles, and R. A. Goldstein.
Journal of Paleolimnology JOUPE8, Vol. 3, No. 3, p 187-194, 1990. 4 fig, 20 ref, append. Electric Power Research Institute fund RP-2174-10.

Descriptors: *Acid rain, *Lake acidification, *Lake basins, *Limnology, *North America, *Paleolimnology, Acid lakes, Adirondack Mountains, Biochemistry, Chemical properties, Cores, Florida, Geochemistry, Great Lakes, New England, Regional analysis, Research priorities.

The Paleoecological Investigation of Recent Lake Acidification PIRLA project was designed to assess the magnitude and character of the impact of acid precipitation on North American lake systems. The scenario that stimulated the project is straightforward: there is an obvious spatial pattern of acidic deposition in North America; a significant amount of acidic deposition falls on areas whose bedrock and surficial geology imbue them with high potential sensitivity to acid precipitation; and reconstruction of SO2 and NOx emissions for North America indicate a significant increase in emissions after 1900, and distinct patterns of emission density. The paleolimnological record can provide accurate and detailed information on the biogeochemical trajectories of lake systems: patterns of chemical and biological change that can be read on different scales. The regional research teams, areas to be studied, methods to be utilized, and questions to be approached were developed in intensive discussions among the collaborators in a meeting held in 1983. The areas focused upon include: Adirondack region, Northern New England, Northern Great Lakes States, and Northern Florida. The questions studied in each geographic region addressed evidence of lake acidification in this century; the magnitude, character, and timing of the response; and the relative roles of natural and anthropogenic sources of acidity. The primary message of PIRLA clearly lies in the regional summaries, which provide an interdisciplinary and integrated view of recent acidification trends in each region. The Paleoecological Investigation of Recent Lake Acidification (PIRLA) project prompted analysis of the sediment record of 12 Adirondack lakes, revealing that the 8 clearwater lakes with current pH <5.5 and alkalinity <10 microeq/l have acidified recently. The onset of this acidification occurred between 1920 and 1970. Loss of alkalinity, based on diatom assemblages, ranged from 2 to 35 microeq/L. The acidification trends are substantiated by stratigraphies of diatom, chrysophyte, chironomid, and cladoceran remains, Ca:Ti and Mn:Ti ratios, sequentially extracted forms of Al, and historical fish data. Acidification trends appear to be continuing in some lakes, despite reductions in atmospheric sulfur loading that began in the early 1970s. The primary cause of the acidification trend is clearly increased atmospheric deposition of strong acids derived from the combustion of fossil fuels. Natural processes and watershed disturbances cannot account for the changes in water chemistry that have occurred, but they may play a role. Sediment core profiles provide a clear record of increased atmospheric input of materials associated with the combustion of fossil fuels beginning in the late 1800s and early 1900s. The primary evidence for acidification occurs after that period, and the pattern of water chemistry response to

increased acid inputs is consistent with current understanding of lake-watershed acidification processes. (See W91-01498 thru W91-01502) (Author's abstract)

MOMENTARY INSTABILITY OF A SATURATED POROUS LAYER WITH A TIME-DEPENDENT TEMPERATURE DISTRIBUTION, AND THE MOST UNSTABLE DISTURBANCE.
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
T. Green.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2015-2021, September 1990. 7 fig, 13 ref.

Descriptors: *Convection, *Groundwater movement, *Groundwater pollution, *Path of pollutants, Mathematical analysis, Porous media, Temperature gradient.

The stability of fluid with a time-dependent vertical temperature distribution in a horizontal, saturated porous layer is investigated, using the idea of momentary stability and a Galerkin technique. The most unstable disturbance is found by minimizing the critical Rayleigh number over the Fourier amplitudes of that disturbance, using both an iterative and a simplex procedure. As an example, the case in which an originally linear, stable temperature distribution is changed by lowering the temperature of the upper boundary at a constant rate is examined in detail. It showed that the most unstable disturbance is usually large where the base state is gravitationally unstable but there seems to be no simple relation between the two. (Peters-PTT)

SOLUTE TRANSPORT WITH MULTISEGMENT, EQUILIBRIUM-CONTROLLED REACTIONS: A FEED FORWARD SIMULATION METHOD.
Geological Survey, Menlo Park, CA. Water Resources Div.
J. Rubin.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2029-2055, September 1990. 8 fig, 12 tab, 22 ref, append.

Descriptors: *Feed forward method, *Geochemistry, *Mathematical analysis, *Path of pollutants, *Solute transport, *Water chemistry, Chemical reactions, Computer models.

The feed forward method (FF method) is used to formulate operational equations which simulate transport of solutes influenced by equilibrium-controlled reaction networks. The FF method provides increased solution efficiency by adapting its formulations to some of the network's fundamental features. The FF method has been further developed by adapting and testing it for a variety of network conditions. Classes of homogeneous, classical heterogeneous, and ion exchange network segments were studied. Networks may contain only a single class of segments or they may involve two or three segment classes. The FF method was found to be applicable to all the cases tested. In only one of these cases, for the more complex configurations of network segments, the FF method did not attain all of its objectives. A systematic, stepwise approach to method development was used. It revealed, for certain subnetworks, an a priori inadmissibility, irrespective of the method used, and, for some other networks, an a priori irrelevance to transport dynamics. It also demonstrates that when certain subnetworks, belonging to different segment classes, form a single network, synergism (or antagonism) may occasionally arise and decrease (or increase) the difficulty of solving the transport problem. MASS ARRIVAL OF SORPTIVE SOLUTE IN HETEROGENEOUS POROUS MEDIA.
Royal Inst. of Tech., Stockholm (Sweden).
V. D. Cvetkovic, and A. M. Shapiro.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2057-2067, September 1990. 5 fig, 23 ref.

Descriptors: *Groundwater movement, *Mathematical analysis, *Path of pollutants, *Porous media, *Solute transport, *Water chemistry, Desorption, Hydraulic conductivity, Solutes, Sorption, Tracer studies.

The stochastic arrival time analysis of nonreactive solute movement in heterogeneous porous media was extended to consider solutes that undergo sorption-desorption governed by first-order linear kinetics. For an instantaneous solute injection, a general expression for the expected mass flux at any distance from the injection point was derived in terms of the three-dimensional velocity field and the forward-sorption and reverse-sorption rate coefficients. This general expression is reduced for three special cases: (1) equilibrium sorption-desorption where the retardation coefficient is either correlated or uncorrelated with the hydraulic conductivity field, (2) solute degradation where the rate coefficient is uncorrelated with the hydraulic conductivity, and (3) nonequilibrium sorption-desorption with constant sorption rate coefficients. These cases were analyzed for a lognormally distributed and statistically isotropic spatial correlation of the hydraulic conductivity; other assumptions of spatial correlation in the hydraulic conductivity can also be used. The influence of spatial variability in the sorption rate coefficients for nonequilibrium sorption-desorption was investigated for the special case of a stratified porous medium. For equilibrium sorption-desorption, the spatial variability in the retardation coefficient may notably delay the breakthrough of solute at a given location. The spatial variability in the degradation parameter does not influence solute breakthrough significantly for the considered range of parameters. For a stratified porous medium, spatial variability in the sorption rate coefficients has a significant effect on the cumulative mass arrival at a given location. Using the harmonic mean of the sorption rate coefficients most closely approximates the results generated using variable sorption-rate coefficients for the stratified formation case. MEAN SQUARE ERROR OF REGRESSION-BASED CONSTITUENT TRANSPORT ESTIMATES.
Geological Survey, Reston, VA.
E. J. Gilroy, R. M. Hirsch, and T. A. Cohn.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2069-2077, September 1990. 9 fig, 12 ref, append.

Descriptors: *Model studies, *Network design, *Path of pollutants, *Regression analysis, *Sampling, *Solute transport, Errors, Flow equations, Mathematical models, Surface water.

Estimates of long-term transport of constituents commonly are obtained by summing retransformed estimates from regressions of logarithmically transformed response variables. Typical explanatory variables for these regressions include functions of flow, change in flow, time, and time of year. The mean and mean square error of four estimators of long-term transport at periodically measured stations are presented as a function of the observed values of the explanatory variables from the long-term record and summary statistics of the regression data. Estimates of the mean square errors can be used in designing sampling strategies to attempt to minimize the uncertainty in the estimation of long-term transport subject to a constraint on the number of samples to be taken. This uncertainty is expressed in terms of the explanatory variables in the long-term record, the regression coefficients and standard error of the regression and the mean and covariance structure of the explanatory variables used in the regression. Descriptors: *Agricultural runoff, *Model studies, *Nonpoint pollution sources, *Path of pollutants, *Rainfall-runoff relationships, *Soil solution, *Water pollution sources, Agricultural chemicals, Hydrographs, Infiltration, Infiltration rate, Mathematical models, Overland flow, Pesticides, Soil water, Solute transport.

A model was developed to predict the field outlet concentration hydrograph for chemicals released into overland runoff induced by continuous rainfall on a sloping soil. The model accounts for convective-dispersive solute transport in the soil and also considers rate-limited mass transfer through a laminar boundary layer at the soil surface/runoff water interface. Solutes are assumed to be subject to linear equilibrium sorption onto the solid phase of the soil. Concentration hydrographs for rainfall-induced runoff were derived by treating the runoff zone as a well-mixed reactor characterized by an appropriate residence time distribution. The model was used to predict previously obtained experimental data for runoff from soil boxes with permeable bottoms. Good agreement was obtained between predicted and measured outflow concentrations for relatively low infiltration rates, provided relatively large dispersion coefficients were used in the calculations. Solute concentrations in the soil were also predicted well. Results for relatively high infiltration rates were less accurate, perhaps in part because of an incorrect assumption in the model that the infiltration rate remained constant in time and space during the runoff experiments. EVALUATING GROUND-WATER VULNERABILITY TO PESTICIDES.
Woodward-Clyde Consultants, Oakland, CA.
Y. J. Meeks, and J. D. Dean.
Journal of Water Resources Planning and Management (ASCE) JWRMD5, Vol. 116, No. 5, p 693-707, September/October 1990. 4 fig, 2 tab, 15 ref.

Descriptors: *Agricultural engineering, *Groundwater management, *Groundwater pollution, *Path of pollutants, *Pesticides, *Water resources management, Advection, California, Dispersion, Hydrologic properties, Leaching, Recharge, Solute transport, Wells.

A methodology was developed to rank the relative vulnerability of groundwater areas to contamination by agriculturally-applied pesticides. The method uses the advection-dispersion equation for chemical transport in soils to develop the leaching potential index (LPI), which is an indicator of the relative susceptibility of each area. The index incorporates the effects of depth to groundwater, natural and irrigation recharge rates, absorption, and chemical decay. The importance (weighting) of the hydrological factors is physically-based, not subjective as it is in a number of approaches reviewed. The weights are not required to have constant values, as is typical of other methodologies; they are instead dependent on the specific chemical properties of the pesticide under consideration. This methodology was verified by comparing the LPI scores estimated for a 381-sq mi (987-sq km) area located in the San Joaquin Valley, California, with available data on 1,2-dibromochloropropane (DBCP) contamination in groundwater in the same area. The percentage of wells in which DBCP was detected in these square-mile sections was positively correlated with the computed LPI scores for each section, i.e., sections having higher LPI scores tended to have wells with more frequent positive detections of DBCP. This is the first time that such a large-scale verification of similar ranking procedures has been demonstrated, and it will be a useful planning tool for early identification of agricultural areas susceptible to groundwater contamination and efficient management of sampling resources. STUDY OF POLLUTANT DIFFUSION IN THE JIUJIANG SEGMENT OF THE CHANGJIANG RIVER (IN CHINESE).
Academia Sinica, Qingdao (China). Inst. of Oceanology.
P. Q. Li, L. T. Miao, D. Y. Xia, and X. Y. Wang.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 21, No. 2, p 144-153, March 1990. 8 fig, 5 tab, 5 ref. English summary.

Descriptors: *China, *Diffusion, *Path of pollutants, *Tracers, *Yangtze River, Changjiang River, Diffusion coefficient, Dye releases, Jiujiang, Marine pollution, Surveys, Water quality.

Diffusion in the Changjiang river (Yangtze river) was studied using the fluorescent dye Rhodamine-B as a tracer and a fluorimeter developed by the authors. The results of this study indicated: 1) The Jiujiang port and the region downstream is a straight segment of river and the mean velocity of the water is about 0.5 m/s. The scale of diffusion for 6 kg of Rhodamine-B is 3240 m. 2) The diffusion of a pollutant is rapid even when the winds are moderate, and the dilution factor (DF) varies from one hundred to ten billion within 40 minutes. When there is a strong breeze or the water is disturbed by shipping, the diffusion rate of the pollutant is higher. A six to seven order magnitude of change can occur in about ten minutes after the pollutant is discharged. The pollutant is soon diluted below the level required for good water quality and serious pollution does not occur when minor pollutants are discharged. 3) The log of the concentration of Rhodamine-B is equal to a constant minus 2.9 times the log of the time, so the log of concentration is linear with the log of time and the concentration decreases rapidly. 4) The diffusion coefficient of the river water is 1.23 square m/s in the Jiujiang region. The results show that the diffusion rate of the river is generally more rapid than diffusion in the sea, and the diffusion rate is increased by the disturbance of shipping. However, this increase in the diffusion coefficient is not typical of fresh water in the Jiujiang region. 5) A gradient exists for the water current in the Jiujiang segment of the river which causes an eddy current and enhances exchange between surface and bottom water. The distribution of pollutants into the deeper waters of the river is accelerated by this eddy. Therefore a soluble pollutant can reach the drinking water intake for Jiujiang within five minutes, so the discharge of pollutants from the foreign trade area of the port must be limited. Descriptors: *Bioaccumulation, *Bioindicators, *China, *Heavy metals, *Marsh plants, *Path of pollutants, Amino acids, Cadmium, Dianchi Lake, Lead, Organic pollutants, Proteins.

The accumulation of heavy metals (Cu, Cd, Hg, and As) by Eichhornia crassipes (Mart.) Solms in the water of Dianchi Lake in Kunming and the variation of the protein and amino acid content were studied. The analytical results of the experiment indicate that Eichhornia crassipes (Mart.) Solms has a good accumulative coefficient for heavy metals. The highest concentration factors were 16,190 for Pb and 14,285 for Cd. The analysis of different parts of the plant showed that the accumulation in the root system is several times higher than the accumulation in the stems and leaves. This may result from the fact that the fibrous root system with its high contact area with water has high absorption capacity, and at the same time microbes adhering to the root system increase the accumulation. The content of protein and amino acids are relatively low in Eichhornia crassipes (Mart.) Solms growing in the water with higher levels of heavy metals. The content of protein in Eichhornia crassipes (Mart.) Solms is 38.35%, the content of amino acids 32%. There are 16 kinds of amino acids in Eichhornia crassipes (Mart.) Solms, not including tryptophan, crysteine and cystine which were not determined. Eichhornia can not only purify sewage, but can also serve as good forage and raw material for paper making as well as bio-energy. In utilizatiing Eichhornia for forage, the concentration of heavy metals and organic pollutants found in the Eichhornia crassipes (Mart.) Solms must be considered. (Author's abstract)

SEASONAL VARIATION OF THERMOPHILIC CAMPYLOBACTERS IN SEWAGE SLUDGE.
Lancaster Univ. (England). Dept. of Biological Sciences.
K. Jones, M. Betaieb, and D. R. Telford.
Journal of Applied Bacteriology JABAA4, Vol. 69, No. 2, p 185-189, August 1990. 1 fig, 3 tab, 12 ref.

Descriptors: *Bacteria, *Bacterial analysis, *Campylobacter, *Digested sludge, *Microorganisms, *Pathogenic bacteria, *Seasonal variation, *Sludge, *Sludge analysis, England, Fate of pollutants, Monitoring, Sludge disposal, Sludge utilization, Wastewater, Wastewater treatment.

The seasonal variation of thermophilic campylobacters in sewage sludge was studied over a 21 month period. The numbers in fresh sludge (from primary sedimentation) vary between approximately 200 and 5000/100 ml for most of the year but there was a large increase in May and June (in May 1988 there were 42,100 campylobacters/100 ml which is 17 times more than in the preceding April). In 1989 there was a similar May/June peak but with lower numbers. This seasonal variation, measured by environmental monitoring, reflects the incidence of infections in the community. The same pattern was found in 2-d old sludge but the numbers were substantially lower (40% lower over the experimental period). Thermophilic campylobacters were virtually absent from digested sludge and sludge prior to land distribution. Survival experiments confirm that campylobacters survive for only a few hours in both sterile and unsterile digested and undigested sludge. These results suggest that it is safe to dispose of Lancaster's digested sludge on land but there is still uncertainty about the ability of campylobacters to survive in sludge in the viable but non-culturable form. EFFECTS OF SUNLIGHT AND AUTOCHTHONOUS MICROBIOTA ON ESCHERICHIA COLI SURVIVAL IN AN ESTUARINE ENVIRONMENT.
Virginia Inst. of Marine Science, Gloucester Point. Dept. of Biological and Fisheries Sciences
M.W. Rhodes, and H. I. Kator.
Current Microbiology CUMIDD, Vol. 21, No. 1, p 65-73, July 1990. 5 fig, 4 tab, 52 ref. NOAA Grant No. NA81AA-D-00025.

Descriptors: *Chesapeake Bay, *Enteric bacteria, *Escherichia coli, *Estuaries, *Fate of pollutants,

Cell mortality, Microbiological studies, Ultraviolet radiation.

The effects of sunlight and the indigenous microbiota on Escherichia coli survival were examined with membrane diffusion chambers deployed in Chesapeake Bay shellfish growing waters. Chambers, fitted with an 'upper' UV and visible light-transmitting copolymer film and 'lower' semipermeable polycarbonate membrane, were deployed parallel to the water surface to maximize light exposure. Maximum values of a coefficient describing changes in culturable cell densities after exposure to sunlight, were 1.7/h and 0.7/h in preliminary tank and in situ experiments, respectively. Mortality and sublethal stress, the latter measured with an electrochemical detection technique, were largest during the first 4 h of exposure. Owing to the light-attenuating properties of Chesapeake Bay water, light-induced cell mortality was significantly reduced at 0.25 m compared with surface exposed cells, and was undetected at 0.5-1.0 m except during seasons of maximal light penetration. Combined exposure to both sunlight and the autochthonous microbiota yielded significantly greater mortality than for either factor alone. (Author's abstract)

COMPARISON OF A GENE PROBE WITH CLASSICAL METHODS FOR DETECTING 2,4-DICHLOROPHENOXYACETIC ACID (2,4-D)-BIODEGRADING BACTERIA IN NATURAL WATERS.
Oregon State Univ., Corvallis. Dept. of Microbiology.
P. S. Amy, M. V. Staudaher, and R. J. Seidler.
Current Microbiology CUMIDD, Vol. 21, No. 2, p 95-101, August 1990. 4 fig, 3 tab, 19 ref.

Descriptors: *Biodegradation, *Experimental data, *Fate of pollutants, *Herbicides, *Pesticides, Colony hybridization, Gene probes, Marys River, Willamette River.

Colony hybridizations with a gene probe for enumeration of bacteria the herbicide 2,4-dichlorophenoxyacetic acid (2,4-D) were compared with classical enrichment and radiolabel most-probable-number (MPN) assay methods. UV scans of enrichment cultures revealed 2,4-D degradation with raw sewage occurred in 4-11 days, 4->22 days with Mary's River water, and 5->22 days with Willamette River water. 14C-2,4-D MPN analysis, measuring release of 14CO2, yielded estimates of bacteria per milliliter able to degrade 2,4-D. Raw sewage estimates were 140,000 2,4-D degraders/ml, Mary's River water > 160,000/ml, and Willamette River water 16,000/ml. Activities noted by UV scan enrichment data supported these results. Autoradiograms of colony blots were also used to estimate numbers of 2,4-D-degrading bacteria. These estimates were also supported by the UV scan data from enrichment cultures. Raw sewage counts between 50,000 and 290,000 2,4-D-degrading bacteria/ml, which correlates well with the estimates obtained by 14C-MPN analyses. River waters, both much lower in total bacteria counts and organic carbon than raw sewage, yielded fewer 2,4-D-degrading bacteria than estimated by 14C-MPN. Media composition and cometabolism may account for discrepancies in estimates for 2,4-D-degrading bacteria observed when colony blot and 14C-MPN analyses were compared. Replica plating made it possible to test for 2,4-D biodegradation from colonies reactive in autoradiograms. Five of 12 colonies reacting in the colony hybridization exhibited biodegradation activities. Nonreactive colonies failed to degrade 2,4-D. (Author's abstract)

NITRATES IN GROUND WATER.
S. Chakravarty.
Water Resources Journal, No. 163, p 109-110, December 1989. 1 fig, 6 ref.

Descriptors: *Groundwater pollution, *India, *Nitrates, *Nitrogen removal, *Nonpoint pollution sources, *Water pollution control, *Water pollution treatment, Agricultural chemicals, Agriculture, Biodegradation, Desalination, Dissolved solids, Fertilizers, Membrane processes.

A newly emerging problem in the field of groundwater quality is excessive nitrates arising from increased use of nitrogen fertilizers. A recent survey in India revealed that 1,290 groundwater samples from 11 States had a nitrate content more than 45 mg/L. Most were also found to have a high dissolved solids content. The standard technologies applied for desalination such as reverse osmosis and electrodialysis can also achieve the removal of nitrates. Natural decomposition of nitrates by bacteria can be successfully applied. In many cases, a combination of instantly implemented hydrological measures and agricultural measures adapted to local conditions would be the most suitable way to solve the problem of nitrate load. Close collaboration between the water supplying and agricultural sectors within the affected catchment areas is necessary. (Miller-PTT)

CAUSES OF TEMPORAL VARIABILITY OF LEAD IN DOMESTIC PLUMBING SYSTEMS.
Illinois State Water Survey Div., Champaign. Aquatic Chemistry Section.
M. R. Schock.
Environmental Monitoring and Assessment EMASDH, Vol. 15, No. 1, p 59-82, July 1990. 8 fig, 6 tab, 38 ref. EPA Contracts 7W-7480-NASA and 7W-7425-NASX.

Descriptors: *Lead, *Pipelines, *Statistical analysis, *Temporal variation, *Water pollution sources, Brass, Carbonates, Chlorine, Hydrogen ion concentration, Orthophosphates, Silicates, Solder, Water conveyance.

Sources of lead in drinking water are primarily lead pipe, lead/tin solder, and brass fixture materials. Lead levels in the water depend upon many solubility factors, such as: water pH, concentrations of substances such as inorganic carbonate, orthophosphate, chlorine, and silicate; temperature; and the nature of the pipe surface. Physical factors such as time and chemical mass transfer are also significant in governing lead levels in non-equilibrium systems. Analytical variability is not particularly significant relative to between-site and within-site variability. Knowledge of temporal variability at each site is necessary to define a statistically valid monitoring program. An analysis of published data covering repetitive measurements at a given site show that the variability of lead concentration at each site tends to be characterized by the frequent occurrence of spikes. Variability expressed as approximate relative standard deviations tend to be about 50-75% in untreated water, regardless of the mean lead concentration. The distributions are frequently not normal for small numbers of samples. Monitoring programs must incorporate controls for the causes of the within-site and between-site variability into their sampling design. The determination of necessary sampling frequency, sample number and sample volume must be made with consideration of the system variability, or the results will be unrepresentative and irreproducible. TRIAZINE HERBICIDE FATE IN A NO-TILLAGE CORN (ZEA MAYS L.)-CROWNVETCH (CORONILLA VARIA L.) 'LIVING MULCH' SYSTEM.
Pennsylvania State Univ., University Park. Dept. of Agronomy.
J. K. Hall, and N. L. Hartwig.
Agriculture, Ecosystems and Environment AEENDO, Vol. 30, No. 3/4, p 281-293, April 1990. 2 fig, 28 ref.

Descriptors: *Crownvetch, *Herbicides, *Maize, *Mulches, *Path of pollutants, *Soil contamination, *Triazine herbicides, Agriculture, Clay loam, Leaching, Pollutant identification, Soil analysis, Soil types.

Chloro-s-triazine herbicide distribution, dissipation and leaching potential were examined in two untilled soils planted to corn (Zea mays L.) in a crownvetch (Coronilla varia L.) 'living mulch' sod. Herbicides studied were simazine (6-chloro-N,N'-diethyl-1,3,5-triazine-2,4-diamine), atrazine, cyanazine and procyazine. Each was applied at 2.2 and 4.5 kg (active ingredient) /ha. Soil profiles were sampled twice yearly in 15 cm increments to 91 or 122 cm deep. These soil fractions were analyzed for parent herbicide residues. Herbicide dissipation and translocation were rapid and extensive under no-tillage management, and herbicide distribution in the different soil profiles was not predictable solely on the basis of water solubility of the chemicals or soil texture. The probability of detecting subsoil levels of these herbicides was as great in the Murrill silty clay loam as in the Morrison sandy loam tested. Simazine and atrazine were more persistent and detected more frequently at lower profile depths than cyanazine and procyazine, which are considerably more water soluble. Redistribution of simazine and atrazine by leaching from early to mid-season was also more evident in each soil. (Author's abstract)

EXAMINATION OF THE RANGE OF COPPER COMPLEXING LIGANDS IN NATURAL WATERS USING A COMBINATION OF CATHODIC STRIPPING VOLTAMMETRY AND COMPUTER SIMULATION.
Water Research Centre, Medmenham (England). Medmenham Lab.
S. C. Apte, M. J. Gardner, J. E. Ravenscroft, and J. A. Turrell.
Analytica Chimica Acta ACACAM, Vol. 235, No. 2, p 287-297, August 15, 1990. 4 fig, 3 tab, 17 ref.

Descriptors: *Chemical analysis, *Copper compounds, *England, *Estuaries, *Heavy metals, *Pollutant identification, *Voltammetry, *Water analysis, Analytical methods, Metal complexes, Organic compounds, Salinity, Water quality control.

Knowledge of the detection capabilities of speciation techniques, gained by calculation and computer simulation, can be combined with experimental measurements to arrive at an understanding of trace metal speciation which is less dependent on operational factors than other approaches. Surface-water samples were collected from the Humber Estuary and its tributaries in two surveys carried out in November 1988 and October 1989. Some supplementary river samples were also taken in February 1990. The sampling sites were chosen primarily to obtain information on freshwater inputs and to obtain a broad range of estuarine salinities. Although concentrations of total dissolved copper can approach the estuarine Environmental Quality Standard value of 5 microgram/L, there is evidence of a substantial excess of complexing ligands at all locations except the outer estuary, where copper levels are much reduced by dilution. Dissolved copper is therefore present almost totally in the form of organic complexes. The range of different types of ligand is also assessed. In sea water there appears to be a range of ligands of differing affinities for copper; the complexing capacity ranges form 20 nM (conditional stability complex of the copper complex (K') > 10 raised to the fourteenth power) to 70 nM (K' > 10 raised to the eighth power). For estuarine samples, ligands with a high affinity for copper seem to be predominant and the overall complexing capacity rises to over 200 nM. In freshwater samples, it is likely that the potential for varying combinations of weak and strong complexes will depend on the

water quality, but a capacity to complex over 200 nM copper is not unusual. (Author's abstract)

ROLE OF AMMONIUM AND NITRATE RETENTION IN THE ACIDIFICATION OF LAKES AND FORESTED CATCHMENTS.
Ontario Ministry of the Environment, Dorchester. Dorset Research Center.
P. J. Dillon, and L. A. Molot.
Biogeochemistry BIOGEP, Vol. 11, No. 1, p 23-43, September 1990. 6 fig, 8 tab, 57 ref.

Descriptors: *Acid rain, *Acidification, *Ammonium, *Chemistry of precipitation, *Forest watersheds, *Lakes, *Nitrates, Ecosystems, Freshwater, Nitrogen, Path of pollutants, Streams, Surface water.

The relative contribution of HNO3 to precipitation acidity in Eastern Canada has increased in recent years leading to some concern that the relative importance of NO3(-) deposition in acidification of terrestrial and aquatic ecosystems may increase. To gage the extent of this impact, annual mass balances for NO3(-) and NH4(+) were calculated for several forested catchments and lakes in Ontario. Retention of NH4(+) by forested catchments was consistently high compared to retention of NO3(-) which was highly variable. Retention of inorganic nitrogen was influenced by catchment grade and areal water discharge. In lakes, the reciprocals of retention of NO3(-) and NH4(+) were linearly related to the ratio of lake mean depth to water residence time and retention time did not appear to be a function of degree of acidification of the lakes. Net N consumption-based acidification of lakes, defined as the ratio of annual NH4(+) mass to NO3(-) mass consumption, was negatively correlated with the areal water discharge and N consumption-related acidification was most likely to occur when the areal water discharge was <1.5 m/yr. If retention mechanisms are unaffected by changes in deposition, changes in deposition will still result in changes in surface water concentrations although the changes will be of similar proportions. Therefore, 'NO3(-) saturation' should not be defined by concentrations alone, but should be defined as decreasing long-term, average NO3(-) retention in streams and lakes in response to long-term increases in NO3(-) deposition. Analysis of survey data will be facilitated by grouping lakes and catchments according to similar characteristics. (Author's abstract)

METHANE EMISSIONS FROM FEN, BOG AND SWAMP PEATLANDS IN QUEBEC.
McGill Univ., Montreal (Quebec). Dept. of Geography.
T. R. Moore, and R. Knowles.
Biogeochemistry BIOGEP, Vol. 11, No. 1, p 45-61, September 1990. 4 fig, 5 tab, 40 ref.

Descriptors: *Air pollution sources, *Bogs, *Fens, *Global warming, *Limnology, *Methane, *Methanogenesis, *Quebec, *Swamps, *Wetlands, Aerobic conditions, Anaerobic conditions, Climatic zones, Peat, Seasonal variation, Topography.

A static chamber technique was used weekly from spring thaw to winter freezing to measure methane emissions from ten sites representing subarctic fens and temperate swamps and bogs. Rates of <200 mgCH4/ sq m d were recorded in subarctic fens: within-site emissions were primarily controlled by the evolution of the peat thermal regime, though significant releases during spring thaw were recorded at some sites. Between subarctic fens, topography and water table elevation were important controls on methane emissions, with the general sequence: pool = horizontal fen > string. Emission rates from the two swamp sites were lower (<20 mg CH4/sq m/d), except during the spring thaw and when the sites were saturated. The low water table (<80 cm depth) in abnormally dry years reduced emission rates; rates were also low from a swamp site which had been drained and cleared of vegetation for horticulture. Methane emission rates were also low (< 5 mg CH4/sq m/d) from 2 ombrotrophic bog sites. Laboratory measurements of rates of methane production under anaerobic conditions and methane consumption under aerobic conditions revealed that production rates were generally highest in the surface layers (0 to 25 cm depth); production was high in the fens and very low in the bogs. The swamp samples were able to produce methane under anaerobic conditions, but were also able to consume methane under aerobic conditions. Annual methane emission rates are estimated to be 1 to 10 g CH4/sq m from the fens, 1 to 4 g CH4/sq m from the swamps and <0.2 g CH4/sq m from the bogs and drained swamp. (Author's abstract)
W91-01719

FATE OF CATIONIC SURFACTANTS IN THE MARINE ENVIRONMENT: I. BIOCONCENTRATION OF LONG-CHAIN ALKYLNITRILES AND TRIALKYLAMINES.
Centro de Investigacion y Desarrollo, Barcelona (Spain). Dept. of Environmental Chemistry.
M. Valls, P. Fernandez, and J. M. Bayona.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1819-1827, 1989. 5 fig, 1 tab, 21 ref.

Descriptors: *Alkylnitriles, *Bioaccumulation, *Biological magnification, *Cationic surfactants, *Path of pollutants, *Spain, *Surfactants, *Trialkylamines, Analytical methods, Fate of pollutants, Industrial wastes, Pollutant identification, Polycyclic aromatic hydrocarbons, Sediment analysis, Toxicology.

The occurrence of cationic surfactants in the environment, which account for 10% of the total industrial output, has not been addressed until very recently. It is proposed that the long-chain alkylamines (TAMs) be used as conservative tracers of this class of surfactants because they have been found widely distributed in the aquatic environment but their ecotoxicological implications still remain unknown. The bioconcentration of the (TAMS) and long-chain alkylnitriles (LANs), both of which are present as impurities in surfactant formulations, were assessed. Water, benthic and pelagic biota and sediment samples were collected in coastal areas off Barcelona, Spain, near the mouth of the Besas River, near a dumping site, and examined for the tracers. Long-chain alkylnitriles (LANs) and TAMs were identified for the first time in biota samples at concentrations ranging from 9 to 574 ng/g and from 157 to 825 ng/g (fresh weight basis), respectively. In addition, the simultaneous occurrence in the aquatic environment of LANs and TAMs were also reported for the first time. The bioconcentratio factor values of both LANs and TAMs varied according to the different species but they were comparable to those found for polycyclic aromatic hydrocarbons. OBSERVATIONS ON OVERWINTERING JUVENILE CHINOOK SALMON (ONCORHYNCHUS TSHAWYTSCHA) EXPOSED TO BLEACHED KRAFT MILL EFFLUENT IN THE UPPER FRASER RIVER, BRITISH COLUMBIA.
Department of Fisheries and Oceans, Vancouver (British Columbia). West Vancouver Lab.
I. H. Rogers, C. D. Levings, W. L. Lockhart, and R. J. Norstrom.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1853-1868, 1989. 3 fig, 6 tab, 33 ref.

Descriptors: *Bioaccumulation, *British Columbia, *Effluents, *Fish physiology, *Industrial wastes, *Path of pollutants, *Pulp and paper industry, *Salmon, Chlorinated hydrocarbons, Ecology, Fish, Freshwater, Rivers, Toxicology.

Chlorophenols and chloroguaiacols were quantified in juvenile chinook salmon captured near bleached kraft mills in the upper Fraser River in December 1987. Fish captured in April 1988 showed up to 55-fold induction of hepatic mixed function oxidase activity (EROD), and were contaminated with up to 370 ng/kg of 2,3,7,8-trichlorinated dibenzofuran (TCDF) and 68 ng/kg of 2,3,7,8-trichlorinated dibenzodioxin (TCDD). It is concluded that juvenile chinook salmon that spend the winter near the pulp mill outfalls in the Upper Fraser River exhibit a strong biochemical response to unidentified inducing compounds in the bleached kraft mill effluent. In addition to 2,3,7,8-TCDD and 2,3,7,8-TCDF, they also accumulate other organic residues. The ecological consequences for these fish are uncertain and further studies are in progress to explore the ensuing stages of the lifecycle until the fish have successfully adapted to salt water. (Agostine-PTT)
W91-01724

POLYCHLORINATED DIBENZOFURAN (PCDF) AND DIBENZO-P-DIOXIN (PCDD) LEVELS IN ORGANISMS AND SEDIMENTS FROM THE FRIERFJORD, SOUTHERN NORWAY.
Norsk Inst. for Vannforskning, Oslo.
J. Knutzen, and M. Oehme.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1897-1909, 1989. 5 fig, 2 tab, 30 ref.

Descriptors: *Dioxins, *Fjords, *Norway, *Polychlorinated biphenyls, *Sediment contamination, *Water pollution sources, Coasts, Crustaceans, Fish, Industrial wastes, Magnesium, Mussels, Pollutant identification, Sediment analysis, Water pollution.

The contamination of a fjord region by dibenzo-p-dioxins (PCDD) polychlorinated dibenzofuran (PCDF) produced from a Mg-production plant has been studied. Levels in organisms (fish, crustacea, mussels) and sediments were determined. The results were used to estimate the spreading of PCDD/PCDF by coastal currents. The present situation is compared with available information from other contaminated areas and with data for hexachlorobenzene and octachlorostyrene. Compared to data from less contaminated sites, initial results from the sediment studies had 2,3,7,8-TCDD equivalent concentrations that were three orders of magnitude higher. For the characteristic 2,3,7,8-substituted hexachlorodibenzofurans (HxCDFs) of the Mg plant effluent the figures are even higher. The same is valid for PCDD/PCDFs when compared to the content of surface sediments from a lake locality solely contaminated from the atmosphere. Compared to the highest levels reported elsewhere, the Frierfjord sediments contained 50-200 times higher TCDD equivalent levels. (Agostine-PTT)

ASSOCIATION OF BENZO(A)PYRENE WITH DISSOLVED ORGANIC MATTER: PREDICTION OF K(DOM) FROM STRUCTURAL AND CHEMICAL PROPERTIES OF THE ORGANIC MATTER.
Oak Ridge National Lab., TN. Environmental Sciences Div.
J. F. McCarthy, L. E. Roberson, and L. W. Burrus.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1911-1920, 1989. 1 fig, 2 tab, 28 ref. Department of Energy Contract DE-AC05-84OR21400.

Descriptors: *Benzopyrene, *Chemical properties, *Dissolved solids, *Organic matter, *Path of pollutants, *Structural behavior, Groundwater, Humic acids, Pollutant identification, Statistical analysis, Surface water.

The affinity of dissolved organic matter (DOM) for binding a polycyclic aromatic hydrocarbon, benzo(a)pyrene (BaP), was measured for 11 surface and groundwaters and a commercial humic acid. The hydrophobic-acid (HbA) and hydrophobic-neutral (HbN) compositions of the DOM, solution absorptivity at 270 nm (ABS-270), and DOM molar volumes were determined. Waters enriched in HbA material had a larger molar volume and higher aromatic content (as indicated by the ABS-270). There was a good correlation between the size and HbA content of the DOM from the different sources and the Kdom for binding BaP. An excellent predictive relationship was demonstrated between the ABS-270 of a water and the dissolved organic matter partition coefficient (Kdom) for

binding BaP. Based on these results, it is suggested that binding of a BaP to DOM depends not only on the hydrophobicity of DOM, but also on the existence of an open structure within the DOM to provide access of the aqueous solute to hydrophobic domains within the DOM. (Author's abstract)

RATE OF DEGRADATION OF 1,1,1-TRICHLOROETHANE IN WATER BY HYDROLYSIS AND DEHYDROCHLORINATION.
Solvay and Cie S.A., Brussels (Belgium). Central Lab.
R. R. Gerkins, and J. A. Franklin.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1929-1937, 1989. 1 fig, 3 tab, 14 ref.

Descriptors: *Chlorinated hydrocarbons, *Dehalogenation, *Fate of pollutants, *Hydrolysis, *Trichloroethane, Degradation, Dehydrochlorination, Kinetics, Oxidation, Rate constants, Sinks.

It is generally assumed that the only significant tropospheric sink for 1,1,1-trichloroethane is gas-phase oxidation initiated by reactions of its C-H bonds with naturally occurring hydroxyl radicals. This assumption is also the basis for calculating globally averaged tropospheric hydroxyl radical concentrations, from the known rate constant for the reaction of hydroxyl radical with 1,1,1-trichloroethane and data on emission rates and tropospheric concentrations of the latter. Degradation of 1,1,1-trichloroethane in water by hydrolysis and dehydrochlorination may conceivably be a significant sink for this compound in the environment. The kinetics of these reactions have been investigated in initially neutral water (becoming acid as the reaction proceeded), over a wide range of temperature (25 to 120 C). The experimental results were consistent with a mechanism in which hydrolysis and dehydrochlorination reactions occur in parallel, according to first-order kinetics with respect to 1,1,1-trichloroethane. It was concluded that : (1) the reaction occurred solely in the aqueous phase; (2) 1,1-dichloroethylene is not an intermediate in the hydrolysis of 1,1,1-trichloroethane to acetic acid. It was found that the activation energies of the hydrolysis and dehydrochlorination reactions are very close. According to the results, hydrolysis is roughly 2.7 times faster than dehydrochlorination at 25 C, i.e. 1,1-dichloroethylene formation represents about 27% of the overall process. The half-lives of 1,1,1-trichloroethane in water at various temperatures, calculated from the rate constants are compared with values reported in the literature. The half-life at 20 C is found to be 4.7 years. (Agostine-PTT)

SIMPLE METHOD FOR ESTIMATING DERMAL ABSORPTION OF CHEMICALS IN WATER.
ENVIRON Corp., Washington, DC.
T. L. Brown, and J. E. Rossi.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1989-2001, 1989. 1 fig, 1 tab, 17 ref.

Descriptors: *Dermal absorption, *Path of pollutants, *Population exposure, *Public health, *Toxicology, *Water pollution, Mathematical studies, Model studies.

A simple method was developed to estimate dermal absorption from variables describing the conditions of exposure and the physical properties of the chemicals in the water. A semiempirical mathematical model is proposed for estimating the dermal absorption of chemicals from dilute aqueous solutions, such as bath water. Absorption depends on the concentration of the chemical in water, the area of skin exposed, the time of exposure, and a permeation coefficient that depends importantly on the relative solubility of the material in lipids and water, among other factors not so easily modeled. Intakes by dermal absorption can be similar to intakes by ingestion from drinking water under certain circumstances for lipophilic chemicals, but they will usually be considerably lower. It has been suggested that residents of the Great Lakes region are at a greater risk of exposure to toxic substances than any other subset of the United States population. This project tested the potential for exposure to toxics by using the levels of toxic substances in fish tissue and sediment as surrogates for human exposure. Data were retrieved from the EPA's STORET database and sorted by USGS water resource regions. STORET is a computerized data base maintained for the storage and retrieval of water quality data within the United States. It is the largest data base available for this purpose, containing data for approximately 150 million individual observations from over 680,000 sampling sites. EPA STORET data for 24 toxics from the 18 USGS regions in the continental United States were retrieved in a statistical summary format. These toxics were chosen because they are National Priority Pollutants for which sufficient STORET data were available. The summaries described the 15th, 50th, 85th percentiles, and minimum, maximum, and mean values for these 24 toxics in sediments and fish tissue for the time periods 1978-1981 and 1982-1987. Data were subjected to two types of statistical analysis. In the first analysis the Great Lakes region was compared to the highest ranked region for each toxic. A second test was designed to provide an index of the potential for exposure by region according to the relative ranks of each toxic. The results indicate that the overall potential for exposure to toxics in the Great Lakes region is not higher than other geographical regions. (Agostine-PTT)

FATE OF CATIONIC SURFACTANTS IN THE MARINE ENVIRONMENT, II: PHOTOOXIDATION OF LONG-CHAIN ALKYLAMINES IN AQUEOUS MEDIA.
Centro de Investigacion y Desarrollo, Barcelona (Spain). Dept. of Environmental Chemistry.
M. Valls, J. M. Bayona, J. Albaiges, and M. Mansour.
Chemosphere CMSHAF, Vol. 20, No. 6, p 599-607, 1990. 3 fig, 1 tab, 15 ref.

Descriptors: *Alkylamines, *Cationic surfactants, *Environment, *Fate of pollutants, *Marine environment, *Oxidation, *Surfactants, Mass spectrometry, Nitrogen compounds, Spectroscopy, Water chemistry.

A variety of long-chain alkylamines (NR1R2R3, where Rn = H, CH3, C14H29, C16H33 or C18H37) have been photooxidized in pure water and seawater (wavelength >290 nm). Half-lives of these amines in the two aqueous systems ranged from 25-95 min. and 175-300 min, respectively, depending on the number and molecular weight of the alkyl substituents. According to mass spectral (CGC-MS) and spectroscopic (IR) data, oxidation products in alpha positions with respect to nitrogen have been tentatively identified. Adduct formation between the photosensitizer (acetone) and secondary aliphatic amines is also detected. The stability of photoproducts was dependent of the photooxidation system and in general, they appeared to be more effective than the original amines. (See also W91-01723) (Author's abstract)

POPULATION EXPOSURE TO CHLOROPHENOLS, DIBENZO-P-DIOXINS AND DIBENZOFURANS AFTER A PROLONGED GROUND WATER POLLUTION BY CHLOROPHENOLS.
National Public Health Inst., Kuopio (Finland). Dept. of Environmental Hygiene and Toxicology.
P. Lampi, T. Vartiainen, and J. Tuomisto.
Chemosphere CMSHAF, Vol. 20, No. 6, p 625-634, 1990. 2 fig, 2 tab, 20 ref.

Descriptors: *Chlorinated hydrocarbons, *Chlorophenols, *Groundwater pollution, *Path of pollutants, *Population exposure, *Water pollution effects, Dibenzofurans, Dioxins, Drinking water, Epidemiology, Finland, Risk assessment.

High concentrations of 70 to 140 microgram/L of total chlorophenols were found in the drinking water of about 3,500 inhabitants in southern Finland in 1987. Total chlorophenol levels from 56,000 microgram/L to 190,000 microgram/L were found in the ground water between a sawmill and the water intake plant. In the present study which was carried out 3 months after closure of the water intake plant, an attempt was made to assess the exposure levels of inhabitants in order to provide the basis for epidemiological studies and risk assessment. Based on urinary excretion of chlorophenols it appears that the population using contaminated water, or fish from the contaminated lake, had been exposed to chlorophenols. No increased PCDD/PCDF (polychlorinated dibenzo-p-dioxins/dibenzofurans) concentrations were found in milk samples from mothers who had used the contaminated water. (Author's abstract)

BUTYLTINS IN SEDIMENTS AND BIVALVES FROM U.S. COASTAL AREAS.
Texas A and M Univ., College Station. Dept. of Oceanography.
T. L. Wade, B. Garcia-Romero, and J. M. Brooks.
Chemosphere CMSHAF, Vol. 20, No. 6, p 647-662, 1990. 6 fig, 1 tab, 32 ref. NOAA Grant 50-DGNC-5-00262 and Texas A&M University Sea Grant (R/ES-18).

Descriptors: *Antifoulants, *Estuaries, *Mollusks, *Organotin compounds, *Path of pollutants, *Sediment contamination, *Sediments, Bioavailability, Coasts, Fate of pollutants, Heavy metals.

The concentration of butyltins in sediments from selected U.S. estuarine areas was determined in order to provide information on the role of sediments as long term sinks for butyltin compounds. Butyltin concentrations in sediment samples from U.S. coastal areas ranged from < 5 to 282 ng Sn/g. Butyltins were detected in 75% of the sediment samples analyzed. The predominant butyltin was tributyltin (TBT), which is also the most toxic. Dibutyltin (DBT) and monobutyltin (MBT) were detected in 30% of the sediment samples analyzed. These TBT degradation products were only found when TBT was present, usually at high concentrations. Mean bivalve butyltin concentrations were 18 times higher than mean sediment concentrations. Based on bivalve analyses, bioavailable butyltins were present at all the sites where butyltins were detected in the sediment. The sediments are

LIBRARY U. OF I. URBANA-CHAMPAIGN

one possible source of these bioavailable butyltins. However, the lack of correlation between sediments and bivalve butyltin concentration indicates that other sources may be predominant. (Author's abstract)

KINETIC STUDY OF THE DECOMPOSITION OF METHYL (1-(BUTYLCARBAMOYL)-1H-BENZIMIDAZOL-2-YL)CARBAMATE (BENOMYL) TO METHYL 1H-BENZIMIDAZOL-2-YLCARBAMATE (MBC).
Brock Univ., St. Catharines (Ontario). Dept. of Chemistry.
R. P. Singh, I. D.. Brindle, C. D. Hall, and M. Chiba.
Journal of Agricultural and Food Chemistry JAFCAU, Vol. 38, No. 8, p 1758-1762, August 1990. 3 fig, 4 tab, 14 ref.

Descriptors: *Chemical analysis, *Degradation, *Fate of pollutants, *Fungicides, *Kinetics, *Path of pollutants, *Pesticides, High performance liquid chromatography, Hydrogen ion concentration, Laboratory methods.

The kinetic study of the degradation of benomyl to methyl 1H-benzimidazol-2-ylcarbamate (MBC) in pure water and in aqueous solutions at pH 1-7 has been carried out by using reversed-phase high-performance liquid chromatography (RP-HPLC) at room temperature (21 =/-1 C). The values of first-order rate constants for the degradation reaction were similar in the pH range 2-7, but at high acid concentration (pH 1.0) the rate constant showed a sharp decrease. This may be due to the protonation of benomyl at low pH where a sharp increase in its solubility was also observed. Quantitative conversion of benomyl to MBC was not observed in acetonitrile; instead, due to the reversible nature of the reaction, at equilibrium about 12% benomyl remained intact. The rate constants for the forward reactions in acetonitrile were found to be .00025/s at 21 +/-1C and .00033/s at 25 +/-1C. In mixed solutions of water with buffer, acetonitrile, or methanol the degradation of benomyl slowed down with the increase in water concentration. (Author's abstract)

PERSISTENT METABOLITES OF ALKYLPHENOL POLYETHOXYLATES IN THE MARINE ENVIRONMENT.
Venice Univ. (Italy). Dept. of Environmental Science.
A. Marcomini, B. Pavoni, A. Sfriso, and A. A. Orio.
Marine Chemistry MRCHBD, Vol. 29, No. 4, p 307-323, July 1990. 3 fig, 6 tab, 33 ref.

Descriptors: *Environment, *Marine pollution, *Metabolites, *Nonionic surfactants, *Path of pollutants, *Phenols, *Surfactants, Algae, Analytical techniques, Sediments, Venice Lagoon, Water.

The persistent metabolites of the nonionic surfactant nonylphenol polyethoxylates (NPnEO, n=1-18), namely nonylphenol (NP), nonylphenol monoethoxylate (NP1EO) and nonylphenol diethoxylate (NP2EO), were analyzed in marine samples including sediment, artificially resuspended sediment and water. The UV-fluorescence high-performance liquid chromatography determination was carried out after Soxhlet extraction with hexane from the sedimentary matrices followed by clean-up on aminosilica minicolumns. Four sampling campaigns at five representative stations of the Venice lagoon were conducted to ascertain temporal and spatial variability of the examined chemicals. A portable resuspending device allowed us to analyze the first 0.01-0.15 mm sediment layer, where the sum of NP, NP1EO and NP2EO was in the range 0.15-13.7 microgram/g (dry weight basis), at least five times higher than in the underlying 5 cm of sediment. Amounts of resuspended material, and concentrations of NP, NP1EO, NP2EO bound to it, showed a marked seasonal dependence: as much as twice the resuspended material, per unit of sediment surface, was measured in April and July, compared with that in February, but resuspended NP, NP1EO and NP2EO per unit of sediment surface were in February one order of magnitude higher. A major factor responsible for this trend was related to the proliferation of macroalgae which contained an average NP+NP1EO+NP2EO concentration of 0.25 plus or minus 0.15 microgram/g (dry wt.). In water, NPEO oligomers with up to 13 ethoxy units were found at an overall concentration range of 0.6-4.5 microgram/L. (Author's abstract)

EFFECTS OF ORGANIC SUBSTRATES ON DECHLORINATION OF AROCLOR 1242 IN ANAEROBIC SEDIMENTS.
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
L. Nies, and T. M. Vogel.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2612-2617, September 1990. 1 fig, 3 tab, 14 ref.

Descriptors: *Acetates, *Biodegradation, *Fate of pollutants, *Glucose, *Methanol, *Microbial degradation, *Polychlorinated biphenyls, *Soil contamination, Anaerobic conditions, Nutrients, Soil bacteria.

The effects of different organic substrates on the abilities of anaerobic sediment enrichments to reductively dechlorinate polychlorinated biphenyls (PCBs) were studied. Sediments collected from a site previously contaminated with PCBs were dosed with additional PCBs (Aroclor 1242;; approximately 300 parts per million (300 micrograms/gram), sediment dry weight) and incubated anaerobically with acetate, acetone, methanol, or glucose. The pattern of dechlorination was similar for each substrate-fed batch; however, the extent and rates of dechlorination were different. Significant dechlorination over time was observed, with the relative rates and extent of dechlorination being greatest for methanol-, glucose-, and acetone-fed batches and least for acetate-fed batches. Dechlorination occurred primarily on the meta- and para-positions of the highly chlorinated congeners, resulting in the accumulation of less-chlorinated, primarily ortho-substituted products. No significant dechlorination was observed in incubation batches receiving no additional organic substrate, even though identical inorganic nutrients were added to all incubation batches. In addition, dechlorination was not observed in autoclaved controls that received substrate and nutrients. (Author's abstract)

INTERACTIONS BETWEEN BACILLUS THURINGIENSIS SUBSP. ISRAELENSIS AND FATHEAD MINNOWS, PIMEPHALES PROMELAS RAFINESQUE, UNDER LABORATORY CONDITIONS.
Environmental Research Lab.-Duluth, MN.
V. M. Snarski.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2618-2622, September 1990. 3 fig, 1 tab, 24 ref.

Descriptors: *Bacillus, *Bacteria, *Biocontrol, *Minnow, *Path of pollutants, *Pesticides, *Toxicity, *Water pollution effects, Bacterial growth, Bioaccumulation, Ecological effects, Microbial transport, Spores.

Interactions between Bacillus thuringiensis subsp. israelensis and fathead minnows, Pimephales promelas, were studied in laboratory exposures to two commercial formulations, Vectobac-G and Mosquito Attack. Mortality among fatheads exposed to 2,000,000 to 6,500,000 colony forming units/ml with both formulations was attributed to severe dissolved oxygen depletion due to formulation ingredients rather than to direct toxicity from the parasporal crystal. No adverse effects were observed at 640,000 colony forming units/ml and below. Fathead minnows rapidly accumulated high numbers of spores with 1 hr of exposure to 220,000 colony forming units of Mosquito Attack/ml, producing whole-body counts of 4,000,000 colony forming units/fish. Comparison of counts on gastrointestinal tract samples and whole-body samples and high numbers of spores in feces indicated that ingestion was the major route of exposure. B. thuringiensis subsp. israelensis spore counts decreased rapidly after transfer of fish to clean water, with a drop of over 3 orders of magnitude in 1 day. Spores were rarely detected in fish after 8 days but were detectable in feces for over 2 weeks. These findings suggest that fish could influence the dissemination of B. thuringiensis subsp. israelensis, and possibly other microbial agents, in the aquatic environment. (Author's abstract)

EFFECT OF SULFATE AND ORGANIC CARBON SUPPLEMENTS ON REDUCTIVE DEHALOGENATION OF CHLOROANILINES IN ANAEROBIC AQUIFER SLURRIES.
Oklahoma Univ., Norman. Dept. of Botany and Microbiology.
E. P. Kuhn, G. T. Townsend, and J. M. Suflita.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2630-2637, September 1990. 6 fig, 1 tab, 37 ref.

Descriptors: *Biodegradation, *Chlorinated hydrocarbons, *Fate of pollutants, *Groundwater pollution, *Microbial degradation, *Organic carbon, *Pesticides, *Sulfates, Anaerobic conditions, Dyes, Halogenated hydrocarbons, Metabolism, Sulfur.

When di-, tri-, and tetrachloroaniline were incubated in methanogenic groundwater slurries, they were reductively dehalogenated by the aquifer microbiota. 2,3,4-Trichloroaniline was metabolized by two pathways. Primary dehalogenation occurred at either the meta or ortho position of this substrate to form 2,4-and 3,4-dichloroaniline, respectively. 3,4-Dichloroaniline could be stoichiometrically converted to 3-chloroaniline. 2,3,4,5-Tetrachloroaniline was degraded by the sequential removal of halogens from the para and then the ortho position to form 3,5-dichloroaniline. An additional pathway was observed with this substrate when the aquifer slurries were amended with butyrate. That is, halogens could be removed from both the meta and ortho positions of tetrachloroaniline. The amendment of sulfate to methanogenic aquifer slurries slowed the rate of 2,3,4-5-tetrachloroaniline degradation and increased the amount of substrate channeled through the additional pathway. The reported intermediates or end products were identified by their chromatographic mobility and mass-spectral profiles. (Author's abstract)

EFFECTS OF LIGHT, TEMPERATURE, NITRATE, ORTHOPHOSPHATE, AND BACTERIA ON GROWTH OF AND HEPATOTOXIN PRODUCTION BY OSCILLATORIA AGARDHII STRAINS.
Helsinki Univ. (Finland). Dept. of Microbiology.
K. Sivonen.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2658-2666, September 1990. 6 fig, 1 tab, 27 ref.

Descriptors: *Cyanophyta, *Eutrophication, *Light intensity, *Nutrients, *Temperature effects, *Toxicity, *Toxins, Aquatic bacteria, Finland, Lakes, Liquid chromatography, Nitrates, Orthophosphates, Oscillatoria, Path of pollutants.

The effects of bacteria, temperature, light, nitrate, and orthophosphate on growth of and hepatotoxin (desmethyl-3-microcystin-RR) production by Oscillatoria agardhii strains were studied under laboratory conditions. Strains were cultivated in Z8 medium under continuous illumination. Growth was determined by measuring dry weight and chlorophyll a, while toxin was analyzed by high-performance liquid chromatography. Two of the three toxic cultures studied produced more toxins

in axenic than in nonaxenic cultures. High toxin production was correlated with high nitrogen concentrations (test range, 0.42 to 84 mg/L) and low light intensity (test range, 12 to 95 microeinsteins/sq m/second). Toxin production depended on phosphorus concentration at low levels of phosphorus (0.1 to 0.4 mg/L) and higher concentrations had no additional effect. The optimum temperature for toxin production and growth of green O. agardhii was 25 C. Red O. agardhii produced almost similar amounts of toxin at temperatures of 15 to 25 C. The lowest toxin production by both strains was at 30 C. (Author's abstract)

INFLUENCE OF PH ON THE ACCUMULATION OF TRI-N-BUTYLTIN CHLORIDE AND TRIPHENYLTIN CHLORIDE IN CARP.
Shiga Prefectural Inst. of Public Health and Environmental Science, Otsu (Japan).
T. Tsuda, S. Aoki, M. Kojima, and H. Harada.
Comparative Biochemistry and Physiology (C) CBPCEE, Vol. 95, No. 2, p 151-153, 1990. 2 fig, 2 tab, 13 ref.

Descriptors: *Antifoulants, *Bioaccumulation, *Biological magnification, *Carp, *Hydrogen ion concentration, *Organotin compounds, *Tributyltin, *Water pollution effects, Path of pollutants.

Bioconcentration factors (BCF) were examined in carp (Cyprinus carpio L.) exposed to organotin compounds at three different pH levels in a continuous flow through system. The order of the BCF in carp at three pH values was pH 7.8 > pH 6.8 > pH 6.0 for both bis(tri-n-butyltin) chloride (Bu3SnCl) and triphenyltin chloride (Ph3SnCl) over the 14 days exposure period. There were significant differences ($P < 0.05$-$P < 0.001$) in the BCF values of both Bu3SnCl and Ph3SnCl between the pH values at 1, 3, 7, 10 and 14 days. Partition coefficients between n-octanol and water (Pow) of both Bu3SnCl and Ph3SnCl increased with increasing pH (pH 5.8-8.0). The increase in the BCF values of Bu3SnCl and Ph3SnCl with increasing pH is probably due to the change of the chemical forms of tributyltin ion to tributyltin hydroxide and tiphenyltin ion to triphenyltin hydroxide. Descriptors: *Bioaccumulation, *Heavy metals, *Mussels, *Nervous system, *Water pollution effects, Brain, Cadmium, Copper, Enzymes, Lead, Mercury, Path of pollutants, Zinc.

Heavy metals influencing the filtering behavior of mussels cause alterations in the serotonergic and dopaminergic systems in the central nervous system of Anodonta cygnea both in vivo and in vitro. Forty hr exposure of the animals to CdCl2 and ZnCl2 caused a transient parallel decrease in 5-HT and DA levels of the ganglia. Also CuCl2, HgCl2 and PbCl2 lowered 5-HT and DA concentrations during treatment; restoration of 5-HT level was rapid, while that of the DA concentration lasted for several days. In isolated ganglia, uptake of 5-HT and DA was inhibited only at high (.0004 moles/L) heavy metal concentrations; only CuCl2 caused 60% depression of DA uptake in .00001 moles/L. Release of monoamines was influenced in a different way: both spontaneous and K-induced 5-HT release were depressed by Zn but were enhanced by Cu, Hg and Pb ions. Spontaneous DA release was enhanced by Cu, while K-induced DA release was increased by Cd, Cu and Zn ions; Hg depressed both. The results give further evidence that heavy metals influence mussels' behavior by influencing the monoamine systems of the brain. The mechanism, however, has not yet been clarified. (Author's abstract)

LABORATORY STUDIES OF THE FLOW OF SOME ORGANIC SOLVENTS AND THEIR AQUEOUS SOLUTIONS THROUGH BENTONITE AND KAOLIN CLAYS.
General Motors Research Labs., Warren, MI. Environmental Science Dept.
A. S. Abdul, T. L. Gibson, and D. N. Rai.
Ground Water GRWAAP, Vol. 28, No. 4, p 524-533, July/August 1990. 11 fig, 4 tab, 13 ref.

Descriptors: *Clays, *Hydraulic conductivity, *Linings, *Organic solvents, Bentonite, Benzenes, Chlorinated hydrocarbons, Flow rates, Kaolinite, Permeameters, Phenols, Toluene.

The following organic solvents and their aqueous solutions were evaluated: benzene, toluene, p-xylene, nitrobenzene, trichloroethylene, ethyl acetate, 2-butanone and phenol. In each experiment, one pore volume of 0.005 N CaSO4 water solution flowed through the clays, followed by several pore volumes of aqueous solution of one of the organic solvents, and then by about three pore volumes of the neat organic solvent. The hydraulic conductivity for the aqueous organic solutions was not significantly different from those of water. The flow of the neat solvents through either the bentonite or kaolin clay increased by up to two orders of magnitude. The aqueous solutions did not change the physical appearance of the clays. The more hydrophobic solvents caused the clays to shrink, producing distinct large vertical cracks. The hydrophilic solvents typically caused the clays to aggregate and fracture. The kaolin clay appeared to aggregate more readily than the bentonite clay. The higher swelling of the clays in water than in the neat organic solvents likely caused the physical changes in the clays and the rapid flow of the neat solvents through them. (Author's abstract)

NATURAL BIOREMEDIATION OF ORGANIC CONTAMINANTS IN GROUND WATER: CLIFFS-DOW SUPERFUND SITE.
Dow Chemical Co., Midland, MI. Environmental Sciences Research Lab.
G. M. Klecka, J. W. Davis, D. R. Gray, and S. S. Madsen.
Ground Water GRWAAP, Vol. 28, No. 4, p 534-543, July/August 1990. 7 fig, 2 tab, 22 ref.

Descriptors: *Biodegradation, *Cliffs-Dow Superfund Site, *Fate of pollutants, *Groundwater, *Groundwater chemistry, *Groundwater pollution, *Organic compounds, *Site remediation, Industrial wastes, Model studies, Phenols, Superfund sites.

Groundwater in the immediate vicinity of an area previously used for the disposal of charcoal manufacturing wastes has been shown to contain low levels of phenolic and polycyclic compounds. Based on the analysis of samples obtained from monitoring wells, the levels of the organic contaminants are reduced to near or below the detection limit within a distance of 100 meters downgradient of the fill. Examination of the groundwater chemistry indicated that the aquifer is essentially aerobic across the site, except in the immediate vicinity of the fill. At this point, dissolved oxygen is apparently depleted due to the biodegradation of organic contaminants introduced into the groundwater, with a concomitant increase in the inorganic carbon concentration. Laboratory microcosm experiments demonstrated that the naturally occurring microorganisms can readily degrade a mixture of the predominant organic contaminants. Half-lives for biodegradation were in the range of 3 to 8 days for phenolic substrates and 11 to 18 days for naphthalene. Computer model simulations indicated that the attenuation observed in the aquifer cannot be explained in terms of physical processes such as adsorption or dispersion, but is consistent with biological degradation. Sixteen Wenner and Schlumberger array electrical soundings were made over portions of the Mallard North landfill in DuPage County, Illinois, to map the gross layered structure of a closed landfill. Sounding curves were fit to standard type curves and values inverted in a least-squares procedure to yield multilayer geoelectrical models. Wood, newspaper, cloth, glass, plastic and metal refuse interspersed with soil exhibited resistivities of 9-19 ohm-m(unsaturated) and 2-7 ohm-m(leachate-saturated). Mature unfractured clay-till cover material exhibited a resistivity of about 30 ohm-m, and its thickness was estimated to within 27% of its true thickness. Larger errors were encountered over fractured and freshly emplaced cover. Soundings were also inverted to yield accurate leachate levels and refuse thickness (errors for both averaged about 30%). Although the soundings produced models with comparable accuracy, the soundings were less sensitive to cover heterogeneities and easier to deploy. Moore's cumulative resistivity interpretation method was found to be unreliable in interpreting this type of resistivity data. However, models generated from electrical resistivity soundings are reasonably accurate in their depictions of internal conditions in this type of landfill. (Author's abstract)

MODELING THE FATE AND TRANSPORT OF ORGANIC CONTAMINANTS IN LAKE ST. CLAIR.
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
G. A. Lang, and T. D. Fontaine.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 216-232, 1990. 3 tab, 10 fig, 33 ref. EPA Interagency Agreement No. DW13931213-01-0.

Descriptors: *Fate of pollutants, *Lake St Clair, *Mathematical models, *Model studies, *Path of pollutants, *Polychlorinated biphenyls, Cesium, Heavy metals, Lake sediments, Lakes.

In order to understand and predict the transport and fate of organic contaminants in Lake St. Clair, a multisegment, contaminant mass balance model was developed based on the Environmental Protection Agency's TOXIWASP model. The model was calibrated and tested against chloride data and cesium-137 data. It was then used to simulate polychlorinated biphenyl and octachlorostyrene (OCS) dynamics in the lake. The model predicted that during 1971-1983, 3.8 MT of OCS entered the lake, 2.8 MT were flushed from the system, 0.8 MT were lost due to biological degradation and volatilization and 0.2 MT remained in the system. The model also predicted that during 1970-1974, 3.4 MT of PCB entered the lake, 2.1 MT were flushed from the system, 2.2 MT were lost due to biological degradation and volatilization and the system mass of PCB decreased from 1.9 to 1.0 MT. RELATIONSHIP BETWEEN CHLORINATED HYDROCARBONS AND ORGANIC CARBON IN SEDIMENT AND POREWATER.
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
P. D. Capel, and S. J. Eisenreich.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 245-257, 1990. 3 tab, 5 fig, 39 ref.

Descriptors: *Chlorinated hydrocarbons, *Interstitial water, *Lake Superior, *Organic carbon, *Path of pollutants, *Polychlorinated biphenyls, *Sediment-water interfaces, *Toxic wastes, Distribution patterns, Fate of pollutants, Larvae, Model studies, Sediment analysis.

Chlorinated hydrocarbons and organic carbon were measured in the bulk sediment, very fine, low density, sediment particles, porewater and Hexagenia naiads of Lake Superior sediment to examine the distrigution of the hydrophobic organic compounds and how this distribution is influenced by organic carbon. The porewater was divided into filtered and unfiltered fractions. The sediment fractions did not behave the same in their affinity to bind the chlorinated hydrocarbons, nor were all of the chlorinated hydrocarbons bound to the same extent. The affinity for most of the hydrocarbons to the solids were in the order: larvae > fine particles > bulk sediment. The filtered porewater organic carbon (dissolved and/or collodial) was about 1/3 to 2/3 as efficient as the bulk sediment organic carbon at binding these hydrophobic compounds. A three-phase (solid, porewater organic carbon, dissolved) competitive model estimates that < 10% of the chlorinated hydrocarbons in the porewater are dissolved. The remaining fraction is associated with the organic porewater colloids. (Author's abstract)

Descriptors: *Hamilton Harbour, *Heavy metals, *Iron, *Lake Ontario, *Phosphorus, *Pollution load, *Sediments, *Water pollution sources, Dredging wastes, Fate of pollutants, Municipal wastewater, Pollutant identification, Spectral analysis, Spoil banks, Suspended solids.

Concentrations of heavy metals and phosphorus were measured in suspended solids collected from Hamilton Harbour, Lake Ontario, in the spring and late summer of 1986. Forms of iron were determined using Mossbauer spectroscopy and related to the concentrations of heavy metals and phosphorus. Two iron forms, wustite and hematite were identified in addition to naturally occurring Fe(2+) from chlorite and clays and Fe(3+) from amorphous iron oxides. The highest metal concentrations are found in deep water and in areas adjacent to outfalls. The concentrations of wustite and hematite are correlated with the concentrations of heavy metals, particularly Zn and Pb. Heavy metals in suspended solids exceed guidelines for open water disposal of dredged sediments. Phosphorus concentrations in suspended solids are high. Higher than average non-apatite inorganic P concentrations in solids are observed in samples taken from the vicinity of municipal discharges. Manganese and iron were released from bottom sediments during summer anoxia in the hypolimnion of the deep water; however, no phosphorus release was observed. The results indicate that wustite and hematite are good tracers of industrial pollution and their distribution is of importance in determining the particle dynamics in Hamilton Harbor. DISTRIBUTION OF HEAVY METALS IN GOVE HARBOUR, NORTHERN TERRITORY, AUSTRALIA.
Northern Territory Univ., Darwin (Australia). School of Chemistry.
N. Peerzada, L. McMorrow, S. Skiliros, M. Guinea, and P. Ryan.
Science of the Total Environment STENDL, Vol. 92, p 1-12, March 1990. 1 fig, 4 tab, 31 ref.

Descriptors: *Aluminum, *Cadmium, *Copper, *Industrial wastes, *Iron, *Lead, *Manganese, *Nickel, *Oysters, *Path of pollutants, *Sediment contamination, *Water pollution, *Water pollution sources, *Zinc, Australia, Bauxite treatment plants, Coastal environment, Heavy metals, Sediment analysis, Water analysis.

The concentration of four metals in waters and eight metals in oysters and sediments from Gove Harbour, Northern Territory, were determined during the dry season of 1987. The measured concentrations in the unfiltered waters were: zinc (1.10-7.28), cadmium (0.10-2.20), copper (0.25-3.45), and lead (0.15-2.87) microgram/L. Heavy metal concentrations (in wet weight, micrograms/gram) obtained for oysters from Gove Harbour were as follows: zinc (60.1-970), cadmium (0.14-4.07), copper (3.77-30.67), lead (not detected-0.46), aluminum (6.50-1123.0), nickel (0.02-0.44), manganese (0.24-2.04), and iron (4.28-981.3). In sediments, the following concentrations, in dry weights (in micrograms/gram) were obtained: zinc (0.09-22.24), cadmium (not detected-0.45), copper (not detected-5.96), lead (not detected-2.98), aluminum (229-16053.5), nickel (0.21-7.70), manganese (13.77-50.24), and iron (759.5-2659.6) Concentrations of zinc, aluminum, and cadmium were higher in the oysters. The level of cadmium exceeded the National Health and Medical Research Council (NHMRC) recommended limit. The levels of these and other metals were higher near a bauxite treatment plant. However, no heavy metal data are available at Gove Harbour to establish natural background levels. (Author's abstract)

Environmental pollution by pentachloronitrobenzene (PCNB) was investigated at Tsumagoi, an intensive farming area, where a great amount of PCNB has been applied. High concentrations of PCNB were detected in river water near an area of cabbage cultivation. Further, pentachloroaniline (PCA) and pentachlorothioanisole (PCTA), which are the principal biodegradation products of PCNB, were also detected, and their ratios to PCNB were higher in autumn than in summer. PCNB concentrations in soil were similar to those of river sediments, in which PCNB was concentrated 5,000-10,000 times over levels in river water. The biodegradation rate of PCNB in river water was higher than in river sediment and soil. The formation rates of PCA from PCNB were higher in river sediment and soil than in river water. It is concluded that PCA remains for a long time in the environment and accumulates in river sediment and soil. (Author's abstract)

The fate and effects of the pulp mill effluent compound 4,5,6-trichloroguaiacol (TCG) were tested over 16 months on a model Baltic Sea littoral zone using a Fucus vesiculosus-based mesoscale model ecosystem. Bioaccumulation of TCG and metabolites from water ranged from 50 times for algae up to 700 times for invertebrates and fish, the factor increasing with trophic level. Algae contained chloroguaiacols, chlorocatechols and chloroveratroles and exhibited no major toxic effects. Fucus colonization appeared to be hindered by filamentous algae which covered surfaces otherwise available for new colonization. This unrestricted filamentous algal growth was probably the result of reduced grazing by herbivores, which in turn was apparently caused by reproduction failure in herbivorous crustaceans. Sediment-dwelling organisms appeared less affected than invertebrates in an algal habitat, possibly because of reduced bioavailability of toxic compounds due to binding to sediment particles. TCG and metabolites in the sediment were dominated by catechols; no veratroles were found. Only in the largest size class of sticklebacks was there a dose-related reduction in mean weight. Only 0.5% of the TCG added was recovered in the system after 16 months. Of this, 99% was associated with the sediment. The remainder was divided equally between algae and fauna. The role of algae and sediment in the Baltic Sea littoral zone is therefore paramount to the ultimate fate and effects of such compounds on invertebrates and fish. (Author's abstract)

Descriptors: *Cadmium, *Chromium, *Copper, *Heavy metals, *Lead, *Meuse River, *Rhine River, *The Netherlands, *Water pollution sources, *Zinc, Aquatic environment, Chemical analysis, Chemical properties, Chlorophyll, Distribution coefficients, Nutrients, Seston, Statistical analysis, Waal River, Water analysis.

Levels of the heavy metals Cd, Cr, Cu, Pb, and Zn, in both the dissolved and particulate phase, were determined in two sampling campaigns in August 1978 and August 1984 in the Dutch Rhine-Meuse (Maas) Delta. Besides the heavy metal concentrations, other important parameters were determined, such as the concentrations of seston, chlorophyll and nutrients. The concentrations of dissolved Cd and of Cd, Pb, and Cu in particulate matter were much higher in 1978 than in 1984, especially for Cd. This may be due to the strict regulations implemented in Germany to reduce the pollution of natural waters by heavy metals. The correlation between the high Cd content and the chlorophyll content is explained by the binding of Cd to living and dead organisms. The distribution of the metals between the dissolved and the particulate phase, indicated by the distribution quotient Kd, increases from low values of Kd for Cu and Zn, to higher values for Cd and Cr, and the highest values for Pb. The differences are explained by various binding forms of each of these metals in natural waters. (Author's abstract)

Rainwater was collected on an event basis at Jabiru, Australia (12 degrees 40 minutes S, 132 degrees 53 minutes E), from 20 October 1983 until 28 March 1984. Analysis showed that rainwater in this area contained only about 20 microequivalents/liter each of major cations and anions. However, the rainfall was acidic (volume weighted mean pH 4.89). The free acidity was due mostly to the presence of formic acid and other unidentified weak organic acids, although sulfuric, nitric, and hydrochloric acids made a significant contributions, especially early in the Wet season. A strong meteorological influence on ion concentration was evident in the consistent decrease in concentration associated with the change in storm classification from transitional to monsoonal. Concentrations of sulfur dioxide, aerosol sulfate and cloudwater sulfate due to emissions from the Mount Isa smelting complex 1200 km distant were calculated according to a simple dispersion model used previously in Australian plume studies. The calculations suggest that Mt. Isa would contribute little to atmospheric acidity at Jabiru under the normal range of meteorological conditions in the region. (Author's abstract)

Descriptors: *Bioaccumulation, *Estuarine environment, *Lipids, *Mytilus, *Path of pollutants, *Polychlorinated biphenyls, *Seasonal variation, *Spatial distribution, Chemical analysis, Mussels, Oosterschelde Estuary, Salinity, The Netherlands, Westerschelde Estuary.

Seasonal and spatial variation in the concentration of polychlorinated biphenols (PCBs), fats (non-polar lipids) and total lipids and the condition of the mussel Mytilus edulis were assessed in three differing water bodies of the Dutch delta area. Highest concentrations of PCBs in the mussel were found in the Westerschelde estuary, with much lower concentrations in the Oosterschelde and the brackish lake Grevelingenmeer. Spatial differences were strongly related to salinity; lower concentrations were found at the more saline stations, pointing to freshwater inputs as being the origin of the PCBs in mussels. The PCB concentration in mussels, on the basis of dry or total weight, in general increased during summer, autumn and winter and decreased strongly during spring. The strong decrease is related to the spawning of gametes. Seasonal changes in the PCB concentrations on the basis of the dry weight were not related to changes in the fat content or the condition of the animals. Only PCBs on a fat basis were negatively related to fat content, indicating a dilution of PCBs during seasonal fat accumulation and concentration of PCBs during fat utilization, in such a way that the total PCB concentration in the animal remains the same. It seems that, besides reproduction, equilibrium partitioning is the most probable mechanism that determines the PCB content of mussels. (Author's abstract)

MERCURY, CADMIUM AND LEAD IN EELS AND ROACH: THE EFFECTS OF SIZE, SEASON, AND LOCALITY ON METAL CONCENTRATIONS IN FLESH AND LIVER.
Essex Univ., Colchester (England). Dept. of Biology.
N. A. E. Barak, and C. F. Mason.
Science of the Total Environment STENDL, Vol. 92, p 249-256, March 1990. 1 fig, 4 tab, 17 ref.

Descriptors: *Absorption, *Bioaccumulation, *Cadmium, *Eel, *Lead, *Liver, *Mercury, *Muscle, *Path of pollutants, *Roach, *Seasonal variation, Aquatic environment, Brett River, Chelmer River, England, Fate of pollutants, Fish physiology, Heavy metals.

Accumulation patterns of contaminants in fish are dependent both on uptake and elimination rates. The uptake of metals is influenced by many factors, including locality, species, sex, age, and state of gonadal maturation. Elimination of metals is an active biochemical and physiological process. Mercury, cadmium and lead were measured in the liver and flesh of 885 eels and 338 roach collected from four sites on the Rivers Brett and Chelmer, eastern England, over the period November 1985 to November 1987. Concentrations of metals in the liver and flesh of both species were highly correlated at all sites. Generally, mercury in flesh and liver were correlated with fish length in both species. There were fewer significant relationships between length and the concentrations of cadmium and lead. Site differences in mean concentrations were recorded. Seasonal variations in metal concentrations were largely restricted to eels from a more polluted site downstream from the town of Chelmsford. The source of the contamination is unknown. The seasonal effects were mainly detected in livers. This may be related to the differences between organs in relation to the binding strength of metals in body proteins. Weakly bound metals in soft organs, such as the liver, may be more easily influenced by seasonal changes compared with strongly bound metals in flesh. (See also W91-01822) (Author's abstract)

MERCURY, CADMIUM AND LEAD CONCENTRATIONS IN FIVE SPECIES OF FRESHWATER FISH FROM EASTERN ENGLAND.
Essex Univ., Colchester (England).
N. A. E. Barak, and C. F. Mason.
Science of the Total Environment STENDL, Vol. 92, p 257-263, March 1990. 1 fig, 3 tab, 9 ref.

Descriptors: *Absorption, *Bioaccumulation, *Cadmium, *Chubs, *Lead, *Mercury, *Path of pollutants, *Perch, *Pike, *Seasonal variation, Aquatic environment, Aquatic life, Biochemistry, Brett River, Chelmer River, Chemical analysis, England, Fate of pollutants, Fish, Heavy metals, Minnow, Tench.

A total of 146 samples of five species of fish were examined between March and November 1986 in four sites from the Rivers Brett and Chelmer in eastern England. Concentrations of mercury, cadmium, and lead were measured in the flesh and liver of 35 dace, 15 chub, 18 tench, 22 perch, and 56 pike. Variations in heavy metals concentrations between the sites and species were found to be related mainly to size differences of fish. Mercury levels in the flesh were higher than in the liver, while cadmium and lead levels were higher in the liver than in the flesh. (See also W91-01821) (Author's abstract)

Descriptors: *Computer programs, *Expert systems, *Groundwater pollution, *Mathematical models, *Optimization, *Sensitivity analysis, Algorithms, Bayes Optimal Decision Rule, Computer models, Model studies, Solute transport models, Statistical studies.

A new methodology for the identification of unknown sources of groundwater pollution is developed. This new methodology is based on the concept of statistical pattern recognition. The statistical pattern recognition algorithm uses Bayes' Optimal Decision Rule. The function of the pattern recognition system is to match statistically an observed set of concentrations in the field with a comparable set obtained by simulating groundwater transport for various disposal conditions. In order to make the application of this methodology easier, an Expert System was developed. This Expert System uses the results obtained by applying the pattern recognition algorithm to select a particular set of pollution source locations and magnitudes. The Expert System also has the capability of adding measures of confidence to alternative selections of sources made by the pattern recognition system, such that these solutions can be ranked according to the subjective confidences supplied by the users. The performance of the

LIBRARY U. OF I. URBANA CHAMPAIGN

pattern recognition system and the Expert System was evaluated for a selected study area. (USGS)

Descriptors: *Aquifers, *Groundwater pollution, *Model studies, *Organic wastes, *Sorption, Mathematical models, North Carolina, Oil wastes, Path of pollutants, Sorption equilibrium models, Water pollution sources.

The groundwater resources of the U.S. have been contaminated by a variety of organic pollutants that include solvents, petroleum products, and pesticides. A need exists to understand the movement of contaminants in the subsurface so that: (1) an assessment of the risk due to contamination may be made; (2) an economical and environmentally acceptable response to contamination may be designed; and (3) an appropriate ranking of sites that require clean-up and that are competing for the same fixed pool of resources may be accomplished. Many common organic contaminants sorb to solid surfaces, like soils or aquifer materials. Sorption affects the rate of transport for a given contaminant in the subsurface and may also affect the rate of contaminant degradation. An understanding of the sorption process is, therefore, an important part of understanding the overall movement of a contaminant in the subsurface. This work focuses on the investigation of the sorption process in the subsurface. Specifically four aspects are considered: the measurement of sorption equilibrium for petroleum-based contaminants to a coastal North Carolina aquifer material; determination of the rate of sorption for these systems; development of mathematical models that may be used to simulate the sorption process; and an analysis of the significance of sorption-desorption rates for predicting field-scale transport of organic contaminants. Laboratory results demonstrate the relative importance of sorption as a function of compound type using aquifer material collected from a Camp Lejeune field site. The sorption process is shown to require several days to approach equilibrium, while the final equilibrium is found to be nonlinear. (USGS)
W91-01827

TRITIUM CONCENTRATIONS IN FLOW FROM SELECTED SPRINGS THAT DISCHARGE TO THE SNAKE RIVER, TWIN FALLS-HAGERMAN AREA, IDAHO.
Geological Survey, Idaho Falls, ID. Water Resources Div.
L. J. Mann.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4156, 1989. 20p, 2 fig, 3 tab, 15 ref.

Descriptors: *Path of pollutants, *Radioactive wastes, *Radioactivity, *Springs, *Tritium, Idaho, Idaho National Engineering Laboratory.

Concern has been expressed that some of the approximately 30,900 curies of tritium disposed to the Snake River Plain aquifer from 1952 to 1988 at the INEL (Idaho National Engineering Laboratory) have migrated to springs discharging to the Snake River in the Twin Falls-Hagerman area. To document tritium concentrations in springflow, 17 springs were sampled in November 1988 and 19 springs were sampled in March 1989. Tritium concentrations were less than the minimum detectable concentration of 0.5 pCi/mL (picocuries/mL) in November 1988 and less than the minimum detectable concentration of 0.2 pCi/mL in March 1989; the minimum detectable concentration was smaller in March 1989 owing to a longer counting time in the liquid scintillation system. The maximum contaminant level of tritium in drinking water as established by the U.S. Environmental Protection Agency is 20 pCi/mL. U.S. Environmental Protection Agency sample analyses indicate that the tritium concentration has decreased in the Snake River near Buhl since the 1970's. In 1974-79, tritium concentrations were less than 0.3 +/-0.2 pCi/mL in 3 of 20 samples; in 1983-88, 17 of 23 samples contained less than 0.3 +/-0.2 pCi/mL of tritium; the minimum detectable concentration is 0.2 pCi/mL. On the basis of decreasing tritium concentrations in the Snake River, their correlation to cessation of atmospheric weapons tests tritium concentrations in springflow less than the minimum detectable concentration, and the distribution of tritium in groundwater at the INEL, aqueous disposal of tritium at the INEL has had no measurable effect on tritium concentrations in springflow from the Snake River Plain aquifer and in the Snake River near Buhl. (USGS)

INORGANIC AND ORGANIC GROUNDWATER CHEMISTRY IN THE CANAL CREEK AREA OF ABERDEEN PROVING GROUND, MARYLAND.
Geological Survey, Towson, MD. Water Resources Div.
M. M. Lorah, and D. A. Vroblesky.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4022, 1989. 97p, 3 pl, 11 fig, 16 tab, 49 ref.

Descriptors: *Aromatic compounds, *Chlorinated hydrocarbons, *Fate of pollutants, *Groundwater pollution, *Maryland, *Path of pollutants, *Water quality, Aberdeen Proving Ground, Aliphatic hydrocarbons, Chemical degradation, Coastal aquifers, Inorganic compounds, Microbial degradation, Organic solvents, Physicochemical properties, Unconsolidated aquifers.

Groundwater chemical data were collected from November 1986 through April 1987 in the first phase of a 5-year study to assess the possibility of groundwater contamination in the Canal Creek area of Aberdeen Proving Ground, Maryland. Water samples were collected from 87 observation wells screened in Coastal Plain sediments; 59 samples were collected from the Canal Creek aquifer, 18 from the overlying surficial aquifer, and 10 from the lower confined aquifer. Dissolved solids, chloride, iron, manganese, fluoride, mercury, and chromium are present in concentrations that exceed the Federal maximum contaminant levels for drinking water. Elevated chloride and dissolved-solids concentrations appear to be related from contaminant plumes but also could result from brackish-water intrusion. Excessive concentrations of iron and manganese were the most extensive water quality problems found among the inorganic constituents and are derived from natural dissolution of minerals and oxide coatings in the aquifer sediments. Volatile organic compounds are present in the Canal Creek and surficial aquifers, but samples from the lower confined aquifer do not show any evidence of contamination by inorganic or organic chemicals. The volatile organic contaminants detected in the groundwater and their maximum concentrations (in micrograms/L) include 1,1,2,2-tetrachloroethane (9,000); carbon tetrachloride (480); chloroform (460); 1,1,2-trichloroethane (80); 1,2-dichloroethane (990); 1,1-dichloroethane (3.1); tetrachloroethylene (100); trichloroethylene (1,800); 1,2-trans-dichloroethylene (1,200); 1,1-dichloroethylene (4.4); vinyl chloride (140); benzene (70); and chlorobenzene (39). On the basis of information on past activities in the study area, some sources of the volatile organic compounds include: (1) decontaminants and degreasers; (2) clothing-impregnating operations; (3) the manufacture of impregnite material; (4) the manufacture of tear gas; and (5) fuels used in garages and at the air-field. The high density of most of the detected organic compounds in free-product form would have aided their movement into the aquifers by vertical sinking. The outcrop area of the upper confining unit and an area cut by a paleochannel are most susceptible to contamination because a near-surface impermeable layer is not present. (USGS)

HYDROGEOLOGIC, WATER-LEVEL, AND WATER-QUALITY DATA FROM MONITORING WELLS AT THE U.S. MARINE CORPS AIR STATION, CHERRY POINT, NORTH CAROLINA.
Geological Survey, Raleigh, NC. Water Resources Div.
L. C. Murray, and K. M. Keoughan.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4200, 1990. 86p, 14 fig, 9 tab, 26 ref.

Descriptors: *Cherry Point, *Groundwater pollution, *Hydrologic data, *Monitoring, *North Carolina, *Observation wells, *Water quality, *Water resources data, Hydrogeology, Pollutant identification, Sedimentary petrology.

Unlined hazardous-waste disposal sites at the U.S. Marine Corps Air Station, Cherry Point, North Carolina, are located near drinking water supply wells that tap the Castle Hayne aquifer. Hydrogeologic and water quality data were collected near two of these sites from 12 monitoring wells installed in May to June 1987. Near the northernmost disposal site, differences in hydraulic head between the surficial, intermediate Yorktown, and Castle Hayne aquifers indicate the potential for migration of contaminants downward into the Castle Hayne. Movement would be impeded, however, by two confining units that separate the three aquifers. Near the southernmost landfill, these units are thin and discontinuous. However, water-level data in this area indicate that water from both the Castle Hayne and Yorktown aquifers flows upward into the surficial aquifer, which reduces the potential for downward contaminant movement. Groundwater in the surficial aquifer at both sites moves laterally away from nearby drinking water supply wells and toward Slocum Creek. Elevated concentrations of trichloroethylene and 1,2-dichloroethene (4,600 and 4,800 ug/L (micrograms per liter), respectively) were detected in water samples collected from the surficial aquifer near the southernmost landfill; smaller concentrations were detected in the Yorktown aquifer (16 and 8 ug/L, respectively). With the exception of iron and manganese, trace metals detected in the wells sampled near both landfills were below U.S. Environmental Protection Agency drinking water standards. Highest concentrations of priority pollutant metals detected were for zinc (60 ug/L) and chromium (36 ug/L). (USGS)

COMPARING THE EFFECTS OF ACIDIC DEPOSITION ON THE CHEMISTRY OF SMALL STREAMS IN THE SOUTH ISLAND OF NEW ZEALAND WITH THOSE IN THE FICHTELGEBIRGE, F.R.G.
Bayreuth Univ. (Germany, F.R.). Lehrstuhl fuer Hydrologie.
A. Stenzel, and R. Herrmann.
Catena, Vol. 17, No. 1, p 69-83, February 1990. 2 fig, 6 tab, 22 ref.

Descriptors: *Acid rain effects, *Acid streams, *Acidic water, *Aluminum, *New Zealand, *Organic acids, *Water chemistry, *Water pollution sources, *West Germany, Conductivity, Deposition, Fluorides, Phosphates, Sediment load, Statistical analysis, Streams, Sulfates, Water sampling.

There are some major differences in the chemical composition of unpolluted clear and brownwater (natural acid) streams in New Zealand and the polluted White Main in Bavaria, West Germany. Sulfate concentrations are 10 to 20 times higher in the White Main and atmospheric inputs of strong acids (H2SO4 and HNO3) cause pH values of 5.0 and lower. Clearwaters in New Zealand show neutral pH values of between 6.6 and 8.0 whereas brownwaters have a pH of 4.0, but their acidity is derived from organic acids. Concentrations of aluminum are low in the New Zealand clearwaters and consist mainly of polymeric species. Brownwaters show relatively high aluminum concentrations, dominated by monomeric aluminum species, but these are complexed with organic acids. In contrast to this, the White Main has high concentrations of the toxic monomeric inorganic form. Inputs of strong mineral acids on natural acid streams may induce a change in the aluminum chemistry and turn the organic nontoxic aluminum species into toxic forms. There is not a significant difference in major cation concentrations between the White Main and New Zealand streams. Variation in the New Zealand water samples is caused by location differences, for example, coastal streams have higher concentrations of sea salt cations than inland waters. (Author's abstract)

TRAVEL TIMES OF SEEPAGE WATER THROUGH MULTILAYERED COVERING SYSTEMS FOR HAZARDOUS WASTE SITES.
Karlsruhe Univ. (Germany, F.R.). Dept. of Applied Geology.
S. Wohnlich.
Environmental Geology and Water Sciences EGWSEI6, Vol. 15, No. 2, p 137-144, March/April 1990. 7 fig, 6 ref.

Descriptors: *Barriers, *Flow velocity, *Hazardous materials, *Infiltration, *Landfill covers, *Lysimeters, *Path of pollutants, *Seep water, *Seepage, *Traveltime, *Waste disposal, Drainage, Field tests, Hydraulic design, Porosity, Soil water, Surface runoff, Tracers.

In a field experiment station near Frankfurt am Main, West Germany, a three-layer covering system was constructed in order to evaluate the amount of seepage water through clay barrier systems and their long-term effectiveness. The test area was equipped with two large-scale lysimeters, excess tubes (for neutron-moisture and gamma-gamma-density measurements), tensiometers, surface runoff and drain discharge recorders and other meteorological instruments. The results of the three-year observation period gave a complete record of the infiltration and seepage process within the different covering layers. With the help of hydrochemical and isotope analyses, as well as with tracer experiments, the velocity of the soil water was determined. Three major waterpaths were found in the vadose zone of the vegetation support layers as well as in the saturated zone of the barrier layer. Very low velocities followed the matrix porosity of the soil. High velocities occur along preferential waterpaths which follow inhomogeneities within the soil. Minor parts of the lysimeter outflow react directly with the precipitation inflow and, therefore, reveal that unretarded flowpaths exist as well. The higher the compaction of the clay, the more dominant is the influence of preferential flow paths. The travel times through the clay barriers are much faster than currently thought. A breakthrough in contaminants occurs much earlier than estimated by assuming homogeneous flow. It is recommended that large scale field tests using simple flexible lysimeters be used to determine the effective flux density at each individual site. (Stoehr-PTT)

CHEMICAL THREAT TO THE ENVIRONMENT IN POLAND.
Lublin Technical Univ. (Poland). Dept. of Water and Wastewater Technology.
A. Pawlowski.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 1-21, July 1990. 1 fig, 14 tab, 7 ref.

Descriptors: *Acid rain, *Air pollution, *Environmental quality, *Heavy metals, *Poland, *Political aspects, *Pollution load, *Soil contamination, *Water pollution sources, Acidic soils, Carcinogens, Economic aspects, Environmental effects, Environmental policy, Foods, Human diseases, Nitrous oxide, Sulfur dioxide, Trace elements, Vistula River.

Pollution of the environment in Poland is characterized and the concentrations of SO2, NOx, dust and metals in the air are tabulated. Surface water is classified according to sanitary standards, and the concentrations of heavy metals in the River Vistula are presented. Soil is mainly polluted with trace elements such as mercury, lead, cadmium, zinc, copper and flourine. Eighty-three percent of the cultivated soils in Poland are acidic due to the interaction of sulfur and its compounds deposited on the ground with other atmospheric contaminants. The causes and sources of food contamination include fertilizers, pharmaceutical preparations given to animals, and food processing and packaging. The characteristics of the Polish economy which may influence the nation's pollution problems include the nation's high energy consumption and the inability to manufacture suitable equipment for environmental restoration. In addition, purchasing equipment from abroad is limited due to Poland's shortage of hard currency. Significant changes should not be expected in the next few years without international assistance. There are unsolved problems concerning the influx of SO2 and other pollutants from other countries. Poland also exports air pollutants to other countries. For environmental quality to improve, all the surrounding countries have to agree on implementing beneficial environmental policies. (Stoehr-PTT)

OCCURRENCE OF HEAVY METALS IN WATER, PHYTOPLANKTON, AND ZOOPLANKTON OF A MESOTROPHIC LAKE IN EASTERN POLAND.
Akademia Rolnicza, Lublin (Poland). Dept. of Zoology and Hydrobiology.
S. Radwan, W. Kowalik, and C. Kowalczyk.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 115-120, July 1990. 2 fig, 1 tab, 17 ref.

Descriptors: *Bioaccumulation, *Heavy metals, *Lakes, *Mesotrophic lakes, *Path of pollutants, *Phytoplankton, *Poland, *Zooplankton, Cadmium, Cobalt, Copper, Iron, Lake Piaseczno, Lead, Manganese, Pollutant identification, Water pollution, Zinc.

The concentrations of the heavy metals copper, zinc, manganese, iron, cadmium, lead, and cobalt were determined in phytoplankton, zooplankton and water of the mesotrophic Lake Piaseczno. The zooplankton community consists of three basic groups, Rotaria, Cladocera and Copepoda, which were caught in light traps. Net phytoplankton is represented mainly by Chlorophyta and Conjugatea. The concentrations of heavy metals differed in phytoplankton and zooplankton, especially with respect to Mn, Pb, Cu and Cd. For both communities the highest metal concentrations were exhibitied by iron, zinc and manganese. These levels were many times higher than the levels in water. Manganese was at a higher concentration in the phytoplankton than in the zooplankton, and lead, copper and cadmium were at higher concentrations in the zooplankton than in the phytoplankton. High bioaccumulation indices for both plankton communities were found for iron, manganese and zinc, and very low indices were found for lead and cadmium. This may be evidence of the rate and selective uptake of particular trace metals by the phytoplankton and zooplankton. If the bioaccumulation index for one trace metal is higher than that of a second trace metal, then the former is absorbed more rapidly from water by a given plankton community. (Stoehr-PTT)

ACCUMULATION OF HEAVY METALS IN A LAKE ECOSYSTEM.
Akademia Rolnicza, Lublin (Poland). Dept. of Zoology and Hydrobiology.
S. Radwan, W. Kowalik, and R. Kornijow.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 121-129, July 1990. 1 tab, 27 ref.

Descriptors: *Bioaccumulation, *Heavy metals, *Lakes, *Mesotrophic lakes, *Path of pollutants, *Plankton, Benthos, Fish, Lake Piaseczno, Phytoplankton, Poland, Sediment contamination, Water pollution, Zooplankton.

The concentrations of copper, zinc, iron, manganese, cadmium, nickel, lead, and cobalt were determined in water, bottom sediments, plankton, zoobenthos and ichthyofauna of mesotrophic Lake Piaseczno located in eastern Poland. In water, sediments, plankton and benthos, the most abundant heavy metals were iron, zinc and manganese. In fish zinc, copper and manganese were most abundant. The amount of heavy metals in the biotic components was dependent upon their concentration in water and partly upon the concentration in bottom sediments. A considerably less important role in the translocation of heavy metals is probably played by trophic interactions. (Author's abstract)

ASSESSMENT OF ALUMINUM MOBILIZATION AND PATHWAYS IN THE BIRKENES CATCHMENT, SOUTHERN NORWAY.
Oslo Univ. (Norway). Dept. of Chemistry.
R. Vogt, H. M. Seip, N. Christophersen, and S. Andersen.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 139-158, July 1990. 6 fig, 3 tab, 39 ref.

Descriptors: *Acid rain effects, *Acid streams, *Aluminum, *Model studies, *Norway, *Path of pollutants, *Temporal distribution, Lysimeters, Mathematical models, Soil water, Streams, Sulfur compounds, Tracers, Water pollution.

In spite of considerable research efforts the detailed mechanisms involved in acidification, and in particular those controlling aluminum concentrations in water, have not been satisfactorily established. Earlier work on acidification carried out in the Birkenes catchment in sourthern Norway is briefly reviewed. Temporal variation in acidity and aluminum concentrations in stream water are related to variations in ionic loadings. Addition of sodium bromide to two small soil plots in Birkenes resulted in high concentrations of hydrogen in the organic horizon and of aluminum in the eluvial horizon. The experiment supports the hypothesis presented earlier that water pathways are of great significance in determining stream water chemistry. The improvement of existing models for calculating stream water aluminum concentrations may require the use of at least three soil reservoirs in a model to reproduce observed aluminum satisfactorily. (Author's abstract)

ARE MATHEMATICAL MODELS USEFUL FOR UNDERSTANDING WATER ACIDIFICATION.
Oslo Univ. (Norway). Dept. of Chemistry.
A. Stone, and H. M. Seip.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 159-174, July 1990. 5 fig, 1 tab, 18 ref, append.

Descriptors: *Acid rain, *Acidic water, *Mathematical models, *Model studies, *Simulation, Chemical analysis, Computer models.

Computer models play an integral part in the effort to understand the complicated processes which

affect ecosystems subjected to acid precipitation. Current research work using the Birkenes (Norway) model attempts to improve the evaluation of the present model structure and subjects the program to a stringent verification process. Simulation results for years which are not included in the calibration period are described. Checking model parameters against data sets not used in the calibration process is essential. The importance of model validation is emphasized. The simulations, though in agreement with the observations, are still deficient is some respects and possible model improvements are necessary. In addition, problems which appeared during model validation were also found during verification procedures. However, computer simulations have provided a powerful tool for evaluating current thinking regarding chemical processes involved in environmental problems such as acid precipitation. ALUMINUM MOBILIZATION IN SOIL AND STREAM WATERS AT THREE NORWEGIAN CATCHMENTS WITH DIFFERENT ACID DEPOSITION AND SITE CHARACTERISTICS.
Senter for Industriforskning, Oslo (Norway).
N. Christophersen, C. Neal, R. Vogt, J. M. Esser, and S. Andersen.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 175-188, July 1990. 5 fig, 5 tab, 24 ref.

Descriptors: *Acid rain effects, *Aluminum, *Deposition, *Norway, *Soil chemistry, *Soil water, *Water pollution effects, Cation exchange, Hydrogen ion concentration, Ion exchange, Model studies.

Streamwater, soil water, and soil chemistry data were collected for three Norwegian headwater catchments and comparisons made to allow assessment of the effects of acid deposition on aluminum mobilization. Two of the sites, situated in the most heavily impacted area of southern Norway, show pronounced differences in streamwater chemistry, especially at highflow. At Birkenes I, the pH reaches 4.2 and the inorganic monomeric aluminum reaches 20 microM, compared with a pH of 5-4.6 and aluminum at 3 microM at Birkenes II. The third catchment (Ingabekken) is in a pristine area in mid-Norway where streamwater pH changes from 7.2 at baseflow to 5 at highflow. In this case, aluminum is less than 1 microM. The differences in streamwater chemistry are mirrored in the soil solution composition at the three sites. Major differences also occur in the compositions of exchangeable ions, even though cation exchange capacities are similar. In the pristine area, exchangeable aluminum is low, with the exchange complex being dominated by hydrogen. This contrasts with the impacted sites where exchangeable aluminum is much more abundant, especially at Birkenes I. It is concluded that one of the main changes observed during acidification is the conversion of the soil exchange complex from a hydrogen-dominated form to one where aluminum plays an increasingly important role. Such a transformation is not included in most acidification models and should be the focus of further model development. (Author's abstract)

ATMOSPHERIC INPUT OF INORGANIC NITROGEN SPECIES TO THE KIEL BIGHT.
Kiel Univ. (Germany, F.R.). Inst. fuer Meereskunde.
R. Prado-Fiedler.
Helgolaender Meeresuntersuchungen HEMEDC, Vol. 44, No. 1, p 21-30, August 1990. 4 fig, 4 tab, 22 ref. Umweltbundesamt (UBA) grant no. 10204215/4.

Descriptors: *Air pollution, *Chemistry of precipitation, *Kiel Bight, *Nitrogen, *Nitrogen compounds, *Nutrients, *Path of pollutants, *Water pollution sources, Deposition, Phytoplankton, Precipitation.

The atmospheric input of inorganic nitrogen species to the Kiel Bight (south-west Baltic Sea) was measured by collecting marine precipitation samples at Kiel Lighthouse in weekly intervals during a whole year, using wet-only and bulk-sample methods. The temporal patterns of nitrate and ammonium concentrations are highly variable, with less variability during summer. Maximum concentrations were found in winter. The annual precipitation weighted mean concentrations are 124 micromoles/cu dm for nitrate and 172 micromoles/cu dm for ammonium. Nitrite concentrations were low, its contribution to wet deposition being thus negligible (on average only 0.3% of the wet deposition of nitrate plus ammonium). Dry deposition represents approximately one third of the total input of airborne nitrogen species. Wet and dry deposition represents an annual input of around 5000 tons of nitrogen to the Kiel Bight (2571 sq km) which is a significant contribution to the total nitrogen content (5900 tons in winter). Rain does not fall uniformly along a front system and marine rains are usually associated with showers having a typical horizontal cross section of 500 m to 5 dm, the intense episodic input of nitrogen species concentrated in a relatively small area may contribute to the formation of a patch of phytoplankton. Hence, the origin of phytoplankton patchiness may be related to the charateristic pattern of precipitation. (Author's abstract)

URANIUM AND THORIUM IN MUSCLE TISSUE OF FISH TAKEN FROM THE SOUTHERN BALTIC.
Akademia Medyczna, Gdansk (Poland). Dept. of Analytical Chemistry.
P. Szefer, K. Szefer, and J. Falandysz.
Helgolaender Meeresuntersuchungen HEMEDC, Vol. 44, No. 1, p 31-38, August 1990. 1 fig, 4 tab, 43 ref.

Descriptors: *Baltic Sea, *Bioaccumulation, *Biological magnification, *Fish physiology, *Thorium, *Uranium, Cod, Food chains, Herring, Mollusks, Sprat, Tissue analysis.

The determination of uranium (U) and thorium (Th) was carried out on pooled muscle tissue samples of cod (Gadus morhua), herring (Clupea harengus), sprat (Sprattus sprattus) and other species of fish caught in 1981 in the southern Baltic. The mean levels of U in the muscle tissue were 0.30 ng/g for cod (Gadus morhua), 0.29 ng/g for herring (Clupea harengus) and 0.44 ng/g for sprat (Sprattus sprattus) on a wet-weight basis. For Th the concentrations were 0.41 ng/g for cod, 0.38 ng/g for herring, and 0.64 ng/g for herring. For the other species analyzed, the muscle levels of U varied from 0.22-0.42 w.w and of Th from 0.43-1.6 ng/g w.w. Elevated levels of U were also found in whole specimens of stickleback (Gasterosteus aculeatus) (2.6ng/g w.w.). The muscle-levels of U were comparable to the lowest values reported by other authors for Japanese and Black Sea Fish. The ratio of Th/U (by weight) for Gadus morhua, Clupea harengus and Sprattus sprattus was near unity. The average southern Baltic water data for U and Th in fish and other Baltic organisms were used to calculate the concentration factor (CF). The values of CF-U and CF-Th for fish as well as for other representatives of Baltic biocenosis reveal that the soft tissue of mollusks had high concentrations of U and whole specimens of Mesidothea entomon had high concentrations of Th. However, in fish the smallest amounts of the two elements were concentrated. To determine the degree of discrimination of U in respect to Th in Baltic organisms, the discrimination factor DF was estimated and results showed that analyzed organisms exhibit a stronger ability to adsorb and/or take up Th as compared to U. The U and Th transfer along the trophic levels of the food chain was quantitatively estimated by the transfer factor TF. TF values suggested that there is no biomagnification of these elements along the food chain steps leading to fish from their potential diet. (Fleishman-PTT)

DENITRIFICATION AND NITROUS OXIDE IN THE NORTH SEA.
Plymouth Marine Lab. (England).
C. S. Law, and N. J. P. Owens.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 1/2, p 65-74, May 1990. 7 fig, 1 tab, 26 ref.

Descriptors: *Coastal waters, *Denitrification, *Fate of pollutants, *Nitrogen, *Nitrogen oxides, *North Sea, *Sediment chemistry, German Bight, Nitrates, Nitrification, Norwegian Trench.

In situ sediment denitrification rates were determined in the major areas of deposition of the North Sea, using the acetylene block technique. In addition, nitrous oxide profiles of the water column were determined. Nitrous oxide production generally occurred in the photic zone possibly due to nitrification; and throughout the water column in the German Bight region. Consumption at depth was possibly due to reduction in the anoxic microzones of fecal pellets, concentrated at the thermocline. Saturation of surface waters was 102.2% compared to 130.3% in the German Bight region. Calculated flux of nitrous oxide to the atmosphere was 9.5 times 10 to the 6th power kg per year, over half of which was produced in the German Bight. Sediment denitrification rates varied through three orders of magnitude; the highest value of 150 micromoles per meter squared per day was recorded in the Norwegian Trench. Nitrous oxide production by the sediments was low (1.1 micromoles per meters squared per day max.), and was undetectable at half of the sites. Sediment nutrient profiles exhibited porewater nitrate concentrations exceeding that of the overlying water suggesting that denitrification was fuelled by nitrification, which, in turn was related to other environmental variables. A significant positive relationship existed between in situ denitrification rate and the nitrate content of the upper sediment. Extrapolation of the rate to the total area of deposition in the North Sea suggests that denitrification is responsible for a minimum loss of 7.5-12% of the total annual nitrogen contaminant input. (Author's abstract)

CONCENTRATIONS OF ORGANOCHLORINE COMPOUNDS IN THE HERMIT CRAB PAGURUS BERNHARDUS FROM THE GERMAN BIGHT, DECEMBER 1988 - MAY 1989.
Hamburg Univ. (Germany, F.R.). Inst. fuer Biochemie und Lebensmittelschemie.
R. Knickmeyer, and H. Steinhart.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 3, p 365-376, June 1990. 16 fig, 2 tab, 39 ref.

Descriptors: *Bioaccumulation, *Chlorinated hydrocarbons, *Crabs, *German Bight, *North Sea, *Path of pollutants, DDE, Distribution patterns, Lindane, Polychlorinated biphenyls, Tissue analysis.

The contamination of Pagurus bernhardus with PCB (as the sum of concentrations of 36 individual components) p, p'-DDE, HCB, alpha-HCH and Lindane (gamma-HCH) was determined in samples collected between December 1988 and May 1989 in the German Bight. Consistent values of congener composition were shown to exist in the abdo-

mens when individual congener levels were expressed as percentages of total composition. This value does not appear to be influenced by total concentration, lipid content of the tissue or the sampling position in the German Bight. A comparison of PCB patterns in the hermit crab and zooplankton shows that P. bernhardus accumulated penta-, to decachlorobiphenyls which lack vicinal H atoms in meta-para positions. The body burdens of cyclic organochlorines changed with time, but this change was different for different compounds at the same sampling stations for the same compound. These changes were not correlated to natural seasonal events or changing lipid content of the tissues, but were strongly influenced by their sources. The concentrations of aromatic compounds slightly reflected time integrating characteristics, whereas the alpha/gamma-HCH ratio was useful in identifying sudden changes in the influence of rivers as well as water masses coming from the central North Sea. ZINC AND COPPER IN FISH FROM NATURAL WATERS AND REARING PONDS IN NORTHERN ITALY.
Bologna Univ. (Italy). Ist. di Biochimica.
L. Carpene, O. Cattani, G. P. Serrazanetti, G. Vedrizzi, and P. Cortesi.
Journal of Fish Biology JFIBA9, Vol. 37, No. 2, p 293-299, August 1990. 1 fig, 7 tab, 20 ref.

Descriptors: *Bioaccumulation, *Copper, *Fish, *Path of pollutants, *Zinc, Absorption, Bass, Goldfish, Heavy metals, Liver, Muscle.

Zinc and copper were detected in several tissues of fresh and saltwater fish. Liver concentrations of heavy metals varied widely, with respect to the storage and detoxication functions of the organ. In muscle tissues the two metals were linked to aerobic metabolism, and were higher in the heart and lower in the white muscle. High levels of zinc were found in the female gonad, while in the brain zinc levels were more constant and possibly regulated better than copper. In sea bass supplemented with artificial diets no correlation was found between the metal content in the diet and that of the tissue. In goldfish attempts to isolate specific metal binding proteins of low molecular weight using gel filtration gave negative results; the metals were mostly bound to ligands excluded from the gel. Descriptors: *Absorption, *Bioaccumulation, *Depuration, *Fenitrothion, *Path of pollutants, *Pesticide toxicity, *Pesticides, *Shrimp, *Toxicity, *Water pollution effects, Degradation, Fenoxon, Juvenile growth stage.

A comparative study was made of the toxicity, absorption and depuration of fenitrothion (dimethyl 3-methyl-4-nitrophenyl phosphorothionate; FS) and its oxon (FO) in Japanese tiger shrimp Penaeus japonicus. It was previously reported that the toxicity of FO to the shrimp was approximately 10-20 times higher than that of FS in the intramuscular administration test, and also that FO showed about 12,000 times higher acetylcholinesterase inhibition compared with FS. In the lethal concentration (LC50) test, however, the toxicity of FO to young and juvenile tiger shrimp was only 1/10-1/50 that of FS, contrary to its toxicity in vivo. The results in the absorption and depuration test of C14-FS and C14-FO for juvenile tiger shrimp juvenile demonstrated that the absorption rate of FS in the shrimp was approximately 40 times that of FO, and that the FS absorbed by the shrimp from surrounding water was rapidly biotransformed to more toxic FO, resulting in the high toxicity of FS to the shrimp compared with FO in the LC50 test. PREDICTION OF MINE DRAINAGE QUALITY IN PENNSYLVANIA.
Pennsylvania Dept. of Environmental Resources, Harrisburg. Div. of Mine Drainage Control and Reclamation.
K. B. C. Brady, and R. J. Hornberger.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 5, p 8-15, September/October 1990. 9 fig, 17 ref.

Descriptors: *Acid mine drainage, *Coal mining effects, *Mine wastes, *Pennsylvania, *Water quality, Carbonates, Groundwater pollution, Path of pollutants, Pyrite, Sulfur, Water pollution sources, Weathering.

Numerous factors must be considered to predict post-mining water quality from surface coal mines. Factors considered in Pennsylvania are post-mining water quality on similar or adjacent mine sites, premining water quality, lithologic factors, weathering of overburden, and overburden analysis (a chemical analysis of the rock to be disturbed by mining). Examining of post mining water quality is limited where stratigraphic or chemical changes occur between sites, mining practices such as disposal of high sulfur coal refuse may adversely affect water quality, multiple seam mining has occurred and the observed water quality can not be tied to one particular coal seam or overburden, and hydrologic complications make it difficult to relate water quality to previous mining. Premining water quality can be a useful indicator of overburden chemistry. The presence of predominantly sandstone overburden has been linked to acid mine drainage due to the inability of this lithology to neutralize acid generated by ion exchange. Weathering processes can result in the near surface dissolution of carbonates. Acid-base accounting is the most commonly used method of overburden analysis in Pennsylvania. This technique identifies potentially alkaline and acidic strata by laboratory analysis of rock obtained from drill holes. Neutralization potential and sulfur content of rock should also be tested when evaluating mining strata. Strata with neutralization potentials of <30 tons/1000 tons do not generally contribute significant alkalinity to post mining water quality. Strata with sulfur contents >0.5% and low neutralization potential will generally form acid mine drainage. (Geiger-PTT)

Descriptors: *Bioaccumulation, *Dioxins, *Netherlands, *Path of pollutants, *Polychlorinated biphenyls, *Water birds, Animal tissues, Cormorants, Eel, Fish, Food chains, Grebes, Herons, Metabolites, Tissue analysis.

In the period 1980 to 1982, 19 Cormorants (Phalacrocorax carbo), three Grey Herons (Ardea cinerea) and one Great Crested Grebe (Podiceps crisatus) were collected in The Netherlands. The livers of these fish-eating species were analyzed for polychlorinated dibenzo-p-dioxins and dibenzofurans. Only congeners with a 2,3,7,8-chlorine substitution pattern were found in the livers. Major components were 2,3,4,7,8-pentachlorodibenzofuran and 1,2,3,6,7,8-hexachlorodibenzo-p-dioxin. 2,3,7,8-Tetrachlorodibenzo-p-dioxin and 1,2,3,7,8-pentachlorodibenzo-p-dioxin were also present. Six pooled samples of the Eel Anguilla anguilla, showed the same congeneric pattern of chemicals as found in these bird species. In the Eel, 2,3,4,7,8-pentachlorodibenzofuran and 1,2,3,6,7,8-hexachlorodibenzo-p-dioxin were generally present in the 1 to 5 ng/kg range. Since the Eel is the Cormorant's major food, this indicates strong bioaccumulation for both congeners in the liver of the Cormorant. Significant correlations were found between the various congeners retained in the liver of the Cormorant. It is proposed that this is a result of continuous exposure to a relatively stable background mixture, probably originating from fish consumption. Based on the congeneric patterns found in the Cormorant, polychlorinated biphenyls and pentachlorophenol are suggested as major contaminating sources for this species. Using results from the Cormorants, an open one compartment model was applied to estimate concentrations of 2,3,4,7,8-pentachlorodibenzofuran in the Eel. These calculations were in good agreement with the actual measurements found in the Eels. (Author's abstract)

LIBRARY U. OF I. URBANA-CHAMPAIGN

The concentrations of heavy metals in the livers of southern minke whales, B. acutorostrata, were determined by atomic absorption spectrophotometry, and their accumulation levels and variations were compared to food habit, and biological parameters. The concentration levels and bioconcentration factors of metals in the minke whale were relatively high for iron (Fe) and cadmium (Cd) and low for mercury (Hg), when compared to seals and small-toothed cetaceans from different waters. For most of the metals examined, the concentrations were log-normally distributed. The concentrations of Fe, Cd, and Hg were positively correlated with age, but a correlation was not observed for the other metals. While the hepatic Fe concentration linearly increased with age, the concentrations of Cd and Hg increased up to the age of about 20 years and thereafter decreased year by year. Such unusual age trends of Cd and Hg are considered to be due to recent changes in the amount of food intake by the minke whale, as a result of structural disturbances in the Antarctic marine ecosystem due to commercial whaling. Also, the hepatic concentrations of metals varied between sexes, and with reproductive status of the matured female; the concentration of Fe was lower in females than males, and Fe, Pb, Ni, and Co concentrations in matured females decreased with progress of gestation. Descriptors: *Alaska, *Drilling fluids, *Fish, *Invertebrates, *Oil pollution, *Path of pollutants, *Toxicity, *Tundra, *Wastewater pollution, *Water pollution effects, *Wetlands, Aquatic habitats, Arctic, Bioassay, Chemical analysis, Daphnia, Hydrocarbons, Population exposure, Sediment analysis.

Drilling for oil on the North Slope of Alaska results in the release of large volumes of used drilling fluids into arctic wetlands. These releases, usually come from regulated discharges or seepage from reserve pits constructed to hold used drilling fluids. A study of five drill sites and their reserve pits showed an increase in common and trace elements and organic hydrocarbons in ponds near to and distant from reserve pits. Ions elevated in water were barium, chlorine, chromium, potassium, sulfate, and zinc. Concentrations of copper, chromium, iron, lead and silicon in sediments were higher in near and distant ponds than in control ponds. The predominant organics in drill site waters and sediments consisted of aromatic and paraffinic hydrocarbons characteristic of petroleum or a refined product of petroleum. In 96-hour exposures in the field, toxicity to Daphnia Middendorffiana was observed in water from all reserve pits, and from two of five near ponds, but not from distant ponds. In laboratory tests with Daphnia magna, growth and reproduction were reduced in dilutions of 2.5% drilling fluid (2.5 drilling fluid: 97.5 dilution water) from one reserve pit, and 25% drilling fluid from a second. Growth and reproduction were not affected at these dilutions of fluid from the other three reserve pits. Additional regulations--such as an upper limit on aromatic hydrocarbon content and toxicity to sensitive organisms--are needed to improve safety for aquatic organisms in habitats receiving used drilling fluids. INFLUENCE OF TEMPERATURE AND ORGANIC AMENDMENTS ON THE MOBILIZATION OF SELENIUM IN SEDIMENTS.
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
S. J. Calderone, W. T. Frankenberger, D. R. Parker, and U. Karlson.
Soil Biology & Biochemistry SBIOAH, Vol. 22, No. 5, p 615-620, 1990. 6 fig, 3 tab, 25 ref.

Descriptors: *Kesterson Reservoir, *Leaching, *Path of pollutants, *Reservoir sediments, *Sediment contamination, *Selenium, California, Detoxification, Heavy metals, Kinetics, Manure, Proteins, Sediment analysis, Temperature effects, Volatility.

Toxic amounts of selenium have been found in sediments and water at Kesterson Reservoir (Merced County, CA). A sediment column study was established for determination of Se volatilization potential and k Se volatilization rate coefficient derived from a first-order kinetics model. Increasing the temperature from 15 to 35 C promoted volatilization of Se. The amount of Se leached out of the sediments was independent of the initial total Se inventory. Volatilization of Se followed a first-order reaction and was highly dependent on initial Se concentration. The Se volatilization potential ranged from 0.18 to 3.63 mg Se/kg sediment with rate coefficents values ranging from 0.003 to 0.053/day. The addition of organic amendments promoted volatilization, with Se being less available for leaching. The application of gluten, a wheat storage protein, enhanced volatilization of Se (1.7 to 3.2-fold over the control) more strongly than other treatments (e.g. casein, orange peel and cattle manure). Volatilization may be an important dissipation mechanism for detoxification of seleniferous sediments. (Author's abstract)

TRANSPORT OF HEAVY METALS WITHIN A SMALL URBAN CATCHMENT.
Middlesex Polytechnic, Enfield (England). Urban Pollution Research Center.
D. M. Revitt, R. S. Hamilton, and R. S. Warren.
The Science of the Total Environment STENDL, Vol. 93, p 359-373, April 1990. 2 fig, 8 tab, 17 ref.

Descriptors: *Cadmium, *Copper, *Heavy metals, *Lead, *Model studies, *Path of pollutants, *Urban drainage, *Urban runoff, *Zinc, Air pollution, Deposition, Hydrologic models, Hydrology, Runoff, Storm runoff.

A small urban catchment has been monitored for levels of lead, zinc, cadmium and copper in the atmosphere, deposition, surface dust and stormwater runoff. The contribution of local emissions to total deposition was considered and found to be significant only for zinc. In rainfall, the metals are mainly associated with particulates. Wet deposition is more important than dry deposition for lead and zinc, but the processes are comparable for cadmium and copper. The percentage of the dissolved metal level in rainfall (which was observed in the storm runoff) varied from 92% for copper to 13% for lead. The mass of metal removed in runoff is the combined metal input by wet and dry deposition to the road and roof surface less that mass of metal which is: (1) adsorbed onto surface sediments; (2) retained by the gully pots; (3) retained in the roof guttering; (4) deposited in the underground drainage system; (5) lost through resuspension and dispersion; and (6) removed by street sweeping. The hydrologic characteristics of each storm event need to be accommodated for any predictive model of this type to be valuable. Even then, the result will be dependent on specific site characteristics. (Stoehr-PTT)

SUBSTANCE LOAD IN RAINWATER RUNOFF FROM DIFFERENT STREETS IN HAMBURG.
Hamburg Univ. (Germany, F.R.). Inst. fuer Anorganische und Angewandte Chemie.
W. Dannecker, M. Au, and H. Stechmann.
The Science of the Total Environment STENDL, Vol. 93, p 385-392, April 1990. 4 tab, 3 ref.

Descriptors: *Germany, *Hamburg, *Path of pollutants, *Storm runoff, *Urban runoff, *Water pollution sources, Antimony, Arsenic, Cadmium, Chromium, Copper, Heavy metals, Highway effects, Pollutant identification, Runoff, Surface runoff, Vanadium, Zinc.

Twenty-five substances were evaluated in runoff, and wet and bulk deposition samples from different sampling sites in Hamburg, Germany: (1) a street in an industrial area; (2) a thoroughfare; and (3) a small street in a residential area. The runoff from the industrial road and the main street showed similar levels of pollution. The surface water from the industrial area contained higher concentrations of arsenic, while the main street showed higher concentrations of lead, antimony and zinc. The runoff from the residential area was loaded substantially lower. Several elements, copper, chromium, and vanadium were found to be almost completely adsorbed to particles, but several more toxic elements, cadmium and copper, were found at a higher percentage in the soluble phase. POLLUTION OF STREET RUN-OFF BY TRAFFIC AND LOCAL CONDITIONS.
Umweltbundesamt, Berlin (Germany, F.R.).
W. Muschack.
The Science of the Total Environment STENDL, Vol. 93, p 419-431, April 1990. 6 tab, 12 ref.

Descriptors: *Highway effects, *Pollutant identification, *Urban runoff, *Water pollution sources, Chromium, Copper, Drinking water, Heavy metals, Hydrocarbons, Lead, Nickel, Path of pollutants, Precipitation, Rainwater, Runoff, Zinc.

Investigations were performed in the Federal Republic of Germany to determine pollutant concentrations in rainwater in order to obtain a comprehensive picture of the pollution caused by precipitation runoff. Influencing parameters included: exhaust gases, tire abrasion particles, brake lining abrasion dust, leakage of hydrocarbons, and winter street cleaning activities. The analysis of these factors was complemented by the determination of detection limits. After an assessment of all possibilities, 30 substances remained, and 22 were analyzed. Lead, chromium, copper, nickel, and zinc are the elements commonly found in the emissions/particles of the aforementioned parameters. (Stoehr-PTT)

HEAVY METAL ACCUMULATION AND TRANSPORT THROUGH DETENTION PONDS RECEIVING HIGHWAY RUNOFF.
University of Central Florida, Orlando. Dept. of Civil Engineering and Environmental Sciences.
Y. A. Yousef, T. Hvitved-Jacobsen, H. H. Harper, and L. Y. Lin.
The Science of the Total Environment STENDL, Vol. 93, p 433-440, April 1990. 2 fig, 3 tab, 10 ref.

Descriptors: *Heavy metals, *Highway effects, *Path of pollutants, *Settling basins, *Urban runoff, *Water pollution sources, Chemical analysis, Copper, Lead, Municipal wastewater, Nickel, Rainfall, Runoff, Sediments, Zinc.

Heavy metals in highway runoff entering detention and retention ponds are removed, and accumulate in the bottom sediments of these ponds. Removal efficiency is controlled by: particulate metal fraction; detention time in the pond; and physical, chemical and biological interactions. Ponds tested have been in operation for five to fifteen years. Sediment accumulation rates vary between 1 cm/yr to 4 cm/yr. Metal concentrations throughout the sediment show a rapid decline following an exponential decay; the majority of the metals are attenuated in the top 10 to 20 centimeters. This

relatively high concentration of metals in the top layer suggests that the majority of particulate metals may settle out quickly upon entering the pond. Also the metal content in the sediment is generally lower than required standards of metals in municipal wastewater sludges recommended for agricultural use (< 900 microgm of copper, 1000 microgm of lead, 100 microgm of nickel, and 1800 microgm zinc per gram dry weight sediments). The potential release of heavy metals from bottom sediments under pH values of 7.5 to 8.5, by changing the redox potential from strongly oxidized to strongly reduced conditions, is insignificant. But, lowering the pH to 5 may enhance the release of metals. Generally, the amount of metal released is a small proportion of the metal content in the sediments. Based on the United States Environmental Protection Agency Toxicity Characteristics Leaching Procedures (TCLP) tests, disposal of bottom sediments in sanitary landfills may be feasible. Additional research studies are in progress to confirm these conditions. (Stoehr-PTT)

OLLUTANTS ATTACHED TO PARTICLES ROM DRAINAGE AREAS.
arlsruhe Univ. (Germany, F.R.). Inst. fuer Siedngswasserwirtschaft.
. Xanthopoulos, and H. H. Hahn.
he Science of the Total Environment STENDL, ol. 93, p 441-448, April 1990. 1 fig, 3 tab, 8 ref.

escriptors: *Drainage area, *Heavy metals, *Parle size, *Path of pollutants, *Urban runoff, Water pollution sources, Drainage systems, Pollant load, Runoff, Storm runoff, Surface runoff, rban areas, Water pollution.

oxic substances, such as heavy metals or organic iority pollutants, are of particular interest to the llution of natural waters from urban areas. Preinary investigations at four different stations thin the Karlsruhe, Germany, drainage area indie that these substances may exist at high conntration levels. In particular, autumn falling ves cause solid concentrations of 1000-2000 mg pended solids/L. Observed metal concentrans (Pb, Zn, Cu, Cd) in Karlsruhe are at the top l of the spectrum reported so far. The dissolved l the particle-bound phases were examined sepaely after separation using a centrifuge. The low ncentrations in one fraction show that the exam- organic micropollutants (e.g. polycyclic aroic hydrocarbons, PAC) are predominantly ed to solids. The PAC (fluoranthene, benzoranthene, indeno-pyrene, benz-a-pyrene, and z-periylene) contents of the whole sample eed drinking water standards by a factor of 10. e PAC contents of the particles separated by trifuge correspond to the top end of concentras observed in sewage sludge. The polychlori- biphenyl (PCB) load of the total sample c. as clophen A60) is approximately 150 ng/L, does not exceed drinking water standards both individual substances and in total. Examination he pollutants among the various size fractions particulates confirmed that the fine fractions 8-0.2 mm) carry significantly higher loads. The se fraction (> 1 mm) is transported as bed in the sewer system. It is important for the ration of the drainage system, but plays only a or role in the transport of pollutants. The nd fraction (0.2-1 mm) is transported near the om of the sewer, and in times of low disges may sediment out. Since the pollutant load hese two fractions is small they have little ence on the transported amount of pollutants. third fraction (0.08-0.2 mm) is transported in ended form, and depending on the current conditions, occurs in either heterogeneous or ogeneous concentration profiles. The finer s (< 0.08 mm) move more simultaneously the stormwater runoff and are distributed ogeneously. The two latter fractions are most ive in explaining the transport of pollutants in atchment and drainage system. (Stoehr-PTT)

Descriptors: *Aliphatic hydrocarbons, *Hydrocarbons, *Path of pollutants, *Statistical analysis, *Urban runoff, *Water pollution sources, Frequency distribution, Madrid, Regression analysis, Runoff, Spain, Water sampling.

Hydrocarbon runoff data from Madrid, Spain, have been analyzed in order to determine the effect of time, area characteristics and water flow on the runoff concentration frequency distribution. In this study, aliphatic and aromatic hydrocarbon concentrations obtained from runoff sampling from different areas of Madrid at different times of the year were used. The cumulative frequency distributions of a number of the hydrocarbons are characterized as modal log-normal distributions. This statistical study indicates a linear expression which relates aliphatic hydrocarbons from natural anthropogenic origins, with aromatic hydrocarbons from anthropogenic origins. Basically, those found in this urban runoff have noxious and harmful effects on human health and the environment. Upon consideration (of the concentrations of hydrocarbons from the areas of Madrid with different characteristics, distinct traffic levels, and the varying seasons) this linear expression is very useful for determining these compounds whenever qualities of the city are the same. IRON AND MANGANESE GEOCHEMISTRY AND THE DISTRIBUTION OF 239, 240 PU AND 241 AM IN THE SEDIMENTS OF THE NORTH EAST IRISH SEA.
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Directorate of Fisheries Research.
S. J. Malcolm, P. J. Kershaw, N. J. Cromar, and L. Botham.
The Science of the Total Environment STENDL, Vol. 95, p 69-87, June 1990. 5 fig, 4 tab, 42 ref.

Descriptors: *Americium, *Geochemistry, *Heavy metals, *Irish Sea, *Iron, *Manganese, *Path of pollutants, *Plutonium, *Radioactive wastes, *Sediment contamination, *Sediment discharge, *Sediment distribution, Leaching, Nuclear powerplants, Sediment-water interfaces, Trace elements.

The geochemical cycling of iron and manganese within the seabed sediments of the northeast Irish Sea has been investigated in an attempt to learn more about the factors controlling the distribution and behavior of plutonium and americium released from the BNF plc nuclear fuel reprocessing plant at Sellafield, England. Enrichment of surface sediment with both iron and manganese results from active diagenetic redox behavior which produces characteristic interstitial water concentration profiles at particular sites. The shape of the interstitial water profiles is controlled by differences in the general bioturbation regimes at each site. This factor has been simulated in simple laboratory tank experiments. Evidence from selective chemical leaching suggests that 40 percent of the plutonium and 80 percent of the americium are associated with the operationally defined iron/manganese oxide phase. However, in the surface sediment there is no apparent correlation between either iron or manganese content and either the plutonium or americium concentrations determined by strong acid digestion of the samples. Fluxes of iron and manganese upward in sediment are similar to those measured at other nearshore sites and indicate a potential for oxide scavenging of trace elements at the sediment/water interface. The behavior of plutonium and americium has probably been dominated by general nonequilibrium conditions resulting from: the recent introduction of the plutonium and americium into the environment, the dominating effects of dispersion from the pipeline source, and the variation with time of the quantities discharged. MASS-BALANCE OF METALS AND IDENTIFICATION OF THEIR SOURCES IN BOTH RIVER AND FALLOUT FLUXES NEAR GDANSK BAY, BALTIC SEA.
Akademia Medyczna, Gdansk (Poland). Dept. of Analytical Chemistry.
P. Szefer.
The Science of the Total Environment STENDL, Vol. 95, p 131-139, June 1990. 2 tab, 28 ref.

Descriptors: *Estuaries, *Fallout, *Heavy metals, *Metals, *Path of pollutants, *Poland, *Rivers, Baltic Sea, Cadmium, Chemical analysis, Cobalt, Copper, Geomorphology, Lead, Manganese, Nickel, Particulate matter, Rainfall, Thorium, Uranium, Water pollution, Zinc.

Metals concentration data are utilized to estimate the total observed metal fluxes in estuarine water of the Vistula River and rain fallout near the coastal zone of Gdansk Bay. The flux ratio (FR) between the observed flux (F) and the theoretical flux (F sub t), as well as the enrichment factor (EF), were calculated for each metal in order to evaluate its origin in estuarine river water and rain fallout. The F sub t value was derived from the mean metal content in the earth's crust and the total quantity of weathered land material. Iron was used as the normalizing element because of the lack of aluminum data. The FR and F values were balanced, and are similar to the EF values for less-mobilized trace metals such as copper and thorium in the Vistula flux and thorium, uranium, manganese and nickel in rain fallout. For these metals no enrichment relative to iron is observed in particulate matter. Additional fluxes in both the river and atmospheric components were found for cadmium, lead, zinc, and copper. This may be due to the influence of natural sources or artificial sources such as pollution. Literature data indicate insignificant contributions of lead, cadmium, zinc and copper from these natural sources, hence it may be concluded that the four metals were of anthropogenic origin. (Author's abstract)

DISTRIBUTION OF ZINC, LEAD, CADMIUM AND COPPER BETWEEN DIFFERENT SIZE FRACTIONS OF SEDIMENTS I. THE LIMSKI KANAL (NORTH ADRIATIC SEA).
Institut Rudjer Boskovic, Zagreb (Yugoslavia). Center for Marine Research.
D. Martincic, Z. Kwokal, and M. Branica.
The Science of the Total Environment STENDL, Vol. 95, p 201-215, June 1990. 4 fig, 4 tab, 34 ref.

Descriptors: *Adriatic Sea, *Cadmium, *Geochemistry, *Heavy metals, *Lead, *Path of pollutants, *Sediment contamination, *Sediments, *Zinc, Carbonates, Clays, Correlation analysis, Organic matter, Particle size, Sediment distribution, Silt, Trace elements.

The grain size distribution of particles and their accumulation in surface sediments of the upper part of Limski Kanal were determined. At all sampling stations, the size fractions containing particles less than 20 micrometers (clay-silt fraction) were predominant, whereas the amount of coarser grains was less than 30%. The quantities of associated metals within these size fractions differed from one sampling station to another. In all sediments, the finest clay-silt fraction (less than 10

LIBRARY U. OF I. URBANA-CHAMPAIGN

micro meters) contained the high concentration of all metals. The pattern of association of metals with coarser fraction changed substantially between sediments, depending on their chemical characteristics. Generally, they contained amounts of incorporated metals similar to, or even higher than, those found in the clay-silt fraction. These observations are primarily attributed to the quantities of organic and biogenic carbonate. Metal distributions are significantly correlated with the organic material in the sediments. No general trends were observed in the spatial distribution of metals in the sediment less than 300 micro meters from the area studied. The temporal metal variations at some sampling sites coincided with temporal variations in the organic material contents. (See also W91-02010) (Stoehr-PTT)
W91-02009

DISTRIBUTION OF ZINC, LEAD, CADMIUM AND COPPER BETWEEN DIFFERENT SIZE FRACTIONS OF SEDIMENTS II. THE KRKA RIVER ESTUARY AND THE KORNATI ISLANDS (CENTRAL ADRIATIC SEA).
Institut Rudjer Boskovic, Zagreb (Yugoslavia). Center for Marine Research.
D. Martincic, Z. Kwokal, and M. Branica.
The Science of the Total Environment STENDL, Vol. 95, p 217-225, June 1990. 2 fig, 1 tab, 5 ref.

Descriptors: *Adriatic Sea, *Estuaries, *Geochemistry, *Heavy metals, *Path of pollutants, *Rivers, *Sediment contamination, *Sediment distribution, *Sediments, Cadmium, Clays, Copper, Industrial wastes, Lead, Particle size, Silt, Trace elements, Zinc.

The levels of zinc, cadmium, lead and copper in different grain size fractions of recent sediments, collected from the Krka River Estuary and the Kornati Islands during October 1983, were determined. The distributional patterns of these metals mainly depended on the textural characteristics of the sediment. The clay-silt size particles contained the highest amounts of zinc, cadmium and lead. Copper exhibited an irregular particle size distribution. In general, the contents of copper in different grain-size fractions and their distribution throughout the area seemed to be influenced by biological activities. In the coastal region, the concentrations of cadmium in the coarse particles appeared to coincide with the quantities of carbonate present in the sediments. A significant enrichment of lead was observed in the lower part of the Krka River Estuary and in coastal regions with intensive ship traffic. Sediment collected near an industrial waste outflow was found to be enriched with zinc, lead and copper of anthropogenic origin. (See also W91-02009) (Author's abstract)

PHTHALATE ESTERS IN RIVERS OF THE GREATER MANCHESTER AREA, U. K.
Obafemi Awolowo Univ., Ile-Ife (Nigeria). Dept. of Chemistry.
O. S. Fatoki, and F. Vernon.
The Science of the Total Environment STENDL, Vol. 95, p 227-232, June 1990. 1 fig, 1 tab, 17 ref.

Descriptors: *Effluents, *England, *Esters, *Industrial wastes, *Phthalate esters, *Rivers, *Water pollution sources, Chemical analysis, Gas chromatography, Mass spectrometry, Pollutants, Sewage, Wastewater, Water pollution.

Waters from the Rivers Irwell and Etherow and from the Prestwich sewage treatment plant effluent, Manchester, England were analyzed for the presence of phthalate esters using computer-assisted gas chromatography and mass spectrometry (GC and MS). Extraction was with CHCl3. Liquid chromatography clean up was used for compound separation. Several phthalate esters, such as diethyl, butyl-2-monopropyl, di-n-butyl, di-2-ethylhexyl and di-iso-octyl, were found to be present at 0.4 to 33.5 micro grams per liter. A study on uncontaminated waters was undertaken to establish blank levels. The results compare favorably with those reported elsewhere for rivers polluted with industrial chemicals. The occurrence of phthalate esters in Manchester rivers is consistent with the industrial activities of the city. Other probable sources include leaching from disposed plastic wastes. Levels of phthalate esters in the city sewage effluent were considerably lower than those in the Irwell. (Author's abstract)

PENTACHLOROPHENOL: ENVIRONMENTAL PARTITIONING AND HUMAN EXPOSURE.
Oak Ridge National Lab., TN. Office of Risk Analysis.
H. A. Hattemer-Frey, and C. C. Travis.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 482-489, July/August 1989. 7 tab, 56 ref.

Descriptors: *Bioaccumulation, *Biocides, *Food chains, *Human health, *Human population, *Mathematical models, *Path of pollutants, *Pentachlorophenol, *Public health, *Toxicity, Aquatic life, Equilibrium, Fugacity-food chain model, Soil contamination, Suspended sediments, Water pollution.

Pentachlorophenol (PCP) is used as a wood preservative and a biocide, and is toxic to humans. The Fugacity-Food Chain model estimates the concentration of a chemical in six media (air, water, soil, sediment, suspended sediment in water, and biota in water) and then uses those concentrations to predict the amount of chemical entering the food chain and the average daily intake by the general population. The model contains simplifying assumptions, but given the state of knowledge regarding the environmental transport of chemicals, fugacity models are considered acceptable for exploring the equilibrium partitioning and environmental behavior of organic chemicals. Input parameters required to predict the cross-media partitioning of a chemical include its physicochemical and biochemical properties, bioconcentration/biotransfer factors, estimates of emission rates for the compound into air, water, and soil; and estimates of degradation rate coefficients for reactions that remove the compound from the system. Environmental concentrations of PCP were used to estimate the amount of PCP entering the food chain and the long term, average daily intake of PCP by the general population of the United States. Results show that PCP partitions mainly into soil (96.5%) and that the food chain, especially fruits, vegetables, and grains, accounts for 99.9% of human exposure to PCP. The long term, average daily intake of PCP is estimated to be 16 microg/day, which agrees well with previous estimates of 19 microg per day. (Brunone-PTT)

RAPID DISSIPATION OF GLYPHOSATE IN SMALL FOREST PONDS.
Alberta Univ., Edmonton. Dept. of Botany.
L. G. Goldsborough, and A. E. Beck.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 537-544, July/August 1989. 3 fig, 6 tab, 27 ref.

Descriptors: *Biodegradation, *Fate of pollutants, *Glyphosate, *Herbicides, *Path of pollutants, *Ponds, *Toxicity, Metabolites, Sediment contamination, Water chemistry, Water pollution.

Glyphosate, a broad spectrum herbicide, was applied to the water surface of four small boreal forest ponds and six in situ microcosms at a rate of 0.89 kg a.i./ha. Water samples collected over a period of up to 255 days were analyzed for glyphosate and its primary metabolite aminomethylphosphonic acid (AMPA). Glyphosate dissipated rapidly from all ponds, with first order half-lives ranging from 1.5 to 3.5 days. The slowest dissipation rate occurred in the pond with the most calcareous water and sediments. Glyphosate remained at or above the treatment concentration in microcosms containing only water but decreased rapidly in the presence of sediments. AMPA levels in ponds and microcosms were consistently low. Concentrations on microcosm wall samples were temporally variable, probably as a result of adsorption to periphytic biofilms. Glyphosate in the sediments of treated microcosms generally increased with time during the period of observation. These results confirm that glyphosate dissipates rapidly from the surface waters of lentic systems, and suggest that sediment absorption or biodegradation were the major means of glyphosate loss from the water column. These results suggest that effects of glyphosate contamination in water will be minimal, although further work is needed to evaluate possible long term toxicological effects. (Author's abstract)

EFFECTS OF CADMIUM ON MUREX TRUNCULUS FROM THE ADRIATIC SEA: I. ACCUMULATION OF METAL AND BINDING TO A METALLOTHIONEIN-LIKE PROTEIN.
Innsbruck Univ. (Austria). Inst. fuer Zoologie.
R. Dallinger, E. Carpene, G. J. Dalla Via, and P. Cortesi.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 554-561, July/August 1989. 4 fig, 3 tab, 35 ref. Fonds zar Foerderung der Wessenschaftlichen Forschung, Austria, Project No. P5962.

Descriptors: *Adriatic Sea, *Bioaccumulation, *Cadmium, *Heavy metals, *Metallothioneins, *Mollusks, *Toxicity, *Toxicology, *Water pollution effects, Amino acids, Gel chromatography, Ion exchange chromatography, Molecular structure, Snails, Tissue analysis, Zinc.

Individuals of Murex trunculus from the Adriatic Sea were exposed in the laboratory to cadmium under chronic conditions (0.05 mg/L, up to 30 days). Cadmium contents in the soft parts of the snails increased considerably, the highest concentrations occurring in combined hepatopancreas and kidney tissues. However, high amounts of cadmium were also found in unexposed individuals. No significant changes were observed in the concentrations of zinc. Cytosolic fractions of hepatopancreas and kidney organs were separated by gel and ion exchange chromatography. Variable amounts of cadmium were associated with components with a molecular weight of more than 75000 Daltons. Most of the metal, however, was bound to a protein with an apparent molecular weight of 11000 Daltons. This protein showed low absorption at 280 and a higher one at 254 nm. Amino acid composition revealed high amounts of cysteine (26%), lack of tyrosine, but presence of phenylalanine (4%). On the basis of these features, the protein was identified as a metallothionein-like protein. With increased exposure time, cadmium replaced zinc from this protein with zinc moving towards fractions with a molecular weight of less than 3000 Daltons. Moreover, a spillover effect was observed: the cadmium content of the metallothionein-like protein increased up to a saturation point beyond which excess cadmium was bound to high molecular weight components. SHELL AS A SITE OF LEAD DEPOSITION IN HELIX ASPERSA.
Polytechnic of the South Bank, London (England). Dept. of Biotechnology.
A. Beeby, and L. Richmond.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 623-628, July/August 1989. 3 fig, 2 tab, 25 ref.

Descriptors: *Bioaccumulation, *Heavy metals, *Lead, *Mollusks, *Path of pollutants, *Toxicity, Calcium, Magnesium, Metabolism, Shells, Snails.

Snails from a contaminated urban car park were fed an experimental diet for 64 days. One group received a high lead diet for the duration, and another group was removed from the high lead diet after two days. Shells were analyzed at various intervals to measure lead uptake and loss. Regression analysis of twenty eight shells for each treatment suggests that the weight of lead in the shell increased linearly with time, but loss from the shell was correlated with soft tissue lead levels. The shells of fourteen snails from an uncontaminated site accumulated lead less quickly on the high lead diet and had lower magnesium and calcium concentrations. All snails lost magnesium from the shell following the initial dose, possibly as part of the detoxification mechanism for heavy metals. The shell may lose lead over a number of days, serving as a short term sink for lead which it releases when soft tissue concentrations fall. (Author's abstract)

GEOGRAPHIC VARIATION OF CHLORINATED HYDROCARBONS IN BURBOT (LOTA LOTA) FROM REMOTE LAKES AND RIVERS IN CANADA.
Department of Fisheries and Oceans, Winnipeg (Manitoba). Central and Arctic Region.
C. G. Muir, C. A. Ford, N. P. Grift, D. A. Metner, and W. L. Lockhart.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 530-542, July/August 1990. 6 fig, 6 tab, 42 ref.

Descriptors: *Bioaccumulation, *Canada, *Chlorinated aromatic compounds, *Fish, *Halogenated pesticides, *Hydrocarbons, *Lakes, *Path of pollutants, *Pesticides, *Polychlorinated biphenyls, Ecosystems, Fate of pollutants, Rivers, Water chemistry, Water pollution.

The variation in levels of polychlorinated biphenyls (PCBs), chlorobenzenes and chlorinated pesticides was studied in burbot (Lota lota) from eight remote locations along a northwesterly transect from northwestern Ontario to the Mackenzie River area in Canada. Significant declines in concentrations of PCB congeners, DDT isomers, lindane, dieldrin, and mirex in burbot liver were found with increasing north latitude. Mean PCB concentrations ranged from 1290 ng/g (lipid wt) at Lake Opeongo, a remote lake in northwestern Ontario, to 301 ng/g in samples from the Mackenzie River at Arctic Red River, Northwest Territories. No significant differences in mean concentrations of toxaphene, alpha-HCH(BHC), trichlorobiphenyls, and tetrachlorobiphenyls were observed between southern and northern sampling sites. Toxaphene was the predominant organochlorine residue in northern fish samples averaging 1400 ng/g (lipid wt) at the three most northerly sites and 1723 ng/g at Lake 625. Airborne contamination was the only major source of organochlorines for most of the locations surveyed. The results were consistent with the hypothesis that inputs of semi-volatile organochlorines to northern aquatic ecosystems increase with increasing north latitude and distance from North American sources. EFFECTS OF XAD-8 FRACTIONS OF DISSOLVED ORGANIC CARBON ON THE SORPTION AND BIOAVAILABILITY OF ORGANIC MICROPOLLUTANTS.
Joensuu Univ. (Finland). Dept. of Biology.
J. Kukkonen, J. F. McCarthy, and A. Oikari.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 551-557, July/August 1990. 3 fig, 3 tab, 23 ref. US DOE Contract DE-AC05-84OR21400.

Descriptors: *Adsorption, *Bioavailability, *Chromatography, *Organic carbon, *Path of pollutants, *Polycyclic aromatic hydrocarbons, *Water pollution, Bioaccumulation, Daphnia, Fate of pollutants, Ion exchange, Polychlorinated biphenyls, Waterfleas.

The dissolved organic carbon (DOC) from a stream water near a peat deposit was fractionated into hydrophobic-acid (HbA), hydrophobic-neutral (HbN) and hydrophilic (Hl) subcomponents by XAD-8 chromatography. The capacity of these fractions and the total (unfractionated) water to bind hydrophobic organic contaminants was measured by equilibrium dialysis, and the effect of binding on contaminant bioavailability was measured in Daphnia magna. Model contaminants were the polycyclic aromatic hydrocarbons, naphthalene (NPH) and benzo(a)pyrene (BaP), and the polychlorinated biphenyl, 2,2',5,5'-tetrachlorobiphenyl (TCB). Both BaP and TCB exhibited high partition coefficients for binding to both the total DOC and the hydrophobic components of the DOC. BaP had a higher affinity for binding to the HbA fraction, while TCB (and three other PCB's) had higher affinity for the HbN fraction. The partition coefficients for binding to the Hl fraction were twofold to tenfold lower than for binding to the hydrophobic fraction. The less hydrophobic compound, NPH, had a much lower partition coefficient, and little difference was seen between the fractions. The total water and the different DOC fractions reduced the uptake and accumulation of BaP and TCB by D. magna in proportion to the capacity of the DOC for binding the contaminants. Data were consistent with the hypothesis that a contaminant bound to DOC (total water or any of the fractions) is unavailable for uptake by biota. Uptake of NPH was not substantially affected by the DOC, consistent with its lower partition coefficient. (Author's abstract)

PARTITIONING OF LINDANE BETWEEN SEDIMENT, WATER AND THE CRUSTACEAN METAPENAEUS MACLEAYI.
Griffith Univ., Nathan (Australia). School of Australian Environmental Studies.
A. C. Just, D. W. Hawker, and D. W. Connell.
Australian Journal of Marine and Freshwater Research AJMFA4, Vol. 41, No. 3, p 389-397, 1990. 3 fig, 1 tab, 21 ref.

Descriptors: *Bioaccumulation, *Crustaceans, *Halogenated pesticides, *Lindane, *Path of pollutants, *Sediment chemistry, *Sediment pollution, *Soil water pollution, *Water chemistry, Equilibrium, Organic carbon, Partitioning, Shrimp, Uptake.

The partitioning behavior of lindane between sediment, water and the shrimp Metapenaeus macleayi was investigated. The sediment-to-water partition coefficient was determined with sealed glass vials in laboratory experiments and found to be 9.52 or 2164 on an organic carbon basis. This result is in agreement with relevant literature data and confirms that the organic matter of the sediment is the primary sorption site in this process. The bioconcentration factor was evaluated from laboratory experiments with shrimps in sealed glass jars in which the lindane seawater solution was changed frequently. Under these conditions, effective equilibrium was attained after 24 hours. Measured uptake and clearance rate constants were smaller than predicted on the basis of existing general relationships between measured uptake, clearance rate, and the octanol/water partition coefficient for crustaceans. The bioconcentration factor was found to be 5.50, or 1273 on a lipid basis, which is also smaller than values estimated from general relationships. The sediment-to-prawn bioaccumulation factor was 0.58, which means that biotic concentrations will be significantly less than those observed in sediments. (Author's abstract)

OUTBREAK OF PONTIAC FEVER DUE TO LEGIONELLA ANISA.
Santa Clara County Health Dept., San Jose, CA.
M. D. Fenstersheib, M. Miller, C. Diggins, S. Liska, and L. Detwiler.
Lancet LANAAI, Vol. 336, No. 8706, p 35-37, July 1990. 1 tab, 8 ref.

Descriptors: *Aerosols, *California, *Human diseases, *Legionella, *Public health, *Water pollution effects, Disinfection, Epidemiology, Infectious diseases, Microbiological studies, Pontiac fever, Water pollution sources, Water treatment.

An outbreak of Pontiac fever occurred among 34 of 56 people attending conferences at a hotel in Santa Clara County, California, in 1988. Two groups had an acute febrile upper respiratory illness, with a mean attack rate of 82% and a mean incubation period of 56 hours. Symptoms resolved spontaneously within 5 days. Legionella anisa, which had not previously been associated with outbreaks of Pontiac fever or legionnaires' disease, was isolated from a decorative fountain in the hotel lobby. In addition, 5 of 8 pairs of serum samples from cases showed a more than four-fold rise in antibody titer to the L. anisa recovered from the fountain. 42% of the hotel employees had titers greater than or equal to 256 against L. anisa, whereas none of 48 serum samples from matched controls had titers greater than or equal to 128. The findings raise concern about water treatment protocols for extent of disease that might be caused by exposure to aerosols containing L. anisa and other Legionella species. (Author's abstract)

ALDICARB FOOD POISONINGS IN CALIFORNIA, 1985-1988: TOXICITY ESTIMATES FOR HUMANS.
California Dept. of Health Services, Emeryville. Environmental Epidemiology and Toxicology Branch.
L. R. Goldman, M. Beller, and R. J. Jackson.
Archives of Environmental Health AEHLAU, Vol. 45, No. 3, p , May/June 1990. p 141-147, 2 fig, 2 tab, 17 ref.

Descriptors: *Aldicarb, *California, *Public health, *Toxicity, *Water pollution effects, Agriculture, Cucumbers, Insecticides, Lethal limit, Watermelon.

Three outbreaks of food poisoning involving watermelons or cucumbers, and caused by the carbamate pesticide aldicarb, occurred in California between 1985 and 1988. For each outbreak, and for an outbreak of aldicarb poisoning associated with English cucumbers previously reported in the literature, dosages of aldicarb sulfoxide that caused the illness were estimated. Estimated dosages ranged between 0.0011 and 0.06 mg/kg body weight, and most were well below the 0.025 mg/kg Lowest Observed Effect Level (LOEL) for subclinical blood cholinesterase depression previously reported for humans. These findings are consistent with aldicarb sulfoxide (ASO) illnesses that have occurred in other states. Aldicarb appears to be more toxic than previously suspected. Scientific and regulatory implications are examined. (Author's abstract)

PHYSIOLOGICAL RESPONSE OF YELLOW-POPLAR SEEDLINGS TO SIMULATED ACID RAIN, OZONE FUMIGATION, AND DROUGHT.
Agricultural Research Service, Delaware, OH.
B. Roberts.
Forest Ecology and Management FECMDW, Vol. 31, No. 4, p 215-224, April 1990. 2 fig, 1 tab, 25 ref.

Descriptors: *Acid rain, *Drought, *Ozone, *Poplar trees, *Seedlings, *Water pollution effects, Air pollution, Hydrogen ion concentration, Photosynthesis, Plant physiology, Simulation analysis, Water deficity.

One year old containerized seedlings of yellow poplar (Liriodendron tulipifera L.) were exposed to simulated acid rain (pH 3.0, 4.0, 5.5), ozone (O3) fumigation (0, o.o5, 0.1, 0.2 ppm), and drought (1,2, or 3 one-week drying cycles) from late May until mid-October. Measurements of net photosynthesis (P), leaf stomatal conductance (G) and xylem water-potential (Z) were made on seedlings from each treatment during June, July and August. Seedlings treated with simulated acid rain at pH 3.0 showed reductions in P (29%), G (33%) and Z (17%) when compared with similar seedlings treated with simulated acid rain with pH 5.5. For seedlings fumigated with ozone, there were no significant differences in P or G between the controls and the other ozone treatments. For seedlings subjected to drought, P increased with increasing stress but Z declined. Interactions involving drought and ozone together had a greater impact on Z than either factor alone. For certain stress combinations, particularly those involving drought, it appears that one factor may exert a dominant role over another in determining the overall physiological response. (Author's abstract)

TOXICOLOGY OF CHEMICAL MIXTURES: EXPERIMENTAL APPROACHES, UNDERLYING CONCEPTS, AND SOME RESULTS.
National Toxicology Program, Research Triangle Park, NC.
R. S. H. Yang, H. L. Hong, and G. A. Boorman.
Toxicology Letters TOLED5, Vol. 49, No. 2/3, p 183-197, December 1989. 7 tab, 18 ref.

Descriptors: *Chemical analysis, *Toxicology, *Water pollution effects, Denver, Hazardous wastes, Lake Ontario, Love Canal, New York, Public health, Salmon, Sediment contamination, Waste disposal.

The toxicology of chemical mixtures reflects an actual human exposure situation, yet there is no standard protocol or consensus methodology for investigating the toxicology of mixtures. Thus, experimentation is required just to develop a broadly applicable evaluation system. Several examples are illustrated to present the different experimental designs and the concepts behind each. These include the health effects studies of Love Canal soil samples, the Lake Ontario Coho salmon, the water samples repurified from secondary sewage in the City of Denver Potable Water Reuse Demonstration Plant, and the National Toxicology Program (NTP) effort on a mixture of 25 frequently detected groundwater contaminants derived from hazardous waste disposal sites. In the last instance, an extensive research program has been ongoing for the last two years at the NTP, encompassing general toxicology, biochemical toxicology, myelotoxicology, genetic toxicology, neuro-behavioral toxicology, and hepato-, and renal toxicology. HOUSEHOLD EXPOSURE MODELS.
Lawrence Livermore National Lab., CA. Environmental Sciences Div.
T. E. McKone.
Toxicology Letters TOLED5, Vol. 49, No. 2/3, p 321-339, December 1989. 1 fig, 7 tab, 25 ref.

Descriptors: *Drinking water, *Model studies, *Volatile organic compounds, *Water pollution effects, Air pollution, Potable water, Public health.

Human exposure to volatile organic compounds (VOCs) in tap water is often assumed to be dominated by ingestion of drinking water. The relative importance of inhalation and dermal exposure in a typical household was studied using a three-compartment model to simulate the 24-h concentration history of VOCs in the shower, bathroom and remaining household volumes as a result of tap water use. Mass transfers from water to air are derived from measured data for radon and used to estimate mass transfer properties for VOCs. The model is used to calculate a range of concentrations and human exposures in U.S. dwellings. The estimated estimate of household-inhalation uptake to ingestion uptake is in the range of 1-6 for VOCs. A dermal absorption model is used to assess exposure across the skin boundary during baths and showers. The ratio of dermal exposure to ingestion exposure is in the range of 0.6 to 1. Inhalation of volatile chemicals transported from potable water supplies to indoor air has the potential for being as important as, or more important than, the direct ingestion of these compounds as a route of exposure from potable water supplies. The dermal absorption of chemicals from bath and shower water is based on limited data defining the permeability of the skin to chemical transport. (Lantz-PTT)

EFFECTS OF LAKE ACIDIFICATION ON AQUATIC MACROPHYTES--A REVIEW.
Imperial Coll. at Silwood Park, Sunninghill (England). Dept. of Biology.
A. M. Farmer.
Environmental Pollution ENPOEK, Vol. 65, No. 3, p 219-240, 1990. 2 tab, 94 ref.

Descriptors: *Acid rain effects, *Aquatic plants, *Lake acidification, *Literature review, *Water pollution effects, Ammonium, Competition, Ecosystems, Hydrogen ion concentration, Macrophytes, Nitrates, Physiological ecology, Plant nutrients, Plant physiology, Species composition.

Acidification of lakes results in a number of chemical, physical and biological changes. With lake acidification, different communities of freshwater macrophytes arise, in response to the pH change. The studies often emphasize the replacement of calcicole species and others such as the isoetids with Juncus bulbosus and Sphagnum spp. in acidifying lakes. Various alterations in lake conditions affect the physiology of the macrophytes, particularly with changes in the availability of carbon, a change from nitrate to ammonium as a nitrogen source and the effects of an alteration in the lake light climate. It is very unlikely that the responses of one species will be the same in all parts of a lake. The population biology, community ecology and ecosystem functioning of macrophytes show that sometimes competitive processes may seem more important in determining community change than physiological processes. It is important to undertake experimental studies at the correct scale to determine which factors may be causally related to the floristic evidence. (Author's abstract)

Environmental Pollution ENPOEK, Vol. 65, No. 3, p 251-267, 1990. 7 fig, 3 tab, 28 ref.

Descriptors: *Heavy metals, *Metal-finishing wastes, *Path of pollutants, *Stream pollution, *Synergistic effects, *Toxicity, *Water pollution effects, Cadmium, Copper, Dilution, Effluents, Electroplating, Hazard assessment, Mineralization, Nickel, Organic matter, Principal component analysis, Protozoa, Water chemistry, Zinc.

A copper-cadmium-nickel-zinc mixture was assessed in seven different river waters to study metal toxicity to the ciliate protozoan Colpidium campylum, the interactions occurring between metals, and the influence of the receiving water on toxicity. In the range of concentrations tested which is representative of electroplating industry wastes, the main part of the toxicity can be attributed to copper and to copper-cadmium synergy. A

classification of waters, based on a principal component analysis (PCA), was used to examine the main parameters of the water, which can affect the toxicity of metal mixtures. The mineralization of the water, more than the total organic matter, appears to be an important parameter for the expression of toxicity. A strategy for the estimation of ecotoxicological hazard assessment, based upon a simplified factorial experiment enables the study of the toxicity of an effluent, the influence of river water on its toxicity, and the effects of contact time and dilution in a two-step bioassay. By applying PCA to data from very different waters, it may be possible to estimate the ecotoxicological risk associated with the discharge of an effluent, on the basis of the chemistry of the receiving water. GREEN OYSTERS CAUSED BY COPPER POLLUTION ON THE TAIWAN COAST.
National Taiwan Univ., Taipei. Inst. of Oceanography.
B. Han, and T. Hung.
Environmental Pollution ENPOEK, Vol. 65, No. 4, p 347-362, 1990. 4 fig, 6 tab, 35 ref.

Descriptors: *Bioaccumulation, *Copper, *Oysters, *Path of pollutants, *Taiwan, *Water pollution effects, Aquaculture, Heavy metals, Marine pollution, Shellfish.

The first case of green oysters (Crassostrea gigas) broke out along the Charting mariculture area of southwestern Taiwan in January, 1986. The green color was found to be due to high copper content in the oyster tissue. Since then, a long-term survey around this area shows that total dissolved copper ranges from 4.99 to 23.6 microg/L and particulate copper ranges from 1.09 to 5.51 microg/L in sea water. The green oysters collected from the Erjhin Chi estuary on January 26, 1989 gave the highest copper content, 4401 plus or minus 79 ppm dry weight. Other green oyster cases were occasionally observed in the Hsiangsan and Anpin mariculture areas. Meanwhile, an experiment of copper accumulation in oysters was conducted at three stations (southwestern Taiwan) for up to 90 days. Multiple regression analysis indicates that the food pathway may predominate in copper accumulation by green oysters. This bioaccumulation experiment shows that the total uptake of copper per oyster is an exponential function of exposure time for the first two weeks with an accumulation rate of 214 ppm copper/day and then levels off. The average values of concentration factors for oysters (about 10,000) were very close to steady-state values under the natural conditions at each station. (Author's abstract)
W91-01108

EFFECTS OF ACIDIC IRRIGATION ON SOIL MICROORGANISMS AT KEVO, NORTHERN FINLAND.
Turku Univ. (Finland). Dept. of Biology.
M. Kytoviita, H. Fritze, and S. Neuvonen.
Environmental Pollution ENPOEK, Vol. 66, No. 1, p 21-31, 1990. 1 fig, 4 tab, 26 ref.

Descriptors: *Acid rain effects, *Finland, *Simulated rainfall, *Soil organics, *Water pollution effects, Acid rain, Bacterial physiology, Litter, Microorganisms, Soil bacteria, Soil fungi.

Increasing rates of pollution in the northern hemisphere have led to a large number of studies concerning different aspects of acidification. Effects of simulated acid rain (a mixture of sulfuric acid and nitric acid; pH 3) on soil microbiology were studied in a field experiment in northern Finland. Irrigated control plots received the same amount of spring water (pH 6) as the acid treated plots. Fungal lengths and total bacterial numbers were studied after the treatments had continued for three growing seasons. The numbers of bacteria in five physiological groups (those utilizing starch, protein, pectin, xylan, or cellulose) were measured by most probable number (MPN) techniques. The lengths of total and FDA stained fungal hyphae were not significantly different between the acid treated and the control plots. The counts of total bacteria were not significantly different between treatments, but the MPNs of all five physiological groups of bacteria were approximately 60% lower in the acid treated plots than in the controls. The results of the present study suggest that changes in soil microbial activity caused by moderate acidification may be important in a long term perspective and a reduction in the amounts of bacteria utilizing cellulose, starch, pectin, xylan and protein may at least partially explain the lower mass loss of litter on acid treated soils. (Brunone-PTT)
W91-01109

BIOACCUMULATION AND TOXICITY OF ZINC IN THE GREEN ALGA, CLADOPHORA GLOMERATA.
Polytechnic of Central London (England). Applied Ecology Research Group.
B. M. McHardy, and J. J. George.
Environmental Pollution ENPOEK, Vol. 66, No. 1, p 55-66, 1990. 4 fig, 2 tab, 24 ref.

Descriptors: *Algae, *Bioaccumulation, *Chlorophyta, *Toxicity, *Water pollution effects, *Zinc, Algal growth, Aquatic plants, England, Path of pollutants, Plant physiology.

The bioaccumulation and toxicity of zinc in Cladophora glomerata from two populations in the River Roding, Essex, UK, were examined in experimental laboratory flowing-water channels. Plants were subjected to concentrations ranging from 0 to 4.0 mg/L at current velocities of 20 to 33 cm/sec for up to three hours. Zinc in algal tissue was then quantified and toxicity was assessed by the ability of the alga to grow in a recovery medium after the experimental treatment. There was little difference in zinc bioaccumulation between Cladophora from the site showing mild organic pollution and that from the site subjected to considerable inputs from urban and motorway runoff. Uptake of zinc increased with increasing concentration in the test solution and was linear and proportional up to 0.4 mg/L. Three stages of uptake were identified with the most dramatic accumulation occurring in the first ten minutes. Experimental concentration factors ranged from 1900 to 5200, which were in agreement with those previously obtained in the field. Cellular damage was evident in Cladophora subjected to 0.4 mg/L zinc and this increased with increasing zinc concentration, thus leading to the conclusion that, at times, the levels of zinc found in the river could be potentially damaging. (Author's abstract)
W91-01111

MOLLUSC THAIS HAEMASTOMA - AN EXHIBITOR OF 'IMPOSEX' AND POTENTIAL BIOLOGICAL INDICATOR OF TRIBUTYLTIN POLLUTION.
Liverpool Univ., Port Erin (England). Dept. of Marine Biology.
S. K. Spence, S. J. Hawkins, and R. S. Santos.
Marine Ecology (PSZNI) MAECDR, Vol. 11, No. 2, p 147-156, 1990. 5 fig, 1 tab, 22 ref.

Descriptors: *Antifoulants, *Bioindicators, *Gastropods, *Imposex, *Mollusks, *Organotin compounds, *Water pollution effects, Animal physiology, Aquatic animals, Azores, Bioaccumulation, Marine pollution, Tributyltin.

In the Azores, the gastropod Thais haemastoma shows varying degrees of imposex, the induction of male sex characters in the female. It is inferred that imposex in T. haemastoma is caused by tributyltin (TBT) associated with boats using organotin-based antifoulant paints. The two indices (relative penis size and vas deferens sequence) employed previously for Nucella lapillus, were used without alteration. T. haemastoma is only the third species reported as exhibiting 'effective sterilization' of the female. Unlike N. lapillus, T. haemastoma has a planktonic larva, allowing populations to be sustained even when local TBT pollution is high. This makes T. haemastoma potentially a better indicator species, as monitored populations can be maintained by the influx of larvae. T. haemastoma may thus provide a cheap method of assessing the extent of TBT contamination in warm waters, particularly in the Mediterranean and Atlantic Islands. Preliminary examination of material from a marina in Spain showed a high incidence of 'sterile' animals. (Author's abstract)

EFFECT OF MERCURY AND SELENIUM ON THE GILL FUNCTION OF MYTILUS EDULIS.
University Coll. of Swansea (Wales). Dept. of Earth Sciences.
S. Micallef, and P. A. Tyler.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 288-292, June 1990. 2 fig, 1 tab, 34 ref.

Descriptors: *Bioindicators, *Mercury, *Mussels, *Selenium, *Water pollution effects, Gills, Heavy metals, Marine pollution, Mytilus, Toxicity.

The effect of selenium and mercury on the filtration, oxygen consumption, and associated processes of ciliary activity of Mytilus edulis was studied. Mussels were exposed to mercury (50 microgram Hg/L) and selenium (50 microgram Se/L) or to a combination of mercury (50 microgram Hg/L) and selenium in an equidosal (50 microgram Se/l) or an equimolar (19.7 microgram Se/L) ratio for 120 hours. The filtration rate in mussels exposed to mercury and combined treatments was severely affected within 2 hours. Mussels exposed to selenium showed a reduced filtration rate intermediate between the controls and the other treatments. The effect of the individual and combined treatments on ciliary activity was transient, while the effect on oxygen consumption was not significant. Under these laboratory conditions selenium in its reduced chemical form failed to protect mussels against mercury toxicity. (Author's abstract)

IS IT POSSIBLE TO REGAIN AN ECOLOGICAL BALANCE IN A LAKE WITH BLOOMS OF NUISANCE MICROORGANISMS.
National Inst. of Public Health, Oslo (Norway). Dept. of Water and Hygiene.
H. C. Utkilen.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 205-209, 3 fig, 1 tab, 12 ref.

Descriptors: *Algal blooms, *Cyanophyta, *Eutrophication, *Lake restoration, *Phosphorus, *Water pollution control, *Water pollution treatment, Algal growth, Aquatic bacteria.

Cyanobacteria (blue-green algae) blooms can cause several problems in a water source, rendering it less suitable for drinking or recreational purposes. Such problems occurred in the Norwegian lake Mjosa, where a bloom of Oscillatoria bornetii f. tenuis produced the off-flavor component geosmin. This resulted in an attempt to stop and reverse the ongoing eutrophication by decreasing the phosphorus loading to the lake. The plan which included building new sewage treatment plants, banning the use of phosphorus-containing detergents, and reducing agricultural runoff to the lake was initiated in 1976 and lasted until 1981. During this period the theoretical phosphorus loading of the lake was reduced from 380 ton/yr to 220 ton/yr. From 1979, the cyanobacteria level was negligible. However, after 1981 the phosphorus concentration in the lake increased again and larger amounts of cyanobacteria causing problems reappeared. The experience from lake Mjosa therefore shows that it is possible to stop and even reverse eutrophication, but the effort to reverse pollution has to be an ongoing process. WELL-WATER METHAEMOGLOBINAEMIA: THE BACTERIAL FACTOR.
Norsk Hydro, Porsgrunn. Research Centre.
O. C. Cockman, and D. D. Bryson.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 239-244, 15 ref.

Descriptors: *Drinking water, *Enteric bacteria, *Human diseases, *Nitrates, *Public health, *Water pollution effects, *Well water, Escherichia coli, Nitrites, Potable water, Water pollution sources.

Excessive amounts of nitrate in drinking water are assumed to increase the risk of infant well-water methemoglobinemia. Recent research suggests that methemoglobinemia is a very rare and disappearing disease in young bottlefed infants. Methemoglobinemia is multifactorial in origin, and although the relative importance of each causal factor has not been studied, it is associated with the use of water from private wells. The condition is linked with nitrate in water through clinical association. Since enteritis can also cause methemoglobinemia, the elimination of nitrate from drinking water cannot totally prevent outbreaks of methemoglobinemia. Effective prevention criteria should also stress water microbial purity. There is strong evidence that potable water with 50 mg NO3(-)/L is safe. Experience also indicates that potable water with up to 100 mg/NO3(-)/L is also safe. (See also W91-01211) (Author's abstract)

MICROPOLLUTANTS IN WATER USED FOR RENAL DIALYSIS: AN INTERNATIONAL PERSPECTIVE.
Imperial Coll. of Science and Technology, London (England). Public Health Engineering Lab.
S. Bragg, S. J. Sollars, and R. Perry.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 265-276, 1 fig, 10 tab, 41 ref.

Descriptors: *Aluminum, *Dialysis, *Disinfection, *Public health, *Renal dialysis, *Water pollution effects, *Water treatment, Bacteria, Calcium, Copper, Fluorides, Lead, Magnesium, Membrane processes, Nitrates, Organic compounds, Sulfates, Trace elements, Trace metals, Water pollution prevention, Zinc.

With the number of renal dialysis patients increasing in Europe and North America, the full importance of the quality of the water used for renal dialysis is being recognized. Aluminum intoxication in dialysis patients, first described in the early 1970's, highlighted the need for adequate treatment of water used to prepare dialysate. Other potential contaminants include calcium, magnesium, copper, lead, zinc, fluorides, sulfate, nitrate, chloramines, organic materials, and bacteria. Some of these, e.g. chloramines, may arise as a result of water treatment practice, while others, such as trace organic materials, are increasingly present in the environment and may not be completely removed at the water treatment stage. Use of aluminum sulfate as a coagulant in water treatment may be a source of high aluminum contents in dialysis water. Chloramines, chloroform, and other halogenated alkyls may be generated when chlorine is used for water disinfection. Bacterial growth may occur in water distribution systems, particularly if there are stagnant sections. Water softeners, sediment filters, carbon filters, reverse osmosis and deionizers are used in purifying dialysis water. Standards have been set by the European and American communities for the levels of trace compounds and elements permissible in dialysis water based on extensive research studies. Although monitoring trace impurities in dialysis water and the blood of dialysis patients may add up to 10% of the total cost of renal dialysis, such an investment might, in the long run, reduce overall costs of health care for dialysis patients. COMPLEXITY, ENTROPY AND ENVIRONMENTAL EFFECT.
Queen Mary Coll., London (England). School of Biological Sciences.
P. Johnston, and R. Stringer.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 283-291, 4 fig, 24 ref.

Descriptors: *Entropy, *Environmental effects, *Toxicity, *Toxicology, *Water pollution effects, Cleanup, Daphnia, England, Evaluation, Selenium.

The identification of an ecotoxicological problem usually occurs after the scope of the problem has become too wide to address in simple remedial terms. After a potential toxicological effect has been identified for a material then a wide evaluation generally follows. This causes a delay between the time a pollutant is identified and the time action is taken to eliminate it. The data generated to evaluate the toxic effects of inorganic selenium on Daphnia magna illustrates the time consuming process of a toxicological evaluation. Conceptual evaluations show that human use of energy will inevitably be associated with environmental degradation which can be regarded as an increase in entropy. Anthropogenically mobilized contaminants tend not to become evenly distributed throughout the environment as assumed by dischargers. Instead they selectively partition into environmental or biological compartments with which they have an affinity as a result of free energy considerations, or undergo entropy decreases as a result of biological energy input. Given the inability to predict the degree to which an ecosystem will be compromised by interaction with any given contaminant or to evaluate the degree of compromise once it has been established, dischargers of any materials to the wider environment should consider the precautionary principle axiomatic to the formulation of environmental legislation. TOXICITY OF WATER EXTRACTS OF HAZARDOUS WASTE.
Wyzsza Szkola Inzynierska, Zielona Gora (Poland).
E. S. Kempa, A. Jedrczak, M. Piontek, and A. Solski.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 297-305, 4 fig, 2 tab, 9 ref.

Descriptors: *Bioassay, *Bioindicators, *Hazardous wastes, *Industrial wastes, *Sludge, *Toxicity, *Water pollution effects, Aquatic plants, Cadmium, Chromium, Copper, Daphnia, Heavy metals, Metal-finishing wastes.

The toxicity of industrial wastes is measured by the content of noxious, chemically active substances and particularly by their solubility in water. The chemical composition of the water extracts does not fully reflect their noxious impact on the organisms living in the freshwater ecosystems. At improperly protected landfills, leachates often penetrate onto the aquifers causing pollution or even contamination of surface water and groundwater resources. Forty industrial solid wastes and sludges and their water extracts were analyzed for their toxicity to Lemna minor L., Daphnia magna Straus, and Dugesia tigrina Girard. A considerable differentiation in toxicity was observed. The most toxic turned out to be three electroplating sludges containing top limiting concentrations of heavy metals (cadmium, copper, and chromium). The animal organisms, especially Daphnia magna, were more sensitive to the water extracts of the tested wastes. The toxicity of sludges and wastes was expressed by the degree of water extracts: Group I, extremely toxic wastes (dilution < 1%), Group II, hazardous wastes (dilution from 1 to 10%), Group III, wastes of low toxicity (dilution from 10 to 100%), and Group IV, non-toxic wastes. COPPER TOXICITY TO PARATYA AUSTRALIENSIS: I. INFLUENCE OF NITRILOTRIACETIC ACID AND GLYCINE.
Chisholm Inst. of Tech., Melbourne (Australia). Center for Stream Ecology.
H. R. Daly, I. C. Campbell, and B. T. Hart.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 997-1006, August 1990. 5 tab, 2 fig, 40 ref.

Descriptors: *Amino acids, *Chemical speciation, *Copper, *Ion-selective electrodes, *Metal complexes, *Nitrilotriacetic acid, *Shrimp, *Toxicity, *Toxicology, *Water pollution effects, Bioassay, Heavy metals, Lethal limit, Mortality.

It is now widely accepted that the toxicity, bioavailability, and transport of heavy metals in aquat

systems are dependent upon the physicochemical forms, or speciation, of the particular metal. The relationship between copper speciation and acute toxicity to the Australian freshwater shrimp, Paratya australiensis was determined using a combination of copper ion selective electrode measurements, complexing resins and computer calculations to measure the speciation in test solutions. 48 hour LC50 values for P. australiensis exposed to copper in Melbourne tap water were 43 micrograms Cu/L (total copper) and 22 micrograms Cu/L (measured for Cu(++) ion). With a 1 micromolar concentration of NTA the 48 hour values were 109 and 25 micrograms Cu/L (calculated), respectively, and for 20 micromolar glycine solutions the values were 130 and 39 micrograms Cu/L (measured), respectively. A number of problems were encountered with the use of the copper ion selective electrode in waters containing added complexing agents. In solutions containing nitrilotriacetic acid or glycine, uncomplexed copper(II) ions were found to be the most acutely toxic form of copper to the shrimp. However, at least one other species, the singly charged complex (Cu-Glycine)(+), also appears to be mildly toxic. The results of this study demonstrate the importance of considering metal speciation when assessing the impact of heavy metals on aquatic organisms. COPPER TOXICITY TO PARATYA AUSTRALIENSIS: II. INFLUENCE OF BICARBONATE AND IONIC STRENGTH.
Chisholm Inst. of Tech., Melbourne (Australia). Center for Stream Ecology.
M. R. Day, I. C. Campbell, and B. T. Hart.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 1007-1011, August 1990. 1 fig, 3 tab, 22 ref.

Descriptors: *Bicarbonates, *Chemical speciation, Copper, *Ionic interference, *Metal complexes, Shrimp, *Sodium chloride, *Toxicity, *Toxicology, *Water pollution effects, Alkaline water, Bioassay, Cations, Heavy metals, Ion-selective electrodes, Lethal limit, Mortality.

Experiments were conducted as part of a study on the relationship between the physicochemical forms of copper and its toxicity to the Australian freshwater shrimp, Paratya australiensis. The acute toxicity of copper to P. australiensis was shown to decrease in solutions of increasing alkalinity brought about by the addition of sodium bicarbonate, NaHCO3. This effect could not be explained entirely in terms of changes in copper speciation in the solutions. Estimates of the free copper(II) ion concentration of the LC50 values were made using both copper ion selective electrode measurements and chemical equilibrium computer calculations. Whereas there were discrepancies between the estimates obtained using these methods, both indicated an apparent increase in tolerance of P. australiensis to the free copper (II) ion in more alkaline waters. An additional set of experiments, in which sodium chloride was added to test waters in place of sodium bicarbonate, demonstrated that the increased tolerance of P. australiensis to copper in higher alkalinity waters was caused by a combination of physiological effects associated with increased ionic strength of the test waters and, to a lesser extent, changes in metal speciation in test waters. COPPER TOXICITY TO PARATYA AUSTRALIENSIS: III. INFLUENCE OF DISSOLVED ORGANIC MATTER.
Chisholm Inst. of Tech., Melbourne (Australia). Center for Stream Ecology.
M. R. Daly, M. J. Jones, B. T. Hart, and I. C. Campbell.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 1013-1018, August 1990. 1 fig, 3 tab, 22 ref.

Descriptors: *Chemical speciation, *Copper, *Dissolved solids, *Metal complexes, *Shrimp, *Toxicity, *Toxicology, Bioassay, Heavy metals, Ion-selective electrodes, Lethal limit, Mortality, Natural waters.

Experiments were conducted as part of a study on the relationship between the physicochemical forms of copper and its toxicity to the Australian freshwater shrimp, Paratya australiensis. The influence of dissolved organic matter on the toxicity of copper to P. australiensis was measured using water collected from three sites in Victoria, Australia. A two-ligand model was used to describe copper complexation in these test waters. The binding characteristics of the ligands (i.e., total ligand concentrations and conditional stability constants) were determined using a method combining ion selective electrode and anodic stripping voltammetry. Ion selective measurements and the two-ligand model were each used to estimate the concentration of copper(II) (the major toxic species) at the LC50 values. Both methods overestimated by a factor of approximately 1.5 to 3 the expected copper(II) concentration at the LC50 values, based on earlier experiments in Melbourne tap water. The agreement seems remarkably good given the many assumptions used in making the comparison and the difficulties encountered with the use of ion selective electrodes in natural waters. Regulation of surface water discharge of toxic substances through the use of whole effluent toxicity testing is being used with increasing frequency for state and federal programs. In this study, instream toxicity was predicted with whole effluent toxicity tests. These results were then compared to the observed instream response of the aquatic community. Forty-three comparisons were conducted in freshwater flowing systems using Ceriodaphnia dubia chronic toxicity test procedures and standardized qualitative sampling of benthic macroinvertebrates. In 88% of the comparisons there was agreement between both measures. These data suggest that the use of effluent toxicity testing results as a regulatory tool is effective and appropriate. Comparisons used whole effluent toxicity limitations similar to those being written in North Carolina's NPDES permits for discharge to surface waters. (Author's abstract)

ACUTE TOXICITIES OF FIVE SYNTHETIC PYRETHROID INSECTICIDES TO DAPHNIA MAGNA AND CERIODAPHNIA DUBIA.
Texas Christian Univ., Fort Worth. Dept. of Biology.
L. E. Mokry, and K. D. Hoagland.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 1045-1051, August 1990. 4 tab, 25 ref.

Descriptors: *Daphnia, *Insecticides, *Permethrins, *Pesticide toxicity, *Pyrethrins, *Toxicity, *Toxicology, *Water pollution effects, Bioassay, Median tolerance limit, Mortality.

The acute toxicities of four recently developed pyrethroid insecticides (bifenthrin, cyfluthrin, lambda cyhalothrin and tralomethrin) were experimentally compared to the acute toxicity of a first generation pyrethroid (permethrin), in static-flow, 48-hour bioassays with Daphnia magna and Ceriodaphnia dubia. The four new generation pyrethroids exhibited greater toxicity in comparison to permethrin, which had 48 hour LC50s of 1.25 micrograms/L for D. magna and 0.55 micrograms/L for C. dubia. LC50s for D. magna and C. dubia were 0.32 and 0.07 for bifenthrin, 0.17 and 0.14 for cyfluthrin, 1.04 and 0.30 for lambda cyhalothrin, and 0.15 and 0.26 micrograms/L for tralomethrin, respectively. Tralomethrin and cyfluthrin were most toxic to D. magna, and C. dubia was equally or more sensitive the D. magna to all of the insecticides. This indicates higher biological activity of the newer pyrethroids than permethrin to nontarget organisms. (VerNooy-PTT)

YOLK RETINOIDS (VITAMIN A) IN EGGS OF THE HERRING GULL AND CORRELATIONS WITH POLYCHLORINATED DIBENZO-P-DIOXINS AND DIBENZOFURANS.
Ottawa Univ. (Ontario). Dept. of Biology.
P. A. Spear, D. H. Bourbonnais, R. J. Norstrom, and T. W. Moon.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 1053-1061, August 1990. 3 fig, 3 tab, 36 ref.

Descriptors: *Bioindicators, *Birds, *Dioxins, *Eggs, *Gulls, *Polychlorinated biphenyls, *Polycyclic aromatic hydrocarbons, *Teratogenic effects, *Toxicology, *Vitamins, *Water pollution effects, Correlation analysis, Great Lakes, High performance liquid chromatography, Monitoring.

Little is known of the combined effects associated with chronic, low-level exposure of wildlife to the polyhalogenated dibenzo-p-dioxins (PCDDs for chlorinated compounds), dibenzofurans (PCDFs), certain biphenyls and other related compounds. To examine possible effects upon egg yolk retinoids, herring gull (Larus argentatus) eggs were collected at early (i.e., days 2-12) and late (i.e., approximately day 20) phases of incubation. Analysis of egg yolks by reversed-phase high-performance liquid chromatography revealed compounds that comigrated with all-trans-retinyl palmitate standards. The retinol concentration and the molar ratio of retinol to retinyl palmitate changed significantly between the early and late phases of incubation. Within the 2 to 12 day period of incubation, however, retinoid values were constant. Gull eggs were collected from two breeding colonies on the Great Lakes in 1986 and from five colonies in 1987. In 2 to 12 day eggs, retinol and retinyl palmitate concentrations were significantly different between gull colonies. The molar ratio of retinol to retinyl palmitate was significantly different between colonies and correlated with several indices of polychlorinated dibenzo-p-dioxin and dibenzofuran concentrations quantified in gull eggs from these collection sites. Significant correlations existed between the molar ratio of retinoids and 2,3,7,8-tetrachloro-dibenzodioxin (TCDD), toxic equivalents of PCDDs and PCDFs and the sum of PCDD and PCDF concentrations. These results, and data from a previous study of vitamin A stores support the hypothesis that chlorinated dioxins and possibly other contaminants are affecting the vitamin A status of wild birds. Changes in yolk retinoids may prove to be an early indicator of such effects as embryo mortality and teratogenesis of the type currently observed in Great Lakes birds. (Author's abstract)

TOXICITY OF FLUORANTHENE IN SEDIMENT TO MARINE AMPHIPODS: A TEST OF

LIBRARY U. OF I. URBANA-CHAMPAIGN

THE EQUILIBRIUM PARTITIONING APPROACH TO SEDIMENT QUALITY CRITERIA.

Environmental Research Lab.-Narragansett, Newport, OR. Mark O. Hatfield Marine Science Center.
R. C. Swartz, D. W. Schults, T. H. Dewitt, G. R. Ditsworth, and J. O. Lamberson.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 1071-1080, August 1990. 5 fig, 4 tab, 33 ref. EPA Agreement CX812-792-01-0.

Descriptors: *Amphipods, *Bioassay, *Fluoranthene, *Marine pollution, *Polycyclic aromatic hydrocarbons, *Sediment contamination, *Toxicity, *Toxicology, *Water pollution effects, Environmental quality, Equilibrium, Interstitial water, Model studies, Mortality, Path of pollutants, Population exposure.

The toxicity to the marine benthic amphipods, Rhepoxynius abronius and Corophium spinicorne, of fluoranthene in sediment was determined in relation to the equilibrium partitioning (EP) approach to the development of sediment quality criteria. Toxicity tests were conducted with well-sorted fine sands at three levels of organic carbon (OC), 0.18, 0.31, and 0.48%. Measured interstitial water concentrations of fluoranthene less than 50 microg/L were highly correlated with predictions based on the EP model. LC50s based on total fluoranthene concentrations increased significantly with increasing sediment OC. LC50s based on fluoranthene concentration in interstitial water were not significantly different between 0.18 and 0.48% OC or between 0.31 and 0.48%, but the LC50 at 0.31 was significantly higher than that at 0.18% OC. The regression of sediment OC on bulk fluoranthene LC50 was linear, indicating that the concentration of fluoranthene in interstitial water was constant at equitoxic conditions, as predicted by the EP model. The 10-day LC50 of fluoranthene in interstitial water (23.8 microg/L) was intermediate between the acute (40 microg/L) and chronic (16 microg/L) EPA water quality standards for fluoranthene. The epibenthic, tube-dwelling Corophium was less sensitive to test sediments than the infaunal, free-borrowing Rhepoxynius, possibly because of different routes of exposure to fluoranthene. There was a close correspondence between estimates of sediment quality for fluoranthene based on distinctly different methodologies including EP, apparent effects threshold, toxicity tests applied to experimentally spiked sediment and toxicity tests applied to field-collected sediment. (Author's abstract)

ASSESSMENT OF THE ONTARIO MINISTRY OF THE ENVIRONMENT PROTOCOLS FOR CONDUCTING DAPHNIA MAGNA ACUTE LETHAL TOXICITY TESTS WITH PULP AND PAPER MILL EFFLUENTS.

Pulp and Paper Research Inst. of Canada, Pointe Claire (Quebec).
T. G. Kovacs, and S. M. Ferguson.
Environmental Toxicology and Chemistry ETOCDK, Vol. 9, No. 8, p 1081-1093, August 1990. 3 fig, 9 tab, 36 ref.

Descriptors: *Bioassay, *Daphnia, *Laboratory methods, *Pulp and paper industry, *Quality control, *Toxicity, *Toxicology, *Water pollution effects, Canada, Effluents, Mortality, Performance evaluation, Testing procedures, Variation coefficient, Water quality standards.

The Ontario Ministry of the Environment protocols for conducting Daphnia magna acute lethal toxicity tests were evaluated for pulp and paper mill effluents. The evaluation included an interlaboratory study and an intralaboratory assessment using different dilution waters, test containers and pH adjustment. When the tests were conducted under similar conditions, the results (i.e, 48-hour LC50s) from four participating laboratories were similar. With one exception, the coefficients of variation for interlaboratory testing ranged from 3.0 to 17%. However, within a laboratory, the ratio of the highest to lowest LC50 values for a particular effluent ranged from 1.9 to 3.8 when using different dilution waters and ranged from 1.3 to 1.9 when the test solution pH was adjusted to the same level as the dilution water pH. The D. magna were found to be 1.5 to 4.0 times less sensitive than rainbow trout and 1.6 to 3.0 times less sensitive than Ceriodaphnia affinis to pulp and paper mill effluents, and dehydroabietic acid. (Author's abstract)

EUTROPHICATION: ASSESSMENT, RESEARCH AND MANAGEMENT WITH SPECIAL REFERENCE TO SCOTLAND'S FRESHWATERS.

Institute of Terrestrial Ecology, Edinburgh (Scotland).
A. E. Bailey-Watts.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 285-294, June 1990. 6 fig, 86 ref.

Descriptors: *Algal growth, *Eutrophication, *Limnology, *Literature review, *Nutrient concentrations, *Scotland, *Water quality management, Algal blooms, Freshwater, Nitrogen, Phosphorus, Pollution load, Research, Water quality control.

In response to the extraordinarily high profile currently maintained by algae, aspects of pure and applied research on eutrophication were investigated. In addition to restating a number of issues which were raised decades ago when the importance of this environmental problem was first recognized, the following aspects are explored using data collected mainly over the last 20 years and referring primarily to Scottish studies: (i) algal-nutrient relations and the contrasting manner in which nitrogen and phosphorus enter freshwaters and are sequestered by planktonic organisms; (ii) estimates of the loadings of phosphorus to freshwaters from various sources; (iii) the effects on the perception of algal problems and the use to which the waters are intended; (iv) the extent and limitations of existing scientific knowledge about eutrophication, and its application to the formulation and execution of eutrophication control strategies; and (v) the arguments for maintaining in-depth limnological surveillance programs. (Author's abstract)

INTERACTION OF CARBON TETRACHLORIDE WITH BETA-NAPHTHOFLAVONE-MEDIATED CYTOCHROME P450 INDUCTION IN WINTER FLOUNDER (PSEUDOPLEURONECTES AMERICANUS).

Louisiana State Univ., Baton Rouge. School of Veterinary Medicine.
K. M. Kleinow, B. F. Droy, D. R. Buhler, and D. E. Williams.
Toxicology and Applied Pharmacology TXAPA9, Vol. 104, No. 2, p 365-374, June 15, 1990. 3 fig, 1 tab, 25 ref. Mount Desert Island Biological Laboratory--Marine and Freshwater Biomedical Sciences Specialized Research Center Grant EHA 1 P30 ES03828-02.

Descriptors: *Bioassay, *Chlorinated hydrocarbons, *Cytochromes, *Fish physiology, *Flounders, *Naphthoflavone, *Toxicity, Animal tissues, Biochemical tests, Histology, Immunology, Liver, Sublethal effects, Tissue analysis.

Cytochrome P450-dependent activity in fish has been shown to be induced by exposure to low levels of environmental pollutants. This response to environmental xenobiotics has focused attention upon P450 induction as a possible biological monitoring tool. In this study, the interaction between beta-naphthoflavone induction (BNF; 100 mg/kg) and carbon tetrachloride (CCl4; 1 mL/kg) hepatotoxicity was examined in the flounder. Treatment groups composed of control, BNF, CCl4, and BNF/CCl4 were compared in terms of cytochrome P450 isozyme content (LM sub 4b; LM sub 2), catalytic activity, isozyme distributions, SGOT-STPT levels and pathology. CCl4 administration resulted in significant reductions in both the constitutive P450 (LM sub 2) and the BNF-inducible isozyme (LM sub 4b) as well as elevations in SGPT and SGOT levels. The decline in LM sub 4b isozyme content was reflected by stoichiometric decreases in ethoxyresorufin-O-deethylase activities. BNF/CCl4 coadministration was protective in part against CCl4 hepatotoxicity. Immunohistochemistry indicated that LM sub 4b was diffusely distributed throughout the liver. These interactions have demonstrated a multiple P450 isozyme involvement, the protective nature of BNF against CCl4 hepatotoxicity in the flounder, the ability to maintain an inductive response in face of CCl4 coadministration, and the diffuse distributional pattern of LM sub 4b in the flounder liver. INDUCTION OF PEROXISOME PROLIFERATION IN RAINBOW TROUT EXPOSED TO CIPROFIBRATE.

Massachusetts Univ., Amherst. School of Public Health.
J. H. Yang, P. T. Kostecki, E. J. Calabrese, and L. A. Baldwin.
Toxicology and Applied Pharmacology TXAPA9, Vol. 104, No. 3, p 476-482, July 1990. 2 fig, 2 tab, 27 ref. US Army Medical Research and Development Command Contract DAMD17-88-C-8051.

Descriptors: *Biochemical tests, *Ciprofibrate, *Fish physiology, *Path of pollutants, *Peroxisomes, *Toxicity, *Trout, *Water pollution effects, Bioassay, Enzymes, Immunoassay, Liver, Sublethal effects, Tissue analysis.

A number of chemicals, especially those used as hypolipidemic drugs and phthalate ester plasticizers, have been identified as peroxisome proliferators. While considerable information on interspecies comparison is available in mammalian models, there is a general lack of information on responses of fish species to peroxisome proliferators. Rainbow trout (Salmo gairdneri), average body weight of 450 grams, were treated with 15, 25, or 35 mg/kg of ciprofibrate via intraperitoneal injection every other day for 2 to 3 weeks. The effects on hepatic peroxisomal acyl-CoA oxidase, polypeptide PPA-80, catalase, and liver weight were measured. The treatment of trout with ciprofibrate showed significant dose-related increases in peroxisomal acyl-CoA activity, polypeptide PPA-80 and catalase after 3 weeks of exposure. Peroxisomal oxidase activity showed a significant ($p = 0.008$) increase (78%) at 35 mg/kg and a marginal ($p = 0.1$) increase (27%) at 25 mg/kg after 3 weeks of exposure. Densitometric analysis of polypeptide PPA-80 and catalase showed increases up to 48 and 236% at 35 mg/kg, respectively. Morphometric analysis on livers of trout administered 35 mg/kg for 3 weeks showed a 2.3-fold increase of peroxisomal volume density, as compared to control. This study demonstrates the induction of peroxisome proliferation in rainbow trout administered ciprofibrate, a known peroxisome proliferator in rodents. (Author's abstract)

Epidemiology, Public health, Regression analysis, Statistical studies.

A significant dose-response relation between ingested arsenic and several cancers has recently been reported in four townships of the endemic area of blackfoot disease, a unique peripheral artery disease related to the chronic arsenic exposure in southwestern Taiwan. This study was carried out to examine ecological correlations between arsenic levels of well water and mortality from various malignant neoplasms in 314 precincts and townships of Taiwan. The arsenic content of water in 83,656 wells was determined by a standard mercuric bromide stain method from 1974-1976, while mortality rates of 21 malignant neoplasms among residents in study precincts and townships from 1972-1983 were standardized to the world population in 1976. A significant association with the arsenic level in well water was observed for cancers of the liver, nasal cavity, lung, skin, bladder and kidney in both males and female as well as for prostate cancer in males. These associations remain significant after adjusting for indices of urbanization and industrialization through multiple regression analyses. The multivariate-adjusted regression coefficient indicating an increase in age adjusted mortality per 100,000 person-years for every 0.1 ppm increase in arsenic level of well water was 6.8 and 2.0, 0.7 and 0.4, 5.3 and 5.3, 0.9 and 1.0, 3.9 and 4.2, as well as 1.1 and 1.7 respectively, in males and females for cancers of the liver, nasal cavity, lung, skin, bladder and kidney. The multivariate-adjusted regression coefficient for the prostate cancer was 0.5. These weighted regression coefficients were found to increase or remain unchanged in further analyses in which only 170 southwestern townships were included. (Author's abstract)

rine organisms that occur in coastal and estuae habitats may be exposed to toxic concentrans of trace metals. When acute toxicity (meas-d on the basis of LC50) is used as a measure of tive sensitivity, it has generally been found that al stages of fish and invertebrates are killed at er concentrations of metals than adults. Emos, four different ages of larvae, juveniles and lts of a Hawaiian bivalve, Isognomon californi, were exposed to a range of cadmium concenions at two salinities to determine 48-hour 50 and to compare the relative sensitivities of various life stages. The Cd 48-hour LC50 of ryos, 3-day and 10-day old larvae were similar, bout 0.5 mg/L. Older larvae, 24 and 36-day, showed a similar sensitivity to each other but r LC50s (4.0 mg/L) were approximately one er of magnitude higher than those of the nger stages. Newly settled juveniles were less itive than embryonic or larval stages and ts were the least sensitive. There was a general d to increased toxicity with decreased salinity, salinity effects were not significant with late ae, juveniles, or adults. (Mertz-PTT)

LUENCE OF CADMIUM AND ZINC ON MIUM TURNOVER IN THE ZEBRAFISH, CHYDANIO RERIO.
ala Univ. (Sweden). Dept. of Zoology.
icklund, L. Norrgren, and P. Runn.
ives of Environmental Contamination and cology AECTCV, Vol. 19, No. 3, p 348-353, June 1990. 2 fig, 2 tab, 16 ref.

Descriptors: *Bioaccumulation, *Bioassay, *Cadmium, *Fish physiology, *Heavy metals, *Path of pollutants, *Toxicology, *Water pollution effects, *Zinc, Chronic toxicity, Radioactive tracers, Synergistic effects, Toxicity, Water pollution, Zebra fish.

A study was made of the dynamics of non-dietary cadmium in fish exposed to different concentrations of cadmium and zinc in water. Zebrafish, Brachydanio rerio, were exposed to Cd and Zn for various periods. The fate of a short pulse of the radioactive tracer 109Cd (3 or 9 days) was studied during a post-pulse period of 53 or 83 days. The majority of the 109 Cd taken up in the gills during the pulse period was retained in the gill tissue and slowly transferred to the internal organs or lost to the water during the post-pulse period. The retention of tracer in the gills after a 3-day 109Cd pulse was increased by Zn but not by Cd. Continuous exposure to stable Cd increased the rate of turnover of the retained 109Cd. Both Cd and Zn increased the tracer accumulation in the liver and kidney. The results also indicated that the effect of Zn on the Cd turnover might be lost if the environmental Zn is withdrawn before the start of the 109 Cd pulse. A tendency for increased mortality in the fish exposed to 1 microgram Cd/L for 2-3 months suggested that low concentrations of Cd is toxic to the fish during chronic exposure. The increased Cd uptake and transfer in the gills, caused by Zn, could have deleterious effects on the fish. It might also reflect a change in the form of transport and in the intracellular handling of the metal, which protects the fish from Cd toxicity. However, a Zn pre-exposure did not decrease the mortality, which suggests that Zn did not protect the fish from Cd toxicity. (Mertz-PTT)

EFFECTS OF TRIBUTYLTIN ON DEFENSE-RELATED ACTIVITIES OF OYSTER HEMOCYTES.
Maryland Univ., Cambridge. Horn Point Environmental Labs.
W. S. Fisher, A. Wishkovsky, and F.-L. E. Chu.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 354-360, May/June 1990. 5 fig, 1 tab, 36 ref. University of Maryland Sea Grant College NA86-AA-D-FG-006.

Descriptors: *Antifoulants, *Biocides, *Oysters, *Toxicity, *Toxicology, *Tributyltin, *Water pollution effects, Bioassay, Chemiluminescence, Crassostrea, Mollusks, Paints, Salinity, Water pollution.

Tributyltin compounds are used in marine antifouling paints as a biocide. Initial reports on the effects of tributyltin on economically important oysters, Crassostrea gigas, demonstrated shell abnormalities. Subsequent research on bivalve molluscs has found tributyltin to affect chromosomes, sex ratio and gamete production, and embryo and larval survival. Several defense-related activities of hemocytes from oysters (Crassostrea virginica and C. gigas) were assayed in vitro with different levels of tributyltin (0.4-4000 parts per billion) to determine whether defense-related cell mechanisms were affected. Chemiluminescence, a presumptive indicator of phagocytic activity, was reduced with increasing concentrations of tributyltin and preincubation with tributyltin appeared to eliminate chemiluminescence. Locomotion of hemocytes was also retarded by tributyltin, but the ability of the hemocytes to spread to an ameboid shape was not affected. In vitro salinity regulation of oceanic oyster hemocytes to lower salinities was not affected by tributyltin exposure and salinity regulation of estuarine oyster hemocytes to higher salinities was retarded only after a salinity change from 12 parts per trillion to 36 parts per trillion. (Mertz-PTT)

MACROINVERTEBRATE COMMUNITY RESPONSES TO COPPER IN LABORATORY AND FIELD EXPERIMENTAL STREAMS.
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental and Hazardous Material Studies.
W. H. Clements, D. S. Cherry, and J. Cairns.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 361-365, May/June 1990. 3 fig, 2 tab, 22 ref.

Descriptors: *Copper, *Heavy metals, *Macroinvertebrates, *Streams, *Toxicity, *Toxicology, *Water pollution effects, Caddisflies, Dechlorinated water, Laboratory methods, Mayflies, Water pollution.

Macroinvertebrate community responses to copper in laboratory streams receiving dechlorinated tap water and field streams receiving natural river water were compared. Since both tap water and natural river water were taken from the same source in these experiments, several of the important water quality parameters known to influence heavy metal toxicity were similar. Despite the fact that field streams were initially dominated by metal-sensitive Ephemeroptera, effects of Cu were greater in the laboratory. After 10 days of exposure to Cu (11.3 microgram/L), macroinvertebrate abundance was reduced by 75% in laboratory streams compared to 44% in field streams. In the field, the number of taxa was reduced by 10% in treated streams compared to 56% in the laboratory. The response of dominant taxa to Cu exposure was also greater in the laboratory. In the field, abundance of metal-tolerant caddisflies (Hydropsychidae:Trichoptera) was similar in control and treated streams (11.3 microgram/L). These organisms were reduced by 71% in laboratory streams at similar Cu levels. The greater impact of Cu observed in laboratory streams may have resulted from the inability of certain taxa to acclimate to laboratory conditions. The usefulness of community-level toxicity tests in the laboratory may be limited due to the overestimation of metal toxicity. Further research should be conducted in field mesocosms receiving water directly from the system under investigation. (Author's abstract)

ACUTE TOXICITY OF BORON, MOLYBDENUM, AND SELENIUM TO FRY OF CHINOOK SALMON AND COHO SALMON.
National Fisheries Contaminant Research Center, Yankton, SD. Field Research Station.
S. J. Hamilton, and K. J. Buhl.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 366-373, May/June 1990. 7 tab, 39 ref.

Descriptors: *Acute toxicity, *Boron, *Fish physiology, *Molybdenum, *Salmon, *Selenium, *Toxicology, *Water pollution effects, Brackish water, Freshwater, Growth stages, Oncorhynchus, Selenates, Selenites, Toxicity, Water pollution.

The acute toxicities of boron, molybdenum, and various forms of selenium, individually and in environmentally relevant mixtures, to swim-up and advanced fry of chinook salmon (Oncorhynchus tshawytscha) and coho salmon (O. kisutch) were determined in site-specific fresh and brackish waters. Boron and molybdenum were relatively nontoxic (96-hour LC50 > 100 mg/L) to both life stages of both species. Selenite was significantly more toxic than selenate to both species. Swim-up fry tested in fresh water were significantly more sensitive than advanced fry in brackish water to selenate and selenite. No mortalities occurred in any concentrations tested of seleno-DL-methionine; however, in the highest concentration (21.6 mg Se/L), at least 50% of the fish showed pronounced surfacing behavior. Coho salmon were more sensitive than chinook salmon to both selenate and selenite at either life stage; only the swim-up fry of coho salmon were more sensitive than chinook salmon to boron. In additional tests with swim-up chinook salmon, differences in the characteristics of the dilution water did not significantly modify the relative toxicities of boron, selenate, and selenite. In binary mixture studies, the joint acute toxic action of selenate and selenite, combined in various ratios, was additive to both species. Based on a comparison of the individual acute values for chinook salmon to the expected environmental concentrations, the margin of safety for boron was only 56 in fresh and 46 in brackish water. The margins of safety for selenate and sele-

LIBRARY U. OF I. URBANA-CHAMPAIGN

nite exceeded 275 in both fresh and brackish waters. However, the margin of safety for both selenate and selenite in the mixture test was 145 in fresh water and 220 in brackish water. (Author's abstract)

BEHAVIORAL INDICATORS OF SUBLETHAL TOXICITY IN RAINBOW TROUT.
National Fisheries Contaminant Research Center, Columbia, MO.
E. E. Little, R. D. Archeski, B. A. Flerov, and V. I. Kozlovskaya.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 380-385, May/June 1990. 2 tab, 29 ref.

Descriptors: *Agricultural chemicals, *Chronic toxicity, *Fish behavior, *Toxicity, *Toxicology, *Trout, *Water pollution effects, Carbaryl, Chlordane, Dimethylamine salts, Methyl parathion, Oncorhynchus, Pentachlorophenol, Sublethal effects, Tributyl phosphorotrithioate, Water pollution.

Four measures of behavior--spontaneous swimming activity, swimming capacity, feeding behavior, and vulnerability to predation--were assessed as indicators of sublethal toxicity in rainbow trout (Oncorhynchus mykiss) in 96-hour exposures to sublethal concentrations of six agricultural chemicals: carbaryl, chlordane, dimethylamine salt of 2,4-dichlorophenoxyacetic acid, tributyl phosphorotrithioate, methyl parathion, and pentachlorophenol. After exposures, behavioral changes consistently demonstrated sublethal toxicity, but effects on specific behaviors varied with contaminants and the concentrations were altered by the water quality criterion concentration for chlordane (2 microgram/L), and at a concentration of tributyl phosphorotrithioate (5 microgram/L) that had previously been shown to inhibit growth and survival after a 90-day exposure. Feeding behavior was inhibited most by exposure to tributyl phosphorotrithioate, 2,4-dichlorophenoxyacetic, and methyl parathion. Vulnerability to predation was heightened most by exposure to carbaryl and pentachlorophenol. Although all chemicals inhibited spontaneous swimming activity, only carbaryl, tributyl phosphorotrithioate, and 2,4-dichlorophenoxyacetic influenced swimming capacity. (Author's abstract)

SPECIES-SPECIFIC REACTION OF LIVER ULTRASTRUCTURE IN ZEBRAFISH (BRACHYDANIO RERIO) AND TROUT (SALMO GAIRDNERI) AFTER PROLONGED EXPOSURE TO 4-CHLOROANILINE.
Heidelberg Univ. (Germany, F.R.). Dept. of Zoology 1.
T. Braunbeck, B. Storch, and H. Bresch.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 405-418, May/June 1990. 32 fig, 68 ref. Federal Republic of Germany UFOPLAN (environmental research program) FE-Nr. 10603046 and German Research Foundation DFG Sto 75/9.

Descriptors: *Chloroaniline, *Fish, *Fish physiology, *Pesticide toxicity, *Pesticides, *Toxicity, *Toxicology, *Trout, *Water pollution effects, *Zebra fish, Chronic toxicity, Tissues, Water pollution.

The morphological alterations of hepatocytes of female zebrafish, Brachydanio rerio, and fingerling rainbow trout, Salmo gairdneri, following prolonged exposure to 0.04, 0.2, and 1 mg/L of 4-chloroaniline were investigated by means of light and electron microscopy. Changes in peroxisomes were visualized by cytochemical demonstration of catalase activity after incubation in the alkaline diaminobenzidine medium. The amount of storage products was illustrated by the silver impregnation technique. In a dose-dependent manner, the reaction of female zebrafish liver is characterized by a disturbance of hepatocytic compartmentation, progressive fenestration and fractionation of the rough endoplasmic reticulum, a decrease in the number of peroxisomes and catalase activity, stratified inclusions in mitochondria, and an augmentation of lysosomes and myelinated bodies. Trout hepatocytes display nuclear inclusions, fractionation and vesiculation of the endoplasmic reticulum, and an increase in mitochondria, but a decrease of peroxisomes and catalase activity. Whereas glycogen stores are exhausted at 1 mg/L 4-chloroaniline, lipid deposits are amplified. An elevated rate of hepatocytic mitosis as well as the occurrence of glycogen-condensing cells probably derived from hepatocytes indicate the induction of proliferative processes in trout liver. Evaluation and comparison of results with earlier reports suggest that despite the unspecificity of some alterations, the combination of pathological symptoms yields a syndrome specific for the species and the substance studied. As a consequence, histological and cytological investigations are recommended as a routine supplement in an integrated test schedule for the assessment of sublethal effects of pollutants in the aquatic environment. LONG-TERM TOXICITY TEST COMPRISING REPRODUCTION AND GROWTH OF ZEBRAFISH WITH 4-CHLOROANILINE.
Bundesforschungsanstalt fuer Ernaehrung, Karlsruhe (Germany, F.R.).
H. Brsch, H. Beck, D. Ehlermann, H. Schlaszus, and M. Urbanek.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 419-427, May/June 1990. 4 fig, 1 tab, 28 ref. Federal Environmental Agency (FRG) UFOPLAN (environmental research program) FE-Nr. 10603046.

Descriptors: *Bioassay, *Bioindicators, *Fish physiology, *Pesticide toxicity, *Testing procedures, *Toxicity, *Toxicology, *Water pollution effects, Chronic toxicity, Fish eggs, Long-term test, Reproduction, Zebra fish.

A long-term test over three generations was conducted, using zebrafish (Brachydanio rerio) as the test species and concentrations of 1, 0.2, and 0.04 mg/L 4-chloroaniline as a model substance. The effect of the compound on the ecologically important parameters of reproduction and growth was studied. Reduction in egg release by fish raised under 4-chloroaniline was the most sensitive parameter in the test. Compared to the toxic threshold concentration for growth (0.4 mg/L), egg release was affected by a ten-fold lower concentration (0.04 mg/L). Results show that long-term study is the most appropriate method to assess the chronic toxicity of a substance on fish. Long-term tests start with eggs from unexposed parents and continue into a second generation, because sexual maturity of fish from the first generation will not show disturbances in growth or reproduction caused by abnormal development of gonads. To reveal such effects the test should either begin with adult fish exposed to the test substance and continue through the growth of at least one generation, or a test should be started with eggs from unexposed parents and then should be conducted until sexual maturity of the second generation. ACID PRECIPITATION AND FOOD QUALITY: INHIBITION OF GROWTH AND SURVIVAL IN BLACK DUCKS AND MALLARDS BY DIETARY ALUMINUM, CALCIUM, AND PHOSPHORUS.
Patuxent Wildlife Research Center, Laurel, MD.
D. W. Sparling.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 457-463, May/June 1990. 5 fig, 4 tab, 27 ref.

Descriptors: *Acid rain effects, *Aluminum, *Calcium, *Ducks, *Phosphorus, *Water pollution effects, *Waterfowl, Black ducks, Diets, Growth, Mallards, Mortality.

In areas impacted by acid precipitation, water chemistry of acidic ponds and streams often changes, resulting in increased mobilization of aluminum and decreased concentration of calcium carbonate. Aluminum binds with phosphorus and inhibits its uptake by organisms. Thus, invertebrate food organisms used by waterfowl may have inadequate Ca and P or elevated Al for normal growth and development. Acid rain and its effects may be one of the factors negatively impacting American black ducks (Anas rubripes) in eastern North America. One-day old mallards (A. platyrhynchos) and black ducks were placed on one of three Ca:P regimens: low:low, normal:normal, and low:high with each regimen divided further into three or four Al levels for 10 weeks. 45% of the black ducks died on nine different diets whereas only 28% of the mallards died on three different diets. Mortality was significantly related to diet in both species. Growth rates for body weight, culmens, wings, and tarsi of both species on control diet exceeded those on many treatment diets but the differences were less apparent for mallards than for black ducks. Differences among treatments were due to both Ca:P and Al levels. Over a period of two to three weeks, high Al diets coupled with low Ca and P were most toxic to ducklings. Al was toxic even when Ca and P levels approximated generally accepted dietary levels. Elevated levels of P may reduce mortality of birds on high Al compared with those on diets with low Ca and P, but comparable Al levels. (Mertz-PTT)

METABOLIC EFFECTS OF KRAFT MILL EFFLUENTS ON THE EEL ANGUILLA ANGUILLA L.
Aveiro Univ. (Portugal). Dept. of Biology.
M. A. Santon, F. Pires, and A. Hall.
Ecotoxicology and Environmental Safety EESADV, Vol. 20, No. 1, p 10-19, August 1990. 10 fig, 4 tab, 21 ref. Protugese INIC Contract 85 CNA/6.

Descriptors: *Eel, *Fish physiology, *Kraft mill wastes, *Pulp and paper industry, *Pulp wastes, *Water pollution effects, Anguilla, Portugal, Tissues, Wastewater, Water pollution.

In Portugal, large quantities of Kraft pulp mill wastes are discharged into estuarine and free waters and young fish and their prey may be affected by prolonged exposure to dilute concentrations of kraft and pulp mill effluents. Yellow eels (Anguilla anguilla L.) with an average weight of 60 g were caught in June/July at the Aveiro Lagoon on the Portugese West Coast, transported to the Department of Biology, Aveiro University and kept in aerated aquaria for 1 week before the experiment started. The eels were then exposed for 1 and 3 weeks to 75 and 50% of the kraft pulp mill effluent. The eels exposed to the kraft pulp mill effluent developed an increase in red blood cell number per cubic millimeter and several biochemical changes, such as an increase in plasma lactate and sodium and a decrease in plasma pyruvate and potassium. Histological examination of the experimental eels exposed to the 50% kraft pulp mill effluent revealed deep alteration of the tissue structure, such as disruption of the skin and edematous hypertrophy of covering epithelial cells in secondary gill lamellae. The kidney had damage of the renal tubules. The liver developed necrosis supported by a significant decrease in glutamic oxaloacetic transaminase and glutamic pyravic transaminase activity. The spleen had an increase in blood content as well as in pigment centers. Previous results indicated that kraft pulp mill effluent causes tissue damage and consequent metabolic changes in the eel Anguilla anguilla L. (Mertz-PTT)

Ecotoxicology and Environmental Safety EESADV, Vol. 20, No. 1, p 20-29, August 1990. 5 tab, 30 ref.

Descriptors: *Bioassay, *Chromium, *Crabs, *Crustaceans, *Toxicity, *Water pollution effects, Barytelphusa, Chromates, Chronic toxicity, Dichromate, Physiology, Tissues, Water pollution.

Hexavalent chromium most often appears as a water-soluble chromate or dichromate, both powerful oxidants that can easily penetrate biologic membranes and irritate cells. These compounds are extensively manufactured and utilized by many industries; often they are found in industrial effluents. The in vivo toxic effects of hexavalent chromium (20 mg/L) on hemolymph glucose, tissue glycogen, total free sugars, and active and total phosphorylases of an edible, freshwater crab Barytelphusa guerini were studied. In a 15-day exposure span followed by a 15-day postexposure recovery, the time-course alterations in these constituent segments of the glycogen metabolism indicate an inconsistent depletion in metabolite levels and elevated enzyme activities during exposure period as well as hyperglycemia. The persisting trend of the alterations in glycogen metabolism observed in the tissues of crabs even after their transfer to toxicant-free water suggests the retention and slow elimination of this metal species. However, the pattern of biochemical alterations are not time-dependent, and deviation in responses to Cr(VI) exposure suggests that the differential uptake into tissues and a subsequent redistribution of this anionic metal may possibly account for the varied disturbances in the tissues and reflect the susceptibility of crabs to chromium toxicity. (Mertz-PTT)

EFFECT OF COPPER SULFATE ON HEMATOLOGY, BLOOD CHEMISTRY, AND HEPATO-SOMATIC INDEX OF AN INDIAN CATFISH, HETEROPNEUSTES FOSSILIS (BLOCK), AND ITS RECOVERY.
Andhra Univ. (India). Dept. of Zoology.
K. S. Singh and T. V. Reddy.
Ecotoxicology and Environmental Safety EESADV, Vol. 20, No. 1, p 30-35, August 1990. 1 tab, 25 ref.

Descriptors: *Algicides, *Bioassay, *Catfish, *Copper sulfate, *Fungicides, *Toxicity, *Water pollution effects, Fish, Fish physiology, Heteropneustes, Parasiticide, Tissues, Water pollution.

Copper sulfate is one of the oldest chemicals used as an algacide, a fungicide, and a parasiticide in fish culture, and is commonly considered to be 100% effective. Apart from its help to pisciculturists, it has a serious disadvantage of being toxic to fish. The effect of CuSO4 (0.25 parts per million) on hematology, blood chemistry, and hepato-somatic index was studied in the Indian catfish, Heteropneustes fossilis (Bloch). Analysis of various parameters was made after 24 hours, and 5, 10, 20, and 30 days of CuSO4 exposure. Subsequently, some fish were allowed recovery periods of 24 hours and 5 days in normal water. Fish were normal in the early periods of CuSO4 intoxication, but later they became lethargic and began surfacing frequently to gulp air. There were numerous immature erythrocytes and broken fragments of blood corpuscles visible in the Neubauer chamber when the cells were counted. Physicological functions, such as hematopoiesis, metabolism in general, excretory and respiratory failure, and ionic imbalance were affected. The results indicate that hematological and biochemical parameters and hepato-somatic index values are good indicators of CuSO4 intoxication in H. fossilis (Bloch). (Mertz-PTT)

EFFECT OF 3,4-DICHLOROANILINE AND METAVANADATE ON DAPHNIA POPULATIONS.
Centre for Technology and Policy Studies TNO, Apeldoorn (Netherlands). Dept. of Biology.
N. van der Hoeven.
Ecotoxicology and Environmental Safety EESADV, Vol. 20, No. 1, p 53-70, August 1990. 10 fig, 1 tab, 16 ref, append.

Descriptors: *Bioassay, *Daphnia, *Dyes, *Model studies, *Toxicity, *Water pollution effects, Aquatic populations, Dichloraniline, Growth, Kooijman model, Metavanadate, Pollutants, Population dynamics, Population exposure, Toxicants, Water pollution.

To compare the effects of toxicants on individuals with those on populations, a population model was developed for daphnids based on some facts about the development of individual daphnids and on some more general assumptions. The Kooijman model provides reasonable predictions on the individual level. The parameters in the model have a physical interpretation, making it possible to translate the effect of a toxicant to a change in parameter value. It can only be extended to population levels by extensive computer simulations. Fourteen continuously fed populations of Daphnia magna were exposed to 3,4-dichloroaniline or metavanadate and monitored for 20 (two controls), 14 (six with metavanadate), and 8 (six with 3,4-dichloroaniline) weeks. The controls showed a damped oscillation. Low concentrations of either 3,4-dichloroaniline or metavanadate stimulated the first population peak. High concentrations of metavanadate rendered population peaks less regular, and at the highest metavanadate concentration, one population perished. High concentrations of 3,4-dichloroaniline slightly reduced population size. Four periodically fed populations of D. magna were also monitored. The more they were fed, the larger they grew. In the continuously fed populations, ephippia were formed at and just after the population peaks. No ephippia were noted in the periodically fed populations. Metavanadate promoted the formation of ephippia, and 3,4-dichloroaniline depressed sexual reproduction at all concentrations tested. The population dynamics of the controls were compared with those predicted by Kooijman's model for growth and reproduction of individual daphnids. In general, there is reasonable agreement between model predictions and observations, but some adjustments to the model may be necessary. (Mertz-PTT)

INCORPORATION OF A SUBACUTE TEST WITH ZEBRA FISH INTO A HIERARCHICAL SYSTEM FOR EVALUATING THE EFFECT OF TOXICANTS IN THE AQUATIC ENVIRONMENT.
Swedish Environmental Research Inst., Stockholm.
A. H. Neilson, A. S. Allard, S. Fischer, M. Malmberg, and T. Viktor.
Ecotoxicology and Environmental Safety EESADV, Vol. 20, No. 1, p 82-97, August 1990. 12 tab, 69 ref.

Descriptors: *Bioassay, *Bioindicators, *Chlorinated hydrocarbons, *Fish physiology, *Pesticide toxicity, *Phenolic pesticides, *Toxicity, *Water pollution effects, Hydrogen ion concentration, Testing procedures, Water pollution, Zebra fish.

Single-species laboratory tests were used to assess the acute toxicity of halogenated phenolic compounds. Subacute, preexposure and postexposure tests were examined. 4,5,6-trichloroguaiacol and 3,4,5-trichlorophenol were tested in each system. Other compounds tested included a range of chlorophenols, bromophenols, nitrophenols, 2,4,5-trichloroanisol, 2,4,6-tribromoanisole, and 1,2,3-trichlorobenzene. No single test system was most sensitive to all of the compounds examined, substantial variations in the sensitivity of the various organisms were noted, and there was no correlation between the toxicities assayed with different test systems. The zebra fish (Brachydanio rerio) embryo/larvae system was used to examine subacute effects using two of the compounds, and a protocol was developed with 6 weeks preexposure to the toxicant. Preexposure decreased the lowest observable effect concentration by a factor of about 4, and the effect was completely reversible during a 6-week postexposure period in the absence of the toxicant. An enclosed system for carrying out the zebra fish embryo/larvae test was developed and evaluated with three neutral volatile compounds: the median survival time and the frequency of occurrence of deformation were examined as end points. The effect of pH on toxicity was evaluated in buffered media for four of the test systems: toxicity increased markedly at the lower pH values, and it could be shown that the ionized forms of the phenols were not the only contributors to toxicity. It is proposed that the zebra fish system incorporating preexposure could be incorporated into a hierarchical system using a range of organisms for assessing acute toxicity in single species under laboratory conditions and multicomponent systems simulating natural ecosystems. ENVIRONMENTAL IMPACT OF NORTH SEA OIL.
Dundee Univ. (Scotland). Dept. of Biological Sciences.
A. M. Jones.
Science Progress SCPRAY, Vol. 73, No. 292,4, p 457-468, 1989. 2 fig, 1 tab, 36 ref.

Descriptors: *Environmental effects, *Environmental impact, *North Sea, *Oil industry, Environmental policy, Impact assessment, Oil pollution, Resources development.

The North Sea is a geographically large area of continental shelf water bordered by several countries. It has a surface area of some 575,000 square km and a volume of about 54,000 cubic km. The exploitation of gas began in 1965, while that of oil began in 1969. The development of North Sea oil has been a complex technological exercise and the potentials for impact have been many and varied. The impacts range from the development of the offshore exploration and extraction facilities, often taking place in a hostile environment and at the limits of the current technology, to the socioeconomic consequences of the, often temporary, high-wage economy associated with the construction phase of development. The major threats posed by the development of North Sea oil have so far been avoided through the joint activities of industry, planners and scientists. Most incidents have been local in effect and even in major accidents little real damage has resulted. The unpredictability of many inputs led to a need for monitoring programs to ensure that undesirable trends do not develop in sensitive areas or as a result of new technology being applied. The techniques of monitoring have been the source of much debate and have suffered from a lack of geographical integration: the need for more fundamental understanding of ecological change remains a problem for ecologically based programs. The difficulties of interpretation at the community and/or population level have led to the investigation of more physiological and cellular-level approaches to monitoring which offer considerable promise but which have not yet overcome the general problem of relating the observations to specific contaminants in a multiple-stress situation which is so common. There is good evidence that this approach is valuable, however, in indicating stressed populations and this is an important first step in monitoring objectives. (Mertz-PTT)

SPIROGYRA SPECIES AND ACCOMPANYING ALGAE FROM POOLS AND DITCHES IN THE NETHERLANDS.
Vrije Univ., Amsterdam (Netherlands). Biological Lab.
J. Simons, and A. P. van Beem.
Aquatic Botany AQBODS, Vol. 37, No. 3, p 247-269, August 1990. 4 fig, 10 tab, 33 ref.

Descriptors: *Algae, *Chlorophyta, *Ditches, *Ponds, *Spirogyra, *The Netherlands, *Water pollution effects, Acidity, Alkalinity, Nutrients, Species diversity.

In ditches and moorland pools zygnematacean algae, especially Spirogyra make up an important and often dominant component of floating algae. Of the total number of 60 Spirogyra species recorded in the Netherlands, 47 species were recorded in ditches and pools. Sirogonium was represented by only one species, S. sticticum (Engl. Bot) Wille, and Mougeotia and Zygnema by seven and six species, respectively. In hardwater ditches, especially at sites with relatively low pollution, Spirogyra forms a richly diversified component with up to approximately 20 species per site. At hardwater sites with appreciable pollution Spirogyra is suppressed or replaced by massive growths of algae such as Cladophora, Vaucheria, Enteromorpha or Hydrodictyon. At low alkaline and slightly acid sites, the number of species per site is considerably lower. Under conditions with pH values <5, Spirogyra does not occur and is replaced by Mougeotia, Zygnema, Klebsormidium, Microspora, and some others. Periodicity was observed in Spirogyra with a peak in spore production occurring in the second half of May and the first half of June. Spores were more frequently observed in hardwater habitats than in low-alkaline environments. Most species have wide ranges of occurrence; 22 species were found in low alkaline and slightly acid habitats, but most of these species are not restricted to such environments. Presumably they are adapted to nutrient-poor conditions. In eutrophic hardwater ditches, Spirogyra granulata Jao and S. singularis Nordst. appeared to be very tolerant to pollution. Species such as Spirogyra nitida (Dillw.) Link and S. majuscula Kutz. seem to indicate seepage of groundwater in otherwise nutrient-rich environments. (Author's abstract)

PHOSPHATE (32P)-UPTAKE CAPABILITIES OF NATURAL PICOPLANKTON AND ULTRAPLANKTON COMMUNITIES IN LAKES OF DIFFERING DEGREES OF EUTROPHICATION.
Max-Planck-Inst. fuer Limnologie zu Ploen (Germany, F.R.). Abt. Oekophysiologie.
H. Rai, and T. R. Jacobsen.
Archiv fuer Hydrobiologie AHYBA4, Vol. 118, No. 4, p 421-435, June 1990. 4 fig, 3 tab, 40 ref.

Descriptors: *Aquatic bacteria, *Eutrophic lakes, *Eutrophication, *Germany, *Limnology, *Phosphates, *Phytoplankton, Carbon, Differential fractionation, Orthophosphates, Particle size, Picoplankton, Radioisotopes, Tracer studies, Ultraplankton.

Differential fractionation of P32 as PO4 uptake in North Germany Baltic lakes of varying trophic states was done to distinguish the activity of phytoplankton and bacterioplankton. In all the lakes studied, orthophosphate uptake was overwhelmingly associated with the smallest size particles (<1 microm). Therefore, it is inferred that the bacterioplankton (<1 microm) are responsible for the uptake of orthophosphate in situ conditions, regardless of the ambient phosphorus concentrations of the lakes. P32-uptake kinetics of size-fraction planktonic cells were conducted in mesotrophic Schohsee to determine size preference of phosphate uptake. Uptake rates in the 0.2-10 microm fraction were more than 60% (61-98%) of the 10-250 microm size particles. These findings are consistent with earlier studies that inferred that small cells should have extraordinary uptake capabilities for phosphate. Picoplankton and ultraplankton along with the heterotrophic bacteria are the major trophic groups responsible for phosphate and carbon metabolism in the lakes studied. (Author's abstract)

LONG TERM PATTERNS IN NUTRIENTS, PHYTOPLANKTON AND ZOOPLANKTON OF LAKE KINNERET AND FUTURE PREDICTIONS FOR ECOSYSTEM STRUCTURE.
Kinneret Limnological Lab., Tiberias (Israel).
M. Gophen, S. Serruya, and S. Threlkeld.
Archiv fuer Hydrobiologie AHYBA4, Vol. 118, No. 4, p 449-460, June 1990. 6 fig, 1 tab, 21 ref.

Descriptors: *Eutrophication, *Lake Tiberias, *Limnology, *Nutrients, *Phytoplankton, *Water pollution effects, *Zooplankton, Algae, Fisheries, Israel, Jordan River, Lakes, Monitoring, Nitrogen, Phosphorus.

Long-term records on nutrients, phytoplankton and zooplankton for Lake Kinneret, Israel were examined and indicated that there was reason for concern over future water quality. The discharge of the river and the concentration of major nutrient species in the river were monitored at least once monthly since October 1967 at a station 11 km above the lake and at stations on three Jordan headwater rivers (20-30km above Lake Kinneret). It was concluded that nutrient loading from the Jordan River has changed qualitatively in recent years, with ammonia and soluble phosphorus increasing relative to other forms of nitrogen and phosphorus. Total N in Lake Kinneret has been decreasing and total P has been increasing, resulting in an overall decline in the N:P ratio. Zooplankton biomass has been decreasing, as stocking of commercially favored fish species has increased and fishing pressure on dominant zooplanktivorous fish has decreased. Changes in nutrient loading and in fishery management appear to favor future development of less desireable species of algae in Lake Kinneret. (White-Reimer-PTT)

EPIPHYTIC ZOOBENTHOS DENSITY AND BIOMASS WITHIN LOW ALKALINITY, OLIGOTROPHIC LAKES ON THE CANADIAN SHIELD.
Toronto Univ. (Ontario). Inst. for Environmental Studies.
R. France.
Archiv fuer Hydrobiologie AHYBA4, Vol. 118, No. 4, p 477-499, June 1990. 3 fig, 4 tab, 86 ref.

Descriptors: *Acid rain effects, *Alkalinity, *Benthic fauna, *Canada, *Oligotrophic lakes, *Precambrian Shield, Biomass, Chlorophyll a, Correlation analysis, Depth, Hydrogen ion concentration, Lake morphometry, Light penetration, Littoral communities, Macroinvertebrates, Nitrogen, Ontario, Phosphorus, Population density, Standing crops.

The phytofaunal macroinvertebrate communities within the shallow littoral zones of 19 Ontario Shield lakes were examined during the ice-free seasons of 1984 and 1985. Neither total zoobenthos density nor biomass were linearly correlated with lake pH, alkalinity, total phosphorus (TP), total nitrogen, or chlorophyll-a concentrations. However, the standing crops of several taxa were significantly related to these and other limnological variables without discernable trends with regard to the summed totals. For example, lakes of high alkalinity (>3.5 mg CaCO3/L) had a large percentage of their total biomass composed of gastropods and turbellarians in contrast to lakes of low alkalinity (<1.0 mg/L) which were dominated by odonates and water mites. Secchi depth was the best trophic predictor of total density (r= -0.67) and total biomass (r=-0.63). The possibility of some dependence of littoral zoobenthos on allochthonous energy sources, and the potential for buffering within macrophyte beds, are both unknown, which, together with the narrow range of chemical variables in these lakes (e.g pH from 5.5 to 6.7 and TP from 5 to 14 mg/cu m), may explain the absence of strong chemical correlates of zoobenthos standing crop. There was a hyperbolic relationship between phytofaunal biomass and lake mean depth. The best single predictor of total biomass for the subset of 8 intensively sampled lakes was maximum depth (r=-0.92). The most productive direction towards predicting littoral zoobenthos standing crop may be the development of models relating macroinvertebrates to macrophytes and basin morphometry. Hydrobiologia HYDRB8, Vol. 199, No. 2, p 143-156, July 24, 1990. 6 fig, 4 tab, 34 ref.

Descriptors: *Eutrophic lakes, *Eutrophication, *Georgia, *Phytoplankton, *Primary productivity, *Water pollution effects, *West Point Lake, Algae, Chlorophyll a, Conductivity, Nutrient enrichment, Reservoirs, Seasonal variation, Wastewater pollution.

Mean annual phytoplankton primary productivity of West Point Lake in Atlanta, Georgia, increased significantly during a 10-year period from 1976 (550 mg C/sq m/d) to 1985 (1580 mg C/sq m/d). The increased productivity was apparently caused by nutrient enrichment of the lake waters resulting from the significant increase in volume of treated sewage effluent and urban runoff associated with expanded urbanization of the Atlanta, Georgia, metropolitan area. With the exception of 1985, when conductivity and total phosphorus concentrations were significantly higher, monthly measurements of nutrient concentrations in the headwaters of the reservoir failed to reflect the eutrophication that was occurring. Multiple regression analysis revealed that, during the cool season, chlorophyll a was the most important variable in terms of explaining variations in primary productivity. During the warm season, specific conductance was most important. Volume of treated wastewater entering the reservoir was significantly related to primary productivity during both the cool and warm seasons. Except for 1985 when the mean annual chlorophyll a concentration (19.7 microg/L) was significantly higher than all other years, the chlorophyll content of the lake remained fairly stable (6.9-13.6 microg/L). Increased productivity in the absence of higher algal biomass was caused by more efficient photosynthesis by the algal community. The improved photosynthetic efficiency apparently occurred because of a shift in algal dominance from relatively large diatoms to relatively small green and blue-green taxa. (Author's abstract)

SURVIVAL OF EARLY LIFE STAGES OF BROWN TROUT (SALMO TRUTTA L.) IN RELATION TO ALUMINIUM SPECIATION IN UPLAND WELSH STREAMS.
University Coll., Cardiff (Wales). School of Pure and Applied Biology.
N. S. Weatherley, A. P. Rogers, X. Goenaga, and S. J. Ormerod.
Aquatic Toxicology AQTODG, Vol. 17, No. 3, p 213-229, September 1990. 3 fig, 3 tab, 48 ref, append.

Descriptors: *Acid rain effects, *Fish populations, *Trout, *Water pollution effects, Aluminum, Fish eggs, Hydrogen ion concentration, Lethal limit, Survival.

The survival of artificially implanted eggs, alevins and parr of brown trout (Salmo trutta (L.)) was assessed in streams of different acidity. Chemical analysis included detailed aluminum speciation of surface and interstitial water samples, taken over the duration of intragravel life stages. Egg survival, from two minutes after fertilization to hatching, was usually above 71%, and was independent of the mean concentration of total monomeric aluminum over the range 3-397 micrograms/L. The survival of alevins exposed for 28 days (before 'swim up') or 42 days ('swim up') was most strongly related to mean monomeric aluminum concentration and to pH. For 28 and 42 day exposures, LC50 values for monomeric aluminum were approximately 19 and 15 micrograms/L, respectively, or 79 and 72 micrograms/L for 0.45 micrometer filterable aluminum. The 21 day LC50 of parr ca. 3 month old, was between 84 and 105 micrograms/L mean filterable aluminum concentration. During a simulated acid episode of mean pH 4.8 and 880 micrograms filterable aluminum/L parr showed 100% mortality after 18 hours. As exemplified in this study, chemical variables show wide and rapid fluctuations, and are often co-correlated. These features confuse interpretation of field experiments or prediction from laboratory data. (Author's abstract)

MOLLUSCICIDAL AND PISCICIDAL PROPERTIES OF COPPER(II) TETRAOXOSULFATE(VI) ON BULINUS GLOBOSUS (MORELET) AND CLARIAS ANGUILLARIS (L).
Ahmadu Bello Univ., Zaria (Nigeria). Dept. of Biological Sciences.
J. Ebele, A. A. Oladimeji, and J. A. Daramola.
Aquatic Toxicology AQTODG, Vol. 17, No. 3, p 231-238, September 1990. 5 fig, 16 ref.

Descriptors: *Copper compounds, *Fish, *Snails, *Toxicology, *Water pollution effects, Bioaccumulation, Bioassay, Copper tetraoxosulfate, Ecotoxicology, Fish physiology, Gills, Lethal limit, Toxicity.

The lethal effects of a chemical molluscicide, copper(II) tetraoxosulfate (VI), on Clarias anguillaris and Bulinus globosus were investigated. The fish were exposed to various concentrations of the chemical in 48, 72 and 96-h static bioassay, while the exposure time for the snails was 24 hours. The LC50 for the various treatments were calculated after corrections were made for natural responsiveness. The molluscicidal concentration was found to be lower than the piscicidal concentration. The histopathology of the gills of the fish revealed a general damage of the gill filaments probably leading to impairment of ion and oxygen uptake. Even though the molluscicidal concentration of copper(II) tetraoxosulfate is sublethal to C. anguillaris, consideration should be given to a long term accumulation of copper in the fish which in the end might reach the lethal concentration for the fish. Furthermore there exists the danger of subsequent passage of copper along the trophic chain which, in this case involves man. (Lantz-PTT)

The relative biological response (log BR) for each of 30 select substitute phenols and anilines was evaluated using the 48-h Tetrahymena pyriformis population growth test system. Simple linear regression analysis of log BR versus log Kow (1-octanol/water partition coefficient) was used to formulate a quantitative structure-activity relationship (QSAR). The equation, log BR = 0.438 (log Kow) + 0.157; n = 27, r-squared = 0.933, s = 0.151, f = 348.02, is a highly predictive model. An evaluation of data on fathead minnow mortality for these same compounds shows a similar QSAR, log LC50 = -0.590(log Kow) -3.247; n = 11, r-squared = 0.917, s = 0.287, f = 99.04. These relationships are the respective QSARs for the respiratory uncoupling mechanism of action of selected weak acids. Moreover, the toxic response in the two systems are highly correlated (r-squared = 0.915). (Author's abstract)

EFFECT OF CADMIUM ON VITELLOGENIN METABOLISM IN ESTRADIOL-INDUCED FLOUNDER (PLATICHTHYS FLESUS (L.)) MALES AND FEMALES.
Odense Univ. (Denmark). Biological Inst.
A. F. Povlsen, B. Korsgaard, and P. Bjerregaard.
Aquatic Toxicology AQTODG, Vol. 17, No. 3, p 253-262, September 1990. 4 fig, 3 tab, 24 ref.

Descriptors: *Cadmium, *Fish physiology, *Flounders, *Vitellogenin, *Water pollution effects, Bioaccumulation, Biological studies, Estradiol, Liver, Toxicity.

The hepatic synthesis of vitellogenin can be induced in male teleosts by treatment with estradiol. During vitellogenesis in nature the metabolic demand on the liver of the female teleost is very large, considering that the weight of the ovary may increase to one-fourth or more of the body weight due to vitellogenic growth of the oocytes. It is well established that cadmium accumulates in the liver and kidney of teleost fish and may induce synthesis of metallothioneins in the liver. One injection of 2 mg cadmium/kg body wt reduced the ratio of RNA to DNA in the liver to less than half of the control value and significantly depressed the concentration of vitellogenin in the plasma of estradiol-injected female flounders. A dose of 0.5 mg cadmium/kg body wt had no effect. In estradiol-induced flounder males cadmium treatment had a significant reducing effect on the level of circulating vitellogenin in the combined estradiol-cadmium treated group compared to the estradiol treated group. No effect of cadmium was observed on the ratio of hepatic RNA to DNA in the male fish. By gel fractionation, it was found that 88% of the accumulated cadmium in the cadmium estradiol treated group and only 49% in the cadmium treated group were bound to small cytosol proteins (metallothioneins) indicating that estradiol interferes with the cadmium accumulating ability of the liver. METABOLIC RESPONSE OF GRASS SHRIMP PALAEMONETES KADIAKENSIS RATHBUN, TO ACUTE EXPOSURE OF SUBLETHAL CHANGES IN PH.
Texas A and M Univ., College Station. Dept. of Biology.
D. L. McCulloch.
Aquatic Toxicology AQTODG, Vol. 17, No. 3, p 263-274, September 1990. 4 fig, 1 tab, 49 ref.

Descriptors: *Acid rain effects, *Hydrogen ion concentration, *Shrimp, *Sublethal effects, *Water pollution effects, Animal physiology, Bioassay, Biological studies, Oxygen, Stress, Toxicity.

The effects of sublethal changes in environmental pH on the grass shrimp Palaemonetes kadiakensis were determined using changes in metabolic rate and critical oxygen concentration as indicators of stress. Oxygen consumption was measured using a computer automated intermittent flow respirometer which allowed multiple sampling of a single individual without exposing it to prolonged oxygen stress. Metabolic rate and critical oxygen concentration were determined using a quadratic model with plateau nonlinear regression procedure. Sublethal changes in pH (6.5, 9.0) did not have a significant effect on metabolic rate. Temporary disturbances in hemolymph acid-base status caused by acute pH stress, may not elicit a metabolic response when not accompanied by necrosis of the gill epithelium. An effect of pH on the critical oxygen concentration was found. When the pH was 6.5, significantly higher than the control (pH 7.8), or 9.0, significantly lower than the control. Shifts in critical oxygen concentration were attributed to changes in blood oxygen affinity caused by hemolymph acidosis or alkalosis. (Author's abstract)

EFFECTS OF SUBLETHAL EXPOSURE TO CHLORINE ON THE UPTAKE OF POLYCHLORINATED BIPHENYL CONGENERS BY RAINBOW TROUT, SALMO GAIRDNERI (RICHARDSON).
Tennessee Univ., Knoxville. Graduate Program in Ecology.
M. C. Black, and J. F. McCarthy.
Aquatic Toxicology AQTODG, Vol. 17, No. 3, p 275-289, September 1990. 6 fig, 1 tab, 31 ref. DOE Contracts DE-AC06-76OR00033 and DE-AC05-84OR21400.

Descriptors: *Chlorine, *Polychlorinated biphenyls, *Sublethal effects, *Trout, *Water pollution effects, Bioassay, Biological studies, Ecotoxicology, Fish physiology, Gills, Oxygen, Toxicity.

Chlorine-induced changes in fish gill histopathology and respiration may alter the uptake of co-contaminants which are accumulated by passive diffusion across gill membranes. The effect of chlorine exposure on gill histopathology, respiratory functions, and uptake if three polychlorinated biphenyl (PCB) congeners by rainbow trout (Salmo gairdneri) were determined. Trout gill lamellar lesions occurring during a 24-h exposure to 0.04 mg/L chlorine included proliferation of mucous cells, hyperplasia of epithelial cells, clubbed lamellae, and lamellar fusion. These types of pathological changes would be expected to result in increased diffusion distances of the gill membrane and decreased functional gill surface area. Reductions in oxygen and PCB uptake efficiencies measured in concomitant exposures to chlorine and PCBs using a fish metabolic chamber were consistent with the histopathological results. Increases in trout ventilation compensated for the lowered uptake deficiencies. As a result of ventilatory compensation, there was little change in the oxygen consumption for PCB accumulation by trout throughout the exposure to chlorine. Correlations between oxygen and PCB uptake may provide a basis for estimating toxicant uptake using oxygen uptake data as the basis for extrapolation. (Author's abstract)

LIBRARY U. OF I. URBANA-CHAMPAIGN

namics, *Water pollution effects, Algae, Algal blooms, Colorado, Nitrates, Photosynthesis, Rocky Mountains, Snowmelt.

In 1984 and 1985 seasonal changes in phytoplankton were studied in a system of three lakes in Loch Vale, Rocky Mountain National Park, Colorado, to determine the effects of urban atmospheric deposition. Three periods were evident: (1) A spring bloom, during snowmelt, of the planktonic diatom Asterionella formosa, (2) a midsummer period of minimal algal abundance, and (3) a fall bloom of the blue-green alga Oscillatoria limnetica. Seasonal phytoplankton dynamics in these lakes are controlled partially by the rapid flushing rate during snowmelt and the transport of phytoplankton from the highest lakes to the lower lakes by the stream, Icy Brook. During snowmelt, the A. formosa population in the most downstream lake has a net rate of increase of 0.34/d, which is calculated from the flushing rate and from the A. formosa abundance in the inflow from the upstream lake and in the downstream lake. Measurement of photosynthetic rates at different depths during the three periods confirmed the rapid growth of A. formosa during the spring. The decline in A. formosa after snowmelt may be related to grazing by developing zooplankton populations. The possible importance of seasonal variations in nitrate concentrations were evaluated in in situ enrichment experiments. For A. formosa and O. limnetica populations, growth stimulation resulted from 8 or 16 micromolar amendments of calcium nitrate and sulfuric acid, but the reason for this stimulation could not be determined from these experiments. RELATIONSHIPS AMONG DEPTH TO FROZEN SOIL, SOIL WETNESS, AND VEGETATION TYPE AND BIOMASS IN TUNDRA NEAR BETHEL, ALASKA, U.S.A.
Gettysburg Coll., PA. Dept. of Biology.
M. F. Gross, M. A. Hardisky, J. A. Doolittle, and V. Klemas.
Arctic and Alpine Research ATLPAV, Vol. 22, No. 3, p 275-282, August 1990. 3 fig, 3 tab, 51 ref. NASA Biospheric Research Program Grant NAGW-374.

Descriptors: *Air pollution effects, *Alaska, *Biomass, *Frozen ground, *Global warming, *Soil water, *Vegetation, Bethel, Soil environment, Tundra.

Investigators in this program participated in NASA's Biospheric Research Program Global Tropospheric Experiment (GTE) in Alaska in order to assess gas flux and vegetation characteristics of moist and wet tundra. Because wetland soils are often anaerobic, much of the organic carbon produced by wetland vegetation and buried when the vegetation dies decomposes under anoxic conditions. Among the gases released during decomposition is methane, a 'greenhouse gas' the concentration of which is increasing globally at the rate of about 1% per year. Wet tundra and its vegetation may play a major role in future biogeochemical cycling because there is a larger component of buried, partially decomposed organic matter in tundra soils, and because most models suggest that warming induced by the greenhouse effect will be relatively large in polar regions. The organic matter is not decomposing rapidly at present because of cold soil temperatures. In order to detect any future additional gas flux caused by greenhouse-effect warming, it is first necessary to have baseline data on current gas flux. Carbon sequestering through photosynthesis, and released through respiration, are strongly influenced by vegetation and temperature, including the effect of temperature on the depth of the biologically active layer. Therefore, changes in gas flux can, theoretically, be inferred by changes in vegetation condition (biomass or species distribution) or in depth of the thawed layer. Assessing changes in the tundra on a global scale will require the use of remote sensing to study vegetation and depth to frozen soil. Ground-penetrating radar (GPR) is a rapid, accurate way of measuring thickness of the active layer and depth to frozen soil remotely, while vegetation type can be surveyed for a large area of tundra quickly using satellite imagery. If any consistent relationship exists among vegetation type, biomass, soil wetness, and depth to frozen soil in tundra in the Bethel region of southwestern Alaska, a remote sensing-based assessment of vegetation type or of depth to frozen soil could possibly be used as a predictor of gas flux. IMPLICATIONS OF AQUATIC ANIMAL HEALTH FOR HUMAN HEALTH.
Harvard Medical School, Boston, MA. Dept. of Pathology.
C. J. Dawe.
Environmental Health Perspectives EVHPAZ, Vol. 86, p 245-255, June 1990. 1 tab, 78 ref.

Descriptors: *Aquatic animals, *Environmental protection, *Path of pollutants, *Public health, *Public policy, *Water pollution effects, Environmental policy, Management planning, Policy making, Water pollution prevention.

Human health and aquatic animal health are organically related at three distinct interfaces. Aquatic animals serve as important contributors to the nutritional protein, lipid and vitamin requirements of humans; as carriers and transmitters of many infections and parasitic diseases; and as indicators of toxic and carcinogenic substances that they can convey, in some part from aquatic environments to humans and other terrestrial animals. Transcending these relationships, but less visible and definable to many, is the role that aquatic animals play in the sustenance of this integrated planetary ecosystem. The negative values of aquatic animals as disease vectors are far outweighed by their positive values as nutritional sources and as sustainers of a relatively stable equilibrium in the global ecosystem. In the immediate future, increased and improved monitoring of aquatic habitats can be expected to determine the extent to which aquatic animals cycle anthropogenic toxic and carcinogenic chemicals back to human consumers. In the long-term, methods are particularly needed to assess the effects of these pollutants on reproductive success in aquatic communities and in human communities as well. As inputs of habitat-degrading substances change in quality and quantity, it becomes increasingly urgent to evaluate the consequences in advance, not in retrospect. A new, more realistic and comprehensive philosophy regarding aquatic environmental preservation and equally new and comprehensive philosophy technological advances reflective of this philosophy will be required. FISH HEALTH AND ENVIRONMENTAL HEALTH.
National Marine Fisheries Service, Woods Hole, MA. Northeast Fisheries Center.
R. A. Murchelano.
Environmental Health Perspectives EVHPAZ, Vol. 86, p 257-259, June 1990. 22 ref.

Descriptors: *Bioindicators, *Biomonitoring, *Cancer, *Fish, *Monitoring, *Water pollution effects, Bioaccumulation, Boston Harbor, Flounders, Water quality.

Surveys conducted to evaluate the health of marine bottom fishes have been conducted in the eastern and western North Atlantic for the past 15 years, usually in conjunction with fish stock assessment cruises. The health of the fish sampled was evaluated using certain integumental and skeletal lesions and anomalies as markers to signify compromised health status. The results of these surveys indicate that fish health is poorer in coastal waters that have been anthropogenically degraded. Monitoring programs to determine the status and trends in levels in inorganic and organic contaminants in fish tissue and sediments have disclosed high levels of chemical contaminants in several coastal areas of the northern US. Histopathological examination of liver tissues of winter flounder, Pseudopleuronectes americanus, from Boston Harbor, one of the more chemically contaminated sites, has revealed a high prevalence of hepatocarcinoma. ALUMINUM IN DOMESTIC WATER: OVERLOAD MAY BE HAZARDOUS TO DIALYSIS PATIENTS.
Louisiana State Univ. Medical Center, Shreveport.
K. Abreo, M. Sella, and S. T. Brown.
Journal of Environmental Health JEVHAH, Vol. 52, No. 5, p 289-290, March/April 1990. 1 fig, 1 tab, 16 ref.

Descriptors: *Aluminum, *Dialysis, *Domestic water, *Kidneys, *Louisiana, *Public health, *Water treatment, Clarification.

Since contamination of dialysis water can be a major source of aluminum accumulation, aluminum content was measured in domestic and dialysis water in all 59 dialysis units in Louisiana, and correlated with red cell indicies, a reversible marker of aluminum overload. Findings suggest that aluminum sulfate added to domestic water as a coagulant was responsible for increased aluminum levels. Since high aluminum levels pose a potential risk to patients with renal failure, aluminum free chemicals should be used for water clarification. Results of this study suggest that there is an increased likelihood of high aluminum content in domestic or drinking water derived from slowly flowing or stagnant surface sources to which aluminum sulfate has been added for clarification. Water treatment facilities could lower aluminum content of water by utilizing non-aluminum containing coagulants. (Lantz-PTT)

RELATIONS BETWEEN ACID RAIN AND VESICULAR-ARBUSCULAR MYCORRHIZA.
Utrecht Rijksuniversiteit (Netherlands). Dept. of Plant Ecology.
B. Heijne, G. W. Heil, and D. van Dam.
Agriculture, Ecosystems and Environment AEENDO, Vol. 29, No. 1-4, p 187-192, February 1990. 3 tab, 14 ref.

Descriptors: *Acid rain effects, *Air pollution effects, *Fungi, *Grasses, *Nitrogen, *Phosphorus, *Potassium, *The Netherlands, Nitrogen oxides, Sulfur dioxide, Vesicular-arbuscular mycorrhiza.

In the Netherlands, the air pollution of SO2 and NOx generally increases from the northwest to the southeast. Plants from dry grass heathland (Violion caninae) were sampled in May and at the end of September 1987, in both northern and southern Netherlands. Percentages of root length infected with vesicular-arbuscular mycorrhiza were calculated. Determination of nitrogen, phosphorus and potassium content of shoots and roots indicated there was a seasonal effect. In spring vesicular arbuscular mycorrhiza infection was lower than at the end of the summer. Plants of Viola canina which grew close to the border of an arable field (1-2 m), had a lower vesicular-arbuscular mycorrhiza infection than those growing the center of the heather vegetation. No correlation was found between the amount of vesicular-arbuscular mycorrhiza infection and the amount of acid rain as determined by the National Institute of Public Health and Environmental Hygiene. In shallow coastal waters certain dissolved or suspended particulate chemicals may become concentrated in seagrass beds. Tributyltin, released to marine waters from certain antifouling paints, has come under recent regulation because of high toxicity and growing use. (C14)-labeled tributyltin chloride (TBT-Cl) was delivered to the water column of seagrass (Thalassia testudinum) microcosms held in the laboratory under flow-through conditions. Benthic macroinvertebrate abundances across a three treatment logarithmic dose gradient were compared to untreated control microcosms. Within 3 to 6 weeks, statistically significant mortality appeared in the high treatment (22.2 microg/L). Sensitive species included surface deposit feeders of several phyla, as well as a suspension feeding mollusk. Results suggested that effects can arise because TBT is rapidly accumulated in surface sediments, as well as in Thalassia tissues. Concentration of tracer in plant tissues, animals, and sediments suggested that measurement of TBT (and total butyltin) in these components of seagrass beds would provide a better indicator of exposure regimes than occasional measurements in the water. A propensity for accumulation, along with a biological vulnerability, suggests a sentinel role for seagrass ecosystems in some shallow coastal areas. Experimental findings demonstrated concern for some key invertebrates within beds proximal to TBT sources, and ecological risks could radiate through webs dependent on these vegetated shallows. INTEGRATION OF LONG-TERM FISH KILL DATA WITH AMBIENT WATER QUALITY MONITORING DATA AND APPLICATION TO WATER QUALITY MANAGEMENT.
Post, Buckley, Schuh and Jernigan, Inc., Columbia, SC.
A. H. Trim.
Environmental Management EMNGDC, Vol. 14, No. 3, p 389-396, March/April 1990. 3 fig, 3 tab, 13 ref.

Descriptors: *Coastal zone management, *Estuarine fisheries, *Fishkill, *Monitoring, *Pesticides, *Statistical analysis, *Water pollution effects, *Water quality management, Coastal waters, Data interpretation, Water pollution sources.

Almost half (354) of all fish kills (805) in South Carolina, between 1978 and 1988 occurred in the coastal zone. These kills were analyzed for causative, spatial, and temporal associations as a distinct data set and integrated with ambient water quality monitoring data. Estuarine kills as a result of natural causes accounted for 42.8% followed by man-induced (35.1%) and undetermined causes (22.1%). Although general pesticide usage was responsible for 53.9% of man-induced kills, weed control activities around resorts and municipal areas accounted for slightly more kills (20.9%) than did agricultural (19.8%) or vector control (13.2%) uses. A dramatic decline in agricultural-related kills has been observed since 1986 when the integrated pest management approach was adopted by many farmers. When taken with the few kills (12.0%) resulting from wastewaters, this suggests that these two land-use activities have been successfully managed via existing programs (IPM and NPDES, respectively) to minimize their contributions to estuarine fish kills. Ambient trend monitoring data demonstrated no coastal-wide dispersion of pesticide pollution. These data confirmed the nature of fish kills to be site-specific, near-field events most closely associated with the contiguous land-use practices and intensities. Typically, fish kill data are considered as event-specific data related to that event only. This analysis has shown, however, that a long-term data set, when integrated with ambient water quality data, can assist in regulatory and resource management decisions for both short-term and long-term planning and protection applications. Descriptors: *Alkoxyresorufin, *Bioassay, *Bioindicators, *Water pollution effects, Biochemistry, Chlorinated hydrocarbons, DDT, Dioxins, Monitoring, Organic compounds, Pesticides, Polycyclic aromatic hydrocarbons, Rats.

Methods of biochemical monitoring of individual animals for exposure to environmental contaminants are of great potential use. The hepatic metabolism of various alkoxyresorufins, which are highly specific substrates for certain forms of cytochrome(s) P450, is highly induced by a variety of environmental contaminants. Thus, the o-dealkylation of pentoxy-, or benzyloxyresorufin was induced greater than 20-fold in the rat by alpha-hexachlorocyclohexane, 2,4,5,2',4',5'-hexabromobiphenyl, DDT and Aroclor-1254, while the metabolism of ethoxyresorufin was highly induced by 5,6-benzoflavone, 3,4,5,3',4',5'-hexabromobiphenyl and Aroclor-1254. Additionally, rats exposed to diets containing as little as 12 ppm DDT displayed >5 fold increase in the rate of hepatic o-dealkylation of benzyloxyresorufin. Induction of the hepatic

LIBRARY U. OF I. URBANA-CHAMPAIGN

metabolism of these resorufin ethers in 9000 xg supernatant fractions taken from rats exposed to potential environmental contaminants may constitute a valuable diagnostic indicator of the presence of a variety of pollutants, including polycyclic aromatic hydrocarbons, organochlorine pesticides, polyhalogenated biphenyls and 2,3,7,8-tetrachlorodibenzo-p-dioxin. These results suggest the potential applicability of these substrates in detecting chemical contamination in the environment. (Author's abstract)

Descriptors: *Antifoulants, *Bass, *Pesticides, *Toxicity, *Tributyltin, *Water pollution effects, Bioassay, Biological studies, Ecotoxicology, Larvae, Mortality, Nucleic acids.

Three experiments were conducted on the effects of tributyltin (TBT). In the first experiment, thirteen day old larvae were exposed to 0, 0.067, 0.766, or 2.284 micrograms TBT/L for six days. All larvae exposed to 2.24 micrograms/L died by day 5; exposure to 0.766 micrograms/L significantly reduced survival relative to controls (59.8% vs. 81.8%). Significant, concentration dependent decreases in body depth occurred in larvae exposed to 0.067 and 0.766 micrograms/L. In experiment 2, all 16 day old larvae exposed to 1.489 micrograms/L died by day 6. Survival, weight, and morphometry parameters were not significantly different in larvae exposed to 0, 0.052, or 0.444 micrograms/L for 7 days. Notochord length and dry weight decreased significantly in larvae exposed to 0.514 micrograms/L. Weight and morphometry parameters were more sensitive indicators of sublethal stress than RNA-DNA ratio. Maximum TBT concentrations reported in Chesapeake Bay marinas are likely to cause increased larval mortality. Longer term studies are needed to assess effects at <0.050 micrograms/L, which may be more representative of habitat conditions. (Author's abstract)

EFFECTS OF ACID-MINE DRAINAGE ON THE CHEMICAL AND BIOLOGICAL CHARACTER OF AN ALKALINE HEADWATER STREAM.
Thomas Hunt Morgan School of Biological Sciences, Lexington, KY.
T. M. Short, J. A. Black, and W. J. Birge.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 2, p 241-248, March/April 1990. 3 fig, 3 tab, 46 ref. Kentucky Natural Resources Memorandum of Agreement No. 5429.

Descriptors: *Acid mine drainage, *Benthic fauna, *Heavy metals, *Water pollution effects, Aluminum, Biological studies, Chemical analysis, Chubs, Copper, Fish, Headwaters, Hydrogen ion concentration, Iron, Kentucky, Manganese, Midges, Zinc.

Distribution of metals in water and sediments, as the well as spatial alteration in benthic macroinvertebrate and fish assemblages, was assessed in an alkaline headwater stream in eastern Kentucky receiving runoff from an abandoned surface mine. Concentrations of aluminum, copper, iron, manganese, and zinc generally increased 2 to 3 orders of magnitude in the receiving water immediately below where the mine runoff entered the creek. Metals in the water column were transported downstream largely in association with suspended particulates, and declined in concentration progressively in a linear fashion commensurate to distance below the mine drainage outfall. In contrast, metal enrichment of sediments occurred spatially in a non-incremental pattern and varied among locations in conjunction with site specific changes in concentration levels of sediment organic matter. Benthic macroinvertebrate and fish fauna were eliminated for a distance of 0.3 km below the outfall, presumably owing to the presence of high levels of dissolved metals and low pH. Recovery of stream benthos occurred 1.0-2.0 km further downstream and was characterized by numerical dominance of collector-gatherer trophic groups consisting primarily of midge larvae (Chironomidae: Orthocladiini). Fish fauna in downstream reaches consisted exclusively of creek chubs (Semotilus atromaculatus) and stoneroller minnows (Campostoma anomalum). Metal levels in water and sediments remained elevated in regions of biological recovery and, as a consequence, downstream communities were comprised predominantly of metal tolerant taxa. Descriptors: *Biochemistry, *Carp, *Pesticides, *Water pollution effects, Biological studies, Copper sulfate, Enzymes, Fish physiology, Liver, Methidathion, Paraquat, Tissue analysis.

Treatments with copper sulfate (CuSO4), paraquat (PQ) and methidathion (MD) caused tissue damage and stress effects in carp. These effects were indicated by increased lactate dehydrogenase (LDH), glutamic oxaloacetic transaminase (GOT), and glutamate dehydrogenase (GIDH) enzyme activities and elevated blood sugar levels. Copper sulfate, administered together with PQ and MD, was synergistic in terms of tissue damage and stress effects. Isoenzyme patterns showed organ-specific tissue damage, and the administered chemical and isoenzymes indicating liver damage were detectable in the blood. The combination of CuSO4 and MD caused local cell necrosis, which was observable in the liver tissue by light microscopy. Electron microscopic studies revealed the presence of damaged parenchymal cells with electron transparent cytoplasms, myelin figures, and altered mitochondria ER and Golgi. (Author's abstract)

Descriptors: *Albedo, *Carbon dioxide, *Climatology, *Data interpretation, *Global warming, *Model studies, Air temperature, Computer models, Ice, Oceans, Snow, Temporal variation.

A model (altered from a revised 1984 version) is run to equilibrium for 1 X CO2 and 2 X CO2 experiments. The 1 X CO2 (control) simulation produces a global mean climate (GCM) that is about 1 degree warmer than the original version, and sea ice extent is reduced. The model with the altered parameterization displays heightened sensitivity in the global means, but the geographical patterns of climate change due to increased CO2 are quantitatively similar. The magnitude of the climate change is affected not only in areas directly influenced by snow and ice changes, but also in other regions of the globe, including the tropics where sea surface temperature, evaporation and precipitation over the oceans is greater. With the less sensitive formulation, the global mean surface air temperature increase is 3.5 C and the increase of global mean precipitation is 7.12%. The revised formulation produces a globally averaged surface air temperature increase of 4.04 C and a precipitation increase of 7.25%, as well as greater warming of the upper tropical troposphere. Sensitivity of surface hydrology is qualitatively similar between the two cases with the larger magnitude changes in the revised snow and ice-albedo scheme experiment. Variability of surface air temperature in the model is comparable to observations in most areas except in high latitudes during winter. In those regions, temporal variation of the sea-ice margin and fluctuations of snow cover dependent on the snow ice-albedo formulation contribute to larger than observed temperature variability. This study highlights an uncertainty associated with results from current climate GCMs that use highly parameterized snow-sea-ice albedo schemes with simple mixed layer ocean models. Descriptors: *Aquatic life, *Bioassay, *Dyes, *Toxicity, *Water pollution effects, Algae, Amphipods, Aquatic insects, Comparison studies, Crustaceans, Fish, Invertebrates, Midges, Solvent green 3, Solvent yellow 33, Waterfleas.

The toxicity of Solvent Yellow 33 and Solvent Green 3 mixtures used as components of smoke munitions by the military was studied. The acute toxicity of the dyes to an array of nine freshwater aquatic organisms from various trophic levels was determined. Fish exposed to the two dyes for 96 h included the fathead minnow (Pimephales promelas), bluegill (Lepomis macrochirus), channel catfish (Ictalurus punctatus) and rainbow trout (Salmo gairdneri). Invertebrates, which were exposed for 48 h, included the water flea (Daphnia magna), amphipod (Gammarus pseudolimnaeus), midge larva (Paratanytarsus parthenogeneticus) and the mayfly larva (Hexagenia bilinata). Growth of the green alga Selenastrum capricornutum was also determined for both dyes. Solvent Yellow 33 and s Solvent Green 3 mixture (30:70 mixture of Solvent Yellow 33 and Solvent Green 3) were not acutely toxic to seven of nine freshwater species when tested at the solubility limits of the dyes in freshwater. A solubility limit solution of the Solvent

Green 3 mixture killed 50% of the rainbow trout ested for 96 hr but was nontoxic when diluted by 50%. Both dyes caused a reduction in green algal growth at solubility limits. The Solvent Green 3 mixture was the most detrimental causing a 98-99% reduction in growth after 5 days of exposure. (Agostine-PTT)

Descriptors: *Eutrophic lakes, *Eutrophication, *Japan, *Midges, *Sedimentation rates, *Water pollution effects, Anaerobic conditions, Benthos, Biomass, Lake sediments, Larvae.

Larval chironomid, Tokunagayusrika akamusi, were reared in submerged glass bottles in Lakes Teganuma and Kasumigaura, central Japan. The larvae neither grew nor survived in very hypertrophic Lake Teganuma, though they grew and survived well in the less hypertrophic Lake Kasumigaura. Anaerobic conditions of the sediment in the rearing bottles of Lake Teganuma, which were induced by high sedimentation rates of newly deposited matter, were responsible for the complete mortality of the larvae. Anaerobic conditions were also observed in the sediment surface of Lake Taganuma. It was suggested that even in shallow lakes fully circulated by wind, hypertrophic conditions accompanied by massive primary production may depress macrozoobenthos biomass through anaerobic conditions in the lake-bottom sediments. D. Dean-Ross.
Canadian Journal of Microbiology CJMIAZ, Vol. 36, No. 8, p 561-566, August 1990. 5 fig, 2 tab, 23 ref.

Descriptors: *Aquatic bacteria, *Path of pollutants, *Species diversity, *Water pollution effects, *Zinc, Heavy metals, Resistance, Streams, Tolerance, Toxicity.

To study the response of natural communities of attached bacteria to Zn, artificial streams were dosed with Zn at levels of 0, 0.01, 0.1, 0.5, 1.0, and 10.0 mg/L in duplicate treatment groups. Changes in total biomass, chlorophyll a content, total bacterial numbers, and heterotrophic activity were measured over a 5-week exposure period. The adaptation of the culturable bacterial community to Zn was assessed by comparing viable counts on unsupplemented medium with counts on media supplemented with several concentrations of Zn. The structure of that portion of the bacterial community capable of growth on nutrient agar was assessed by characterizing randomly selected colonies with respect to 20 nutritional capabilities and grouping the strains by numerical taxonomy. Streams receiving 0.5, 1.0, and 10.0 mg Zn/L were significantly inhibited with respect to all variables studied when compared with streams receiving 0, 0.01, or 0.1 mg Zn/L. Bacteria developed tolerance to the exposure concentration of Zn but were resistant to higher Zn concentrations. Increasing concentrations of Zn produced alterations in the structure of the culturable bacterial community, resulting in differing assemblages of bacterial groups and a decrease in diversity as measured by the Shannon-Wiener index and rarefaction. These results suggest that streams receiving 0.5 mg Zn/L or more may be adversely impacted. (Author's abstract)

Descriptors: *Ducks, *Hormones, *Oil pollution, *Thyroid, *Toxicology, *Water pollution effects, Ecological effects, Enzymes, Metabolism, Oil.

Ingestion of Statfjord A crude oil from the North Sea has no apparent effect on the metabolic rate of ducks according to previous studies. This may be because this particular oil does not affect plasma concentrations of thyroid hormones and enzyme activities in the mixed function oxidase (MFO) system of ducks. To test this hypothesis, plasma concentrations of thyroid hormones (thyroxine and triiodothyronine), and levels of hepatic cytochrome P-450 and enzyme activities (NADPH cytochrome C reductase and GSH-S-transferase) in the MFO system were measured in domestic ducks (Anas platyrhynchos) which had ingested this crude oil. Daily oral dosing of 5 ml crude oil/kilogram body weight for 6 consecutive days resulted in a 53% increase in plasma triiodothyronine concentration and a 56% increase in the hepatic cytochrome P-450 level. The changes in these parameters were apparently not sufficient to cause any rise in metabolic heat production. This apparent contradiction is probably because activation of the MFO-system is energetically inexpensive. Also, possible metabolic effects caused by increased plasma-triiodothyronine concentration and activation of the MFO-system may have been masked by an inhibitory effect of the crude oil on mitochondrial electron transport and coupled phosphorylation. Freshwater cichlids Oreochromis mossambicus (tilapia) were exposed to 10 micrograms Cd/L in ambient water for 2, 4, 14, and 35 days. Plasma cortisol and glucose levels were determined to evaluate if cadmium induced a typical stress response in these fish. Exposure to cadmium for 2, 4, and 14 days elicited a significant elevation of plasma cortisol levels. A significant hyperglycemia occurred on days 2 and 4 in cadmium-exposed fish. During long-term exposure to cadmium (35 days), the plasma cortisol and glucose levels returned to control values. This recovery after 35 days indicates the ability of tilapia to adapt to low cadmium concentrations in the ambient water. (Author's abstract)

MORPHOLOGICAL DEFORMITIES IN CHIRONOMIDAE(DIPTERA) LARVAE FROM THE LAC ST. LOUIS AND LAPRAIRIE BASINS OF THE ST. LAWRENCE RIVER.
National Hydrology Research Inst., Saskatoon (Saskatchewan).
W. F. Warwick.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 185-208, 1990. 9 tab, 8 fig, 42 ref.

Descriptors: *Aquatic insects, *Heavy metals, *Midges, *Polychlorinated biphenyls, *St Lawrence River, *Toxic wastes, *Water pollution effects, Benthos, Ecological effects, Larvae, Species diversity, Wastewater pollution, Water pollution sources.

Morphological deformities in chironomid communities were compared with indices of chemical contamination in the Lac St. Louis and Laprairie Basins of the St. Lawrence River. The most severely deformed larvae in Lac St. Louis were found in close proximity to the industrial complex around Beauharnois, Quebec, an area known to be seriously contaminated by polychlorinated biphenyls and heavy metals. Further away, and particularly in areas shielded from the main flow of the St. Lawrence by the Iles de la Paix complex, the frequency and severity of deformities decreased. Interpretation of contaminant responses was less easily accomplished in the Laprairie basin where the introduction of untreated domestic sewage imposed extremely severe environmental conditions for benthos. Comparison of contemporary and subfossil community diversities indicated that extensive changes have taken place in the structure of these communities in recent times. The presence of deformities in contemporary chironomid communities suggests that these changes have been brought about by chemical contaminants. (Author's abstract)

Effects of acidification on leaf decomposition in streams were studied in four second-order streams in the Great Smokey Mountains National Park. The streams ranged in pH from 4.5 to 6.4 at baseflow. Mass loss of leaves incubated in mesh bags placed in pools in each stream was measured periodically over 15 wk beginning in late August. Measurements were also made of C, N, P, and Al in leaves, microbial biomass (adenosine triphosphate (ATP)) and respiration rate and bacterial production (thymidine uptake) associated with leaves, and the number and biomass of macroinvertebrates in leaf bags. Rates of leaf mass loss were significantly lower in streams with pH less than or equal to 5.7 compared with a stream with a pH of 6.4. Although rate of leaf mass loss among the streams varied directly with pH, differences between streams with pH values between 4.5 and 5.7 were not significant. Microbial ATP and respiration rates and bacterial production rates followed the same pattern as leaf mass loss rate, i.e., low for more acidic streams and highest in the stream with the highest pH. Accumulation of aluminum by the leaf-microbe complex was also greatest in the most acidic streams. The number and biomass of macroinvertebrates shredders found in leaf bags was lowest at the highest pH site and therefore cannot account for the higher rate of lead mass loss found at this site. The results suggest that the lower rate of leaf decomposition in the more acidic streams is due largely to low rates of microbial activity. (Author's abstract)

ACIDIFICATION IN NORWAY - LOSS OF FISH POPULATIONS AND THE 1000 LAKE SURVEY 1986.
Norsk Inst. for Vannforskning, Oslo.
B. O. Rosseland, and A. Henriksen.
Science of the Total Environment STENDL, Vol. 96, No. 1/2, p 45-56, July 1990. 8 fig, 29 ref.

Descriptors: *Acid rain effects, *Fish populations, *Fishkill, *Lakes, *Norway, *Water pollution effects, Acidic water, Aluminum, Chemistry of precipitation, Deposition, Lake restoration, Nitrates, Sulfur compounds, Surveys, Water pollution.

Several regional surveys have demonstrated that lakes and watersheds in Norway are affected by acid precipitation. In autumn of 1986, the Norwegian Institute for Water Research (NIVA) conducted the 1000-Lake Survey on behalf of the Norwegian State Pollution Control Authority (SFT). The greatest loss of freshwater fish populations was found in Telemark, East Agder, West Agder, and Rogaland counties. This damage correlated well with pH and the concentrations of calcium and labile aluminum in the lakes. The number of barren lakes in Sorlandet and southern Vestlandet has doubled from 1971 to 1975. The chemical changes were characterized by a decrease in calcium and sulfate and an increase in aluminum and nitrate. There was little change in pH. The total land area affected by acidification damage increased from 33000 sq km in 1974 to 1979 to 36000 sq km in 1986. In 1986, over 18000 sq km were totally damaged compared with 13000 sq km in 1974 to 1979. This reflects an increase of nearly 40%. The greatest increase was registered in eastern Norway. Data from the 1000-Lake Survey indicated that 52% of the lakes in southern Norway were endangered. A 30% reduction in loadings of sulfur compounds would lead to the restoration of 28% of these lakes. A further reduction of 50% would ensure viable conditions for fish in 49% of the lakes, given a constant nitrate level in the lakes. The data provides hope for improving the environmental conditions of Norway's lakes. (Author's abstract)

EFFECTS OF TRIBUTYLTIN WITHIN A THALASSIA SEAGRASS ECOSYSTEM.
Cornell Univ., Ithaca, NY. Ecosystems Research Center.
J. R. Kelly, S. N. Levine, L. A. Buttel, K. A. Carr, and D. T. Rudnick.
Estuaries ESTUDO, Vol. 13, No. 3, p 301-310, September 1990. 1 fig, 6 tab, 18 ref. EPA Cooperative Agreement Nos. CR811649, CR812685, CR812685-02, and CR812685-03.

Descriptors: *Antifoulants, *Sea grasses, *Tributyltin, *Water pollution effects, Bioassay, Biological studies, Biomass, Carbon radioisotopes, Chlorophyll, Detritus, Mortality, Tributyltin chloride.

Flow-through seagrass core microcosms were used to examine responses of species and processes to a logarithmic gradient of dosing with 14-C labeled tributyltin-chloride (TBT-CL). Experiments involved delivery of TBT-CL to the water column of replicate cores of a treatment (n = 16) once per week; one-half of the cores were sacrificed after three weeks of dosing, the others were dosed for 3 weeks. Initial water column concentrations for the three treatments averaged 0.205, 2.23, and 22.2 micrograms/L, expressed as TBT+ cation, but these concentrations dropped rapidly. Retained 14-C tracer, an estimate of total organotin species, was distributed to sediments, plants and other biological tissues, all of whose tracer concentration increased with time. Measures to indicate responses of both autotrophic and heterotrophic organisms were made; in general, treatment effects were demonstrable statistically only at the highest dose level. Accumulation of chlorophyll and biomass on glass slides was highest when suspended for the entire experiment in the water of the hig

st treatments; this unexpected result was perhaps n indirect effect related to reduced grazing activi- y in the microcosms. The highest dose of TBT- CL resulted in a virtual population mortality of a ew macrobenthic species and decreased loss of lant material in litter bags, both demonstrated ithin the first 3 weeks of dosing. Reduced litter oss was coincident with mortality of an amphipod Cymadusa compta) capable of shredding plant aterial, and a causal relation between the two fects is plausible. Thus, if concentrated to similar vels in a Thalassia bed, TBT+ may have direct ecies-level effects and process-level effects, po- ntially causing ecosystem changes via disruption a species-process linkage influential in seagrass trital food web dynamics. the presence of the first recorded red tide (Pty- odiscus brevis) outbreak in North Carolina tumn 1987) recruitment of bay scallops (Argo- ten irradians concentricus) in the state's most ductive scallop beds was a virtual failure. Re- itment averaged across all of Bogue Sound and k Sound was only 2% of the mean of three vious red tide-free (control) years. Only from tral Core Sound northward, where the red tide urred later and not as intensively, was bay lop recruitment normal (93% of control years). rtality of adult scallops from early December 7 to late January 1988, while red tide was at m concentrations but fishing was prohibited, 21%. No comparable natural mortality data t for control years because intense fishing mor- y in this period is confounded with natural tality. Data on abundance of articulated pairs mpty shells strongly suggest that the red tide ed mortality of both adult and newly recruited scallops. Bay scallop recruitment in autumn again failed to restock the traditionally pro- ive scallop beds in western Bogue Sound and ack Sound, perhaps because the only concen- ons of spawners surviving the red tide in cen- Core Sound and further north, were too far nt for successful transport of bay scallop e in sufficient abundance to these traditional This potential explanation implies a continu- mpact of the red tide on North Carolina's bay op fishery until spawning populations increase ack Sound and western Bogue Sound. Descriptors: *Benthic fauna, *Eutrophication, *North Sea, *Population dynamics, *Water pollution effects, *Water quality trends, Biomass, Food habits, German Bight, Population density, Species composition.

Comparisons of benthic macrofauna biomass data from early and recent investigations indicate overall increases. These findings are supported by long-term density trends in macrozoobenthos populations from different areas of the German Bight. Examples are given which show that deep-dwelling and long-lived species derive less benefit from changing conditions than animals which (1) live near the sediment surface, (2) have an adaptive feeding behavior, and (3) grow and reproduce quickly. Thus, the observed changes are reflected in the dominance structure of the benthic fauna. These changes are interpreted as being influenced and driven by increased eutrophication. (Author's abstract)

The effect of low pH on egg shells (chorion) of rainbow trout, Oncorhynchus mykiss Walbaum (formerly Salmo gairdneri), and brown trout, Salmo trutta, were studied in stream water and dechlorinated tap water. Eggs of rainbow trout and brown trout were exposed to the poorly buffered creek, Hochfallbach in the Bavarian Forest. The average pH during low pH exposure was 5.5, with a minimum pH of 4.9 for several days. Green eggs were exposed for about 2 months and eyed eggs were exposed for about 1 month. In the laboratory, both rainbow and brown trout eggs were incubated as controls in poorly buffered, aerated and dechlorinated tap water at pH 7.3-7.6, or in tap waters artificially acidified with sulfuric acid to a pH 4.0-4.5 or 5.6-6.0. Results of chorion morphological studies showed that the plugs of the outer layer of the chorion, which block the channels of the underlying layer, developed distinctive vacuolization at low pH exposure in both stream and laboratory tests. This may lead to loss of chorional semi-permeability. Chorions were incompletely degraded at low pH inducing hatching problems. Partially hatched alevins showed only a small local zone of dissolution of the chorion around the head of the embryo preventing the larvae from being freed for hatching. Results were similar in both rainbow and brown trout eggs. (Geiger-PTT)

EFFECT OF SHORT-TERM EXPOSURE TO PENTACHLOROPHENOL AND OSMOTIC STRESS ON THE FREE AMINO ACID POOL OF THE FRESHWATER AMPHIPOD GAMMARUS PSEUDOLIMNAEUS BOUSFIELD.
Michigan State Univ., East Lansing. Pesticide Research Center.
R. L. Graney, and J. P. Giesy.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 16, No. 2, p 167-176, March 1987. 1 fig, 4 tab, 34 ref. NOAA Grant NA82RAH00002-ORD-32049.

Descriptors: *Amino acids, *Gammarus, *Osmotic pressure, *Pentachlorophenol, *Pesticide toxicity, *Toxicity, *Water pollution effects, Amphipods, Biochemical effects, Bioindicators, Phenolic pesticides, Salt stress, Sublethal effects.

The effects of acute stressors on the concentration of free amino acids (FAA) in the freshwater amphipod Gammarus pseudolimnaeus were investigated. Forth-eight hours of exposure to acutely toxic concentrations of pentachlorophenol (0.86, 1.16, 1.51, 1.80, and 2.24 mg/L) resulted in a significant decrease in the total FAA pool at the greater concentrations and a significant change in the FAA profile at the lesser concentration. Hyperosmotic conditions did not alter the FAA concentrations while hypoosmotic conditions caused a significant decrease in the total FAA pool. Pentachlorophenol exposure did not impair the ability of amphipods to resist hypoosmotic conditions; however, osmotic stress did influence the organisms ability to recover from toxicant exposure, as measured by changes in the concentration of FAA. The observed alterations in the concentration of total FAA in stressed amphipods is probably related to a disruption in the osmoregulatory ability of the organism. Changes in the FAA pool has potential as an in-situ biochemical indicator of toxicant-induced stress in freshwater invertebrates. (Author's abstract)

The acute toxicities and hematological effects of menadione (2-methyl-1,4-naphthoquinone) and dichlone (2,3-dichloro-1,4-naphthoquinone) were examined in yearling channel catfish (Ictalurus punctatus). These compounds served as models for quinones, which comprise a diverse group of com-

LIBRARY U. OF I. MARINE BIOLOGY

pounds that enter aquatic systems from numerous sources. The 96-hour LC50s measured were 720 micrograms/L and 42 micrograms/L for menadione and dichlone, respectively. In subsequent experiments, fish were exposed for 21 days to concentrations of 0, 0.25, 0.50, and 0.75 times the LC50 value of each compound. For both compounds, generally dose-dependent increases in methemoglobin concentrations and dose-dependent reductions in hemoglobin concentrations and hematocrit ratios were observed. These results are consistent with the hypothesis that these compounds are toxic in part due to their ability to undergo redox cycling and thereby generate reactive oxygen species. However, other modes of action, such as direct enzyme inhibition, may also be important. (Author's abstract)

TOXICITY OF FIVE SHALE OILS TO FISH AND AQUATIC INVERTEBRATES.
National Fisheries Contaminant Research Center, Columbia, MO.
D. F. Woodward, E. E. Little, and L. M. Smith.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 16, No. 2, p 239-246, March 1987. 4 tab, 26 ref.

Descriptors: *Bioassay, *Fish, *Invertebrates, *Oil pollution, *Oil shale, *Toxicity, *Toxicology, *Water pollution effects, Food chains, Hazard assessment, Median tolerance limit, Minnow, Mortality, Oil characterization, Oil spills, Squawfish, Sublethal effects, Trout.

The chemical composition and toxicity of three shale crude oils (Tosco, Paraho, and Geokinetics), a hydrotreated oil (Paraho HDT), and a refined shale oil (Paraho JP-4) were assessed to determine the potential hazards to native fish species and food chain organisms from accidental spills of such materials. Colorado squawfish (Ptychocheilus lucius), fathead minnow (Pimephales promelas), cutthroat trout (Salmo clarki), and colonies of aquatic invertebrates were exposed to water-soluble fractions of the shale oils for 96 hours to determine concentrations lethal to 50% of the exposed organisms (LC50). The behavior of surviving fish was also measured to determine sublethal influences of exposure. The composition of the five water-soluble fractions was similar to that of the crude and refined shale oils from which they were made. Hydrotreated and refined oils contained fewer aromatic compounds than the crude shale oils. Cutthroat trout, a species endemic to oil shale regions, was less tolerant of shale oil exposure than the other species tested; the LC50 concentrations were 1.8 mg/L for Geokinetics, 2.1 mg/L for Tosco, and 1.3 mg/L for Paraho. Exposure to concentrations of one half to one-eighth those causing mortality reduced the swimming capacity of squawfish and significantly impaired their ability to capture prey. The number of organisms colonizing plate samplers declined with increasing oil concentration. The genera Baetis and Isoperla were most sensitive to shale oil exposure; significant mortality occurred at the lowest concentration (0.5 to 0.7 mg/L) tested for each shale oil. (Author's abstract)

MUTAGENIC ACTIVITY OF SURFACE WATERS ADJACENT TO A NUCLEAR FUEL PROCESSING FACILITY.
Georgia Univ., Athens. Dept. of Food Science and Technology.
O. C. Pancorbo, P. J. Lein, and R. D. Blevins.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 16, No. 5, p 531-537, September 1987. 2 tab, 4 fig, 30 ref.

Descriptors: *Ames test, *Bioassay, *Mutagenicity, *Nuclear fuel, *Radioactive wastes, *Toxicology, *Water pollution effects, Industrial wastes, Mutagens, Path of pollutants, Phosphates, Pollutant identification, Radioisotopes, Spatial distribution, Stream pollution, Wastewater pollution.

Surface waters adjacent to a nuclear fuel processing facility (Nuclear Fuel Services, Inc, Erwin, TN) were extracted, using XAD-resin adsorption followed by solvent elution, and the extracts were assayed for mutagenic potential by the Ames Salmonella-mammalian microsome test. Dose-related mutagenic responses with TA102 (+S9) were produced with the extracts of water samples obtained from a creek receiving wastewater from the processing facility (specific mutagenic activities of 7,250 to 8250 net revertants per liter equivalent of water). The creek water extracts were not mutagenic with TA102 in the absence of S9, or with any other tester strain, (i.e., TA97, TA98, TA100, and TA1535) in the presence or absence of S9. Surface water samples downstream and upstream of Martin creek were not mutagenic, apparently indicating the lack of persistence of the observed mutagenicity. The major constituent in the mutagenic creek water extracts was identified as tributyl phosphate (TBP) by gas chromatography-mass spectrometry. However, TBP was not mutagenic with TA102 (+S9) at doses ranging from 196 micrograms/plate to 9.8 nanograms/plate. Because tester strain TA102 detects oxidative mutagenesis due to x-rays and ultraviolet radiation, it is possible that the observed mutagenicity of creek water extracts was due to radionuclides complexed to TBP. (Author's abstract)

EFFECT OF HEAVY METALS ON BAY SCALLOPS, SURF CLAMS, AND BLUE MUSSELS IN ACUTE AND LONG-TERM EXPOSURES.
National Marine Fisheries Service, Milford, CT. Milford Lab.
D. A. Nelson, J. E. Miller, and A. Calabrese.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 17, No. 5, p 595-600, September 1988. 3 fig, 3 tab, 18 ref.

Descriptors: *Chronic toxicity, *Clams, *Heavy metals, *Mytilus, *Scallops, *Toxicity, Bioassay, Copper, Juvenile growth stage, Lead, Median tolerance limit, Mortality, Mussels, Selenium, Water pollution effects, Zinc.

Juvenile Argopecten irradians and Spisula solidissima were exposed to copper (Cu), lead (Pb), selenium (Se) or zinc (Zn) in a 96-hour static bioassay. The order of toxicity for both bivalve species was the same: Cu > Se > Z, > Pb. With the exception of lead, A. irradians were more sensitive than S. solidissima to the metals tested. Juvenile Mytilus edulis were exposed in 96-hour static bioassays to cadmium (Cd), Cu, mercury (Hg), or silver (Ag). The order of toxicity was Cu = Hg = Ag > Cd. M. edulis was as sensitive to Cd as A. irradians. In a 126-day exposure, 45 young-of-the-year A. irradians or S. solidissima, or 45 adult M. edulis were exposed to Cu, using a proportional diluter apparatus. Copper was added to test tanks at concentrations of 0.002, 0.010, or 0.020 mg/L, while control tanks received untreated seawater. Of the three species exposed to the three concentrations of Cu, young-of-the-year S. solidissima were the most sensitive, followed by young-of-the-year A. irradians. Least sensitive was the adult M. edulis. (Author's abstract)

RISK ASSESSMENT OF DRINKING WATER IN A RESERVOIR CONTAMINATED BY PAHS ORIGINATED FROM ROAD TRAFFIC.
Ehime Prefecture Inst. of Public Health, Matsuyama (Japan).
T. Ishimaru, H. Inouye, and T. Morioka.
The Science of the Total Environment STENDL, Vol. 93, p 125-130, April 1990. 3 fig, 5 tab, 7 ref.

Descriptors: *Air pollution, *Carcinogens, *Drinking water, *Highway effects, *Polycyclic aromatic hydrocarbons, *Reservoirs, *Risks, *Water pollution sources, Aromatic compounds, Assessments, Chemical analysis, Surface runoff, Water analysis.

The loads of polycyclic aromatic hydrocarbons (PAHs) originating from road traffic were measured, and units of per vehicle per meter were estimated as follows: 0.07 ng per vehicle per meter for benzo-a-pyrene, 0.83 ng per vehicle per meter for dibenzanthracene, and 5.77 ng per vehicle per meter for total PAHs. This unit was applied to the risk estimation of drinking water from a reservoir where there are plans to construct a new highway in the near future. Currently, the concentration of PAHs in the reservoir water is estimated to be 3.3 to 101 ng/L for individual PAHs. Assuming standard oral exposure to PAHs in raw water for the drinking water supply, the estimated lifetime risk of carcinogenesis was calculated to be < 1 in 10 million, which is not considered significant. SLURRY-EXPLOSIVE PLANT WASTE WATERS: ENVIRONMENTAL IMPACT AND TREATMENT.
Ravishankar Univ., Raipur (India). Dept. of Chemistry.
J. K. Moitra, and G. S. Pandey.
The Science of the Total Environment STENDL, Vol. 95, p 191-199, June 1990. 1 fig, 3 tab, 13 ref.

Descriptors: *Biological wastewater treatment, *Environmental impact, *Explosives wastes, *Groundwater pollution, *Industrial wastewater, *Slurries, *Wastewater treatment, *Water pollution effects, Acid-charred waste, Ammonium, Effluents, Nitrates, Sludge, Sludge utilization, Wastewater, Water hyacinth, Water quality.

Slurry-explosives are produced by mixing an oxidizing solution of nitrates of ammonium and calcium, thiourea, ethylene glycol, guargum and water with a solid fuel mix consisting of aluminium powder, starch, tamarind kernelpowder, gilsonite and sulfur, in a hydraulically operated mixer, to give a slurry. The major portion of wastewaters produced during the continuous washing process of the cartridges that hold the slurry. The impact of the discharged wastewater on groundwater quality is noticeable up to a distance of 10 km from the coffer dam. The presence of ammonium and nitrate ions was found up to distance of 5 and 6.5 km, respectively. However, from pH, total dissolved solids and calcium hardness data, the impact of the wastewater can be inferred up to a distance of 10 km. Acid-charred waste from an oxalic acid plant, domestic sewage sludge, and the water hyacinth were used as treatment materials for these wastes. Acid-charred waste was found to be 60 percent effective, and domestic sewage sludge was found to be 95 percent effective in the removal of the nitrogenous content of the wastewaters. The water hyacinth (Eichhornia crassipes) removes nitrate and ammonium efficiently when these ions are present below toxicity limits. If cultivated in the vicinity of a slurry-explosive manufacturing plant, the water hyacinth could play a role in the control of contamination of groundwater by nitrogenous compounds in the discharged wastewaters. Descriptors: *Acid rain effects, *Aquatic animals, *Ecosystems, *Lake acidification, *Limnology, *Path of pollutants, *Scandinavia, Decomposition, Food chains, Heavy metals, Invertebrates, Predation, Survival, Toxicity, Transparency.

The problem of acidification of freshwaters affected by long distance transported pollutants affects many of the lakes in Scandinavia. Besides direct

ffects, such as reduced reproduction or survival
f fish and invertebrates due to low pH or expo-
ure to toxic metals, many indirect effects are also
nportant factors. These indirect effects include
cological mechanisms such as a shift of top preda-
ors from fish to invertebrates and a reduced de-
omposition rate due to decreased abundance of
etritivores; as well as feedback effects on the
biotic environment, such as reduced productivity
nd turnover rate of nutrients and an increase in
ater transparency. Impaired reproduction among
asserine birds has been related to exposure of
uminum through the intake of insects emerging
om acidified waters. Adverse effects on duck
opulations due to reduced abundance or quality
food organisms has been emphasized more in
orth America than in Scandinavia, but combined
fects of acidity and predation pressure from acid-
lerant fish contribute to low abundances of wa-
rfowl. (Brunone-PTT)

CUTE TOXICITY OF SELECTED HERBI-
DES AND SURFACTANTS TO LARVAE OF
HE MIDGE CHIRONOMUS RIPARIUS.
ational Fisheries Contaminant Research Center,
nkton, SD. Field Research Station.
J. Buhl, and N. L. Faerber.
chives of Environmental Contamination and
xicology AECTCV, Vol. 18, No. 4, p 530-536,
y/August 1989. 4 tab, 24 ref.

scriptors: *Aquatic insects, *Bioassay, *Herbi-
es, *Midges, *Surfactants, *Toxicity, *Water
lution effects, Alachlor, Bromoxynil, Butylate,
ect larvae, Lethal limit, Metribuzin, Storms,
allate.

e acute toxicities of eight commercial herbicides
two surfactants to early fourth instar larvae of
midge Chironomus riparius were determined
er static conditions. The formulated herbicides
ed were Eradicane (EPTC), Fargo (triallate),
so (alachlor), ME4 Brominal (bromoxynil),
nrod (propachlor), Rodeo (glyphosate), Sencor
tribuzin), and Sutan (+) (butylate); the two
actants were Activator N.F. and Ortho X-77.
ddition, technical grade alachlor, metribuzin,
achlor, and triallate were tested for compari-
with the formulated herbicides. The relative
city of the commercial formulations, based on
ent active ingredient, varied considerably. The
0 values ranged from 1.23 mg/L for Fargo to
) mg/L for Rodeo. Fargo, ME4 Brominal, and
rod were moderately toxic to midge larvae;
o, Sutan (+), and Eradicane were slightly
; and Sencor and Rodeo were practically non-
. The 48-hour EC50 values of the two surfac-
were nearly identical and were considered
erately toxic to midges. For two of the herbi-
, in which the technical grade material was
d, the inert ingredients in the formulations had
nificant effect on the toxicity of the active
dients. Fargo was twice as toxic as technical
e triallate, whereas Sencor was considerably
oxic than technical grade metribuzin. A com-
on of the slope function values indicated that
oxic action of all compounds occurred within
atively narrow range. In general. the relative
of toxicity to Chironomus riparius was simi-
o those for other freshwater invertebrates.
mum concentrations of each herbicide in bulk

Descriptors: *Aquatic plants, *Cleanup operations, *Hydrocarbons, *Idaho, *Macroinvertebrates, *Oil spills, *Periphyton, Chlorophyll a, Mixing, Sediment chemistry, Species diversity.

Following a spill of more than 94.4 cubic m of unleaded gasoline into Wolf Lodge Creek in northern Idaho, impacted areas were mechanically agitated to release substrate-trapped hydrocarbons by dragging a bulldozer blade with a tightly wound chainlink fence attached to it backward over the substrate. Portions of two riffles were left unagitated to determine if differential recovery of benthic macroinvertebrates and periphyton in cleaned versus uncleaned areas of the stream would occur. Chlorophyll a concentrations and densities of most macroinvertebrates were significantly lower ($P < or = 0.05$) in raked areas 12 days after stream cleaning. However, macroinvertebrate and periphyton community compositions were very similar 1 month after stream cleaning and for the remainder of the study. In spite of similar recovery times of macroinvertebrates and periphyton in raked and nonraked areas, the cleaning process is viewed as beneficial because it minimized possible chronic effects on the biota without causing substantial additional impact. EFFECTS OF CADMIUM ON MUREX TRUNCULUS FROM THE ADRIATIC SEA: II. OXYGEN CONSUMPTION AND ACCLIMATION EFFECTS.
Innsbruck Univ. (Austria). Inst. fuer Zoologie.
G. J. Dalla Via, R. Dallinger, and E. Carpene.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 562-567, July/August 1989. 4 fig, 1 tab, 21 ref.

Descriptors: *Adriatic Sea, *Bioaccumulation, *Bioassay, *Cadmium, *Heavy metals, *Mollusks, *Oxygen requirements, *Toxicity, *Toxicology, *Water pollution effects, Acclimatization, Biomass, Snails.

Marine snails (Murex trunculus) from the Adriatic Sea were exposed to cadmium in the laboratory under chronic (0.05 mg/L) and acute (5 mg/L) conditions. More than 5 mg/L cadmium were required to lethally damage Murex trunculus during an exposure of 96 hours. Compared with untreated animals, chronic exposure of Murex trunculus to 0.05 mg/L cadmium results in an elevated rate of oxygen consumption. The difference between the two groups of snails increases with time. After one month, a 10% greater loss in biomass in treated animals than in controls was observed, reflecting the higher energy expenditure during exposure to 0.05 mg/L cadmium. An acute cadmium shock of 5 mg/L caused depression of oxygen consumption both in the control and in long term pre-exposed snails to 0.05 mg/L. If pre-exposure to a low concentration of cadmium lasted for a short time only (18 hours) a subsequent acute cadmium shock did not lead to a depression of the rate of oxygen consumption. EFFECT OF WATERBORNE AND DIETARY CADMIUM ON PLASMA IONS OF THE TELEOST OREOCHROMIS MOSSAMBICUS IN RELATION TO WATER CALCIUM LEVELS.
Dar es Salaam Univ. (Tanzania). Dept. of Zoology and Marine Biology.
H. B. Pratap, H. Fu, R. A. C. Lock, and S. E. W. Bonga.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 568-575, July/August 1989. 2 tab, 59 ref.

Descriptors: *Cadmium, *Calcium, *Fish physiology, *Heavy metals, *Toxicity, *Toxicology, *Water chemistry, *Water pollution effects, Bioaccumulation, Cichlid, Metabolism, Tilapia.

The effects of cadmium administered via ambient water or food on plasma ions of the African freshwater cichlid Oreochromis mossambicus were studied for 2, 4, 14 and 35 days, in low calcium (0.2 mM) and high calcium (0.8 mM) water. In low calcium water, an environmentally relevant concentration of 10 microg/L water-borne cadmium induced a significant and dramatic hypocalcemia on days 2 and 4. Recovery of plasma calcium was observed on days 14 and 35. Hypermagnesemia was observed on day 2, but normal levels were already found on day 4. In high calcium water adapted fish, the extent of hypocalcemia and hypermagnesemia was less pronounced than in fish from low calcium water. Water-borne cadmium caused no significant changes in plasma phosphate, sodium, potassium or osmolality. On days 2 and 4, dietary cadmium (averaging 10 microg cadmium/fish/day) caused hypermagnesemia and hypocalcemia in low calcium water adapted fish. Recovery was observed on days 4 and 14, respectively. In fish from high calcium water, dietary cadmium caused a significant reduction in plasma calcium on day 4 only; plasma magnesium was unaffected. Hyperphosphatemia was apparent on day 14, irrespective of the water calcium concentration. No changes in plasma sodium, potassium, or osmolality were found. The results show that sublethal concentrations of cadmium, administered via the water as well as via the food, affect calcium and magnesium metabolism in tilapia. High water calcium ameliorates the effects of both water and dietary cadmium on plasma calcium and magnesium levels. (Author's abstract)

UPTAKE AND ELIMINATION OF WATERBORNE CADMIUM BY THE FISH NOEMACHEILUS BARBATULUS L. (STONE LOACH).
Institute of Terrestrial Ecology, Huntingdon (England). Monks Wood Experimental Station.
P. E. T. Douben.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 18, No. 4, p 576-586, July/August 1989. 4 fig, 7 tab, 49 ref.

Descriptors: *Bioaccumulation, *Bioassay, *Cadmium, *Fish physiology, *Heavy metals, *Metabolism, *Toxicity, *Water pollution effects, Feeding, Growth rates, Stone loach, Temperature effects.

Fish, Nemacheilus barbatulus L. (stone loach), were exposed to cadmium in water to study rates of uptake and loss in three experiments: one during which they were exposed for up to 4 days to 1.0 mg/L cadmium and subsequently kept in clean water for up to another 8 days at 8 C, 16 C, and 18 C; a second one during which fish were exposed to a range of cadmium concentrations in water (0.08 to 0.93 mg/L); and a third one during which they were starved or fed with Tubifex while some were exposed to 0.067 mg/L cadmium. All levels were well below those that are acutely toxic. Results showed that fed fish did not change weight while all starved fish lost weight, at a higher rate for exposed fish than for control fish. Size of the fish affected rates of uptake and loss of cadmium. These rates increased with temperature. Bioconcentration factors decreased with size of fish, increased with temperature up to about 16 C and decreased as the concentration of cadmium in water increased. Feeding appears to increase the rate of intake of cadmium from the water. Metabolic rate governed rates of uptake and loss. (Author's abstract)

Descriptors: *Bioassay, *Copper, *Diets, *Heavy metals, *Toxicity, *Toxicology, *Water pollution effects, *Waterfleas, Hardness.

The effects of diet, water hardness, and population source on acute toxicity, and diet and water hardness on chronic toxicity of copper to Ceriodaphnia dubia were investigated. A diet of three algae (Chlamydomonas rheinhardti, Ankistrodesmus falcatus, and Chlorella vulgaris, hereafter referred to as CAC) cultured in vitamin-enriched media was superior to synthetic diets consisting of yeast, Cerophyll, and trout chow (YCT). Neonates from mothers reared on CAC were 1.4 to 1.5 times more resistant to copper than those reared on YCT or yeast and Cerophyll. Forty-eight hour LC50s of copper to C. dubia increased from 35 to 79 microg/L at water hardness of 94 and 170 mg calcium carbonate/L. Three populations of Ceriodaphnia derived from three US Environmental Protection Agency laboratories showed no differential copper sensitivity. Chronic copper impairment was measured by neonate production in the 7-day life cycle test. Chronic values were 7.9 and 10.1 microg/L at water hardnesses of 94 and 170 mg/L respectively. A comparison of daily water renewal and renewal on days 3 and 5 only was made, showing that neonate production was significantly greater using day 3 and 5 renewals (Friedmann's Rank Sum Test, $p < 0.005$), even though copper concentrations were comparable between the two tests. Therefore, handling stress may have occurred using daily changes. It is recommended that future tests and US EPA guidelines should address deleting YCT and including multi-algal diets for culturing and chronic testing of Ceriodaphnia. (Author's abstract)

PHYSIOLOGICAL RESPONSES TO SEVERE ACID STRESS IN FOUR SPECIES OF FRESHWATER CLAMS (UNIONIDAE).
Helsinki Univ. (Finland). Dept. of Zoology.
K. Pynnonen.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 471-478, July/August 1990. 5 fig, 6 tab, 28 ref.

Descriptors: *Acid rain effects, *Acidic water, *Bioassay, *Mollusks, *Water pollution effects, Calcium, Chlorides, Clams, Finland, Hardness, Hydrogen ion concentration, Physiology, Potassium, Sodium.

Four species of freshwater clam, Anodonta anatina, A. cygnea, Unio pictorum, and U. tumidus were exposed for 2 weeks to acidified soft water (pH 4.0 to 4.5, calcium 4.6 mg/L) and for 4 weeks to acid in hard water conditions (calcium 18.5 mg/L). The exposures caused a decrease in sodium ions, potassium ions and chloride ions and a rapid increase of calcium ions in the hemolymph. The elevation of the hemolymph calcium ions was positively correlated with the decrease in the hemolymph pH in all species studied. Low ambient calcium ion level accelerated the pH decrease and calcium ion increase in the hemolymph. Sodium and chloride ion concentrations changed less rapidly in the soft conditions. Although there were minor changes in the mineral composition of the calcium concretions in the gills, the amount of calcium in the concretions did not change during the exposure. There was no correlation between the thickness of the shell and the ionic response, but all four species responded to low ambient pH in the same way. (Author's abstract)

MORPHOMETRIC AND X-RAY ENERGY DISPERSIVE APPROACH TO MONITORING PH-ALTERED CADMIUM TOXICITY IN ANABAENA FLOS-AQUAE.
Herbert H. Lehman Coll., Bronx, NY. Dept. of Biological Sciences.
L. C. Rai, T. E. Jensen, and J. W. Rachlin.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 479-487, July/August 1990. 6 fig, 7 tab, 36 ref. Minority Biomedical Research Grant No. 4-42433, Faculty Research Award Program Grant 6-67202.

Descriptors: *Acid rain effects, *Algae, *Cadmium, *Cyanophyta, *Heavy metals, *Hydrogen ion concentration, *Morphology, *Toxicity, *Trace elements, *Water pollution effects, Absorption, Bioassay, Monitoring.

Cyanobacteria are a group of procaryotic photosynthetic microbes with a genome plasticity that allows them to grow in some of the harshest environments. To date, there is no information on the combined effects of pH and cadmium toxicity on ultrastructural changes in algae; nor have the ultrastructural effects of pH alone been documented. Cadmium toxicity and uptake as influenced by different pH values were investigated in the freshwater cyanophyte Anabaena flos-aquae, using morphometric analysis, x-ray energy dispersive analysis and atomic absorption spectrophotometry. A general reduction in cell dimension, thylakoid surface area, number and volume of polyhedral bodies, polyphosphate bodies, cyanophycin granules, lipid bodies, membrane limited crystalline inclusions, volume and number of wall layers and mesosomes was observed. These reductions were more pronounced in both acidic and alkaline medium than at pH 7.2. At 0.12 microM cadmium, the uptake increased with alkaline pH values, and uptake was greater at pH 7.2 than at either acid or alkaline pHs. Lysis of cell wall at 1.18 microM cadmium showed the following decreasing trend: pH 4.0 > pH 5.5 > pH 10 > pH 9.0 > pH 7.2. A total loss of lipid bodies at 1.18 microM cadmium resulted at all pH values listed. These techniques could be successfully employed for bioassay studies of metal toxicity to algae. In particular, cell wall lysis and loss of lipids by algae are good indicators of pH effects and metal toxicity in the aquatic ecosystem. (Author's abstract)

TOXICITY AND BIOACCUMULATION OF SELENATE, SELENITE AND SELENO-L-METHIONINE IN THE CYANOBACTERIUM ANABAENA FLOS-AQUAE.
California Univ., Davis. Dept. of Land, Air and Water Resources.
P. Kiffney, and A. Knight.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 488-494, July/August 1990. 1 fig, 6 tab, 29 ref. DOI-USGS Project No. 140800001G and Univ. of California Salinity/Drainage Task Force Project No. 86-9.

Descriptors: *Bioaccumulation, *Cyanophyta, *Heavy metals, *Selenium, *Toxicity, *Water pollution effects, Amino acids, Bacterial physiology, Chlorophyll a, Food chains, Metabolism.

A laboratory investigation was conducted to study the toxicity and bioaccumulation of seleno-L-methionine, selenate and selenite in the cyanobacterium Anabaena flos-aquae. The first sublethal effects of seleno-L-methionine, selenite and selenate occurred at 0.1, 3.0 and 3.0 mg/L, respectively with a decrease in chlorophyll a concentration ($P < 0.0001$). Selenium bioconcentration factors were in the order of seleno-L-methionine, selenite, and selenate. Significant decreases in intracellular selenium concentration were observed at both the no effect and low level effect at each oxidation state tested in the given experiment ($P < 0.0001$). The preferential uptake of selenite and seleno-L-methionine was explained by the additional energy consuming metabolic steps necessary for the alga to reduce and incorporate selenate into sulfur amino acids. The mechanism by which algae regulate selenium to ameliorate toxicity is still not known. The poisoning of the upper trophic levels in selenium contaminated systems is due to the bioconcentration of selenium by primary producers and the subsequent biomagnification of the toxic organic forms of selenium up the aquatic food chain. Therefore, this cyanobacterium is a potentially dangerous food source in the aquatic food chain in selenium contaminated systems. (Brunone-PTT)

BIOACCUMULATION OF SELENIUM IN BIRDS AT KESTERSON RESERVOIR, CALIFORNIA.
Patuxent Wildlife Research Center, Davis, CA. Pacific Coast Field Station.
H. M. Ohlendorf, R. L. Hothem, C. M. Bunck, and K. C. Marois.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 495-507, July/August 1990. 3 fig, 8 tab, 45 ref, append

Descriptors: *Bioaccumulation, *Birds, *California, *Kesterson Reservoir, *Selenium, *Toxicity, *Water pollution effects, Depuration, Food chains, Heavy metals, Physiology, Tissues.

Selenium concentrations in tissues of birds collected during the 1984 to 1985 nesting seasons at Kesterton Reservoir (an area receiving high selenium irrigation drainage water) were determined. These concentrations were compared with those from birds from reference sites within California's Central Valley, and relate to foodchain selenium concentrations at the study sites. Within years selenium in livers of adult birds collected early and late in the nesting season changed significantly at both Kesterton and the primary reference site (Volta Wildlife Area). These changes were related to the length of time birds had been present at the study sites and the associated accumulation (at Kesterton) or depuration (at Volta) of selenium. All species showed significant location differences which were greatest in species that occurred at Kesterton throughout the year or fed more consistently within the reservoir. There were few species differences in selenium for birds at the reference sites (where food chain selenium levels were normal (<or = 2 microg/g dry weight)). At Kesterton (where bird foods generally contained >5 microg selenium/g), species patterns varied by year, probably because of varying periods of residence and other factors. Selenium concentrations in kidneys and livers of American coots (Fulica americana) were significantly correlated ($r = 0.9845$); selenium concentrations in breast muscle and livers of juvenile ducks (Anas spp.) also were correlated ($r = 0.8280$). Body weights of adult coots were negatively correlated with liver selenium concentration. Late-season resident breeding birds or pre-fledgling juvenile birds reared at a site usually provided the best indication of site-specific selenium bioaccumulation. (Author's abstract)

EXPRESSION OF RESULTS FROM GROWTH INHIBITION TOXICITY TESTS WITH ALGAE.
Vandkvalitetsinstitutet, Hoersholm (Denmark).
N. Nyholm.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 518-527, July/August 1990. 4 fig, 2 tab, 14 ref.

Descriptors: *Algal growth, *Bioassay, *Bioindicators, *Growth rates, *Toxicity, *Toxicology, Biomass, Dose-response relationships, Plant physiology.

Results from six growth inhibition toxicity tests with the freshwater green algae Selenastrum capricornutum and Scenedesmus subspicatus have been analyzed using both biomass measurements and estimates of the specific growth rate to quantify the toxic response. For exponentially growing cultures, biomass derived effective concentrations (EC's) decrease with time, but reach asymptotic values in the course of some days. The final (asymptotic) values are smaller than EC figures derived from growth rates, and the differences are greater, the smaller the slope of the dose response curve. EC50 values differed by up to a factor of 6. Standard test protocols for routine testing should prescribe the use of some appropriate measure of the specific growth rate, rather than the biomass as the response variable. (Author's abstract)

EFFECTS OF PARAQUAT ON MORTALITY AND CARDIORESPIRATORY FUNCTION OF CATFISH FRY PLECOSTOMUS COMMERSONI.
Universidad Nacional de Lujan (Argentina). Lab. of Ecotoxicology.
M. C. Tortorelli, D. A. Hernandez, G. Rey Vazquez, and S. Salibian.

Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 523-529, July/August 1990. 4 fig, 5 tab, 19 ref. CONICET (Resol. 0318-9780/86 and CIC-Bs.As (Resol. 7500-7587/86).

Descriptors: *Catfish, *Fish physiology, *Herbicides, *Paraquat, *Toxicity, *Toxicology, *Water pollution effects, Gills, Microscopy, Morphology, Mortality.

The effects of a paraquat commercial herbicide formulation on an early stage of the development of Plecostomus commersoni were evaluated. Mortality, opercular ventilation rate, cardiac contraction rate and body length were examined every twelve hours. The effects of the paraquat formulation on the morphology of the branchial epithelium were also examined by light microscopy. The assayed paraquat formulation significantly affected cardiac contraction and opercular ventilation. Ecotoxicologically, this could represent an important deleterious effect for early development of the catfish. Mortality data may not be sufficient for an appropriate evaluation of secondary environmental hazards associated with the application of paraquat formulation because the LC-50 values for Plecostomus commersoni fry were higher than the recommended individual application rate of paraquat for aquatic weed control (0.1 to 2.0 mg/L), and the estimated maximum acceptable toxicant concentration (MATC) resulted in a concentration similar to the application rate when calculated from acute toxicity. When the MATC was estimated from opercular ventilation or cardiac contraction rates, it was lower and fell within the recommended single application rates. (Author's abstract)

Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 558-564, July/August 1990. 4 fig, 3 tab, 25 ref.

Descriptors: *Amphipods, *Aroclors, *Bioaccumulation, *Tetrachlorobiphenyl, *Toxicity, *Toxicology, Aquatic fauna, Biomagnification, Food chains, Invertebrates, Mortality, Polychlorinated biphenyls.

The addition of 100 microg/L of Aroclor 1242 or 2,5,2',5'-tetrachlorobiphenyl (TeCB) during 10 week chronic toxicity tests with Hyalella azteca resulted in complete mortality. There were no effects on survival, growth or reproduction after addition of 30 microg/L. Toxic effects were observed at tissue levels of between 30 and 180 microg/g on a wet weight basis, and tissue levels appear to be a better indicator of toxicity than levels in water. No toxic effects were observed after addition of up to 2700 microg/L of the coplanar congener 3,4,3',4'-TeCB. H. azteca has the ability to avoid accumulating in excess of 140 microg/g 3,4,3',4'-TeCB. The amount taken up was proportional to the amount added in water up to 100 microg/L, but was constant at higher additions, possibly accounting for its relatively low toxicity. The low toxicity of the coplanar congener, as compared to the non-coplanar 2,5,2',5'-TeCB, is in direct contrast to the high toxicity of coplanar PCB congeners to mammals and may be associated with slower rates of aromatic hydrocarbon metabolism in amphipods. Polychlorinated biphenyl levels measured in amphipods from Lake Ontario are approximately 100-fold below levels associated with toxicity in H. azteca, but are above levels which, through biomagnification up the food chain, lead to salmonid residues in excess of 2 microg/g, a tolerance limit for human consumption. (Author's abstract)

COMPARATIVE TOXICOKINETICS OF 2,2'-DICHLOROBIPHENYLS AND 4,4'-DICHLOROBIPHENYLS IN THE POND SNAIL LYMNAEA STAGNALIS.
Vrije Univ., Amsterdam (Netherlands). Dept. of Pharmacochemistry.
M. Wilbrink, M. Treskes, T. A. De Vlieger, and N. P. E. Vermeulen.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 565-571, July/August 1990. 4 fig, 2 tab, 30 ref.

Descriptors: *Dichlorobiphenyls, *Mollusks, *Path of pollutants, *Polychlorinated biphenyls, *Snails, *Toxicity, *Toxicology, *Water pollution effects, Temporal distribution.

Pond snails (Lymnaea stagnalis (L.)) were treated with 2,2'-dichlorobiphenyl (DCB) or 4,4'-DCB, to examine the toxicokinetic profile of these compounds. Snails were treated orally with 210 microg 4,4'-DCB (impregnated on food) for 14 hours, or snails were injected with 50 microg of 2,2'-DCB or 4,4'-DCB in the foot. At different times after starting feeding or injection, tissues (albumen gland, digestive gland and digestive tube, central nervous system, remainder parts), hemolymph and feces were analyzed for unchanged 2,2'-DCB or 4,4'-DCB. The results showed that in the case of oral administration of 4,4'-DCB after 144 hr, 97.5% of the dose was excreted unchanged in the feces. During the first 48 hours, 4,4'-DCB was found in all tissues. Thereafter, an exponential elimination was found (The rate constant of elimination varied from 0.010 to 0.021 per hour, half life from 33 to 60 hours and the apparent clearance from 0.02 to 0.3 g/hr for the different tissues). After injection, the compounds were found in all the above mentioned tissues, especially in the digestive gland. There was a clear difference between snails injected with 2,2'-DCB and 4,4'-DCB. Firstly, the rate constant of elimination 2,2'-DCB was higher (0.028 per hr vs 4,4'-DCB: 0.001 per hr). Secondly, 2,2'-DCB was lethal; 63% of the animals died after 72 hours. (Author's abstract)

TOXICOLOGICAL EXAMINATION OF WHITEFISH (COREGONUS CLUPEAFORMIS) AND NORTHERN PIKE (ESOX LUCIUS) EXPOSED TO URANIUM MINE TAILINGS.
Environmental Protection Service, Regina (Saskatchewan).
D. T. Waite, S. R. Joshi, H. Sommerstad, G. Wobeser, and A. A. Gajadhar.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 578-582, July/August 1990. 1 fig, 3 tab, 10 ref.

Descriptors: *Bioaccumulation, *Canada, *Pike, *Radioactive wastes, *Toxicity, *Toxicology, *Uranium, *Water pollution effects, *Whitefish, Enzyme activity, Fecundity, Fish parasites, Histopathology, Lake Athabasca, Langley Bay, Mine tailings, Sediment chemistry.

Operation of the Gunnar uranium mine, in northern Saskatchewan, Canada, from 1955 to 1964, resulted in the deposition of radioactive tailings in Langley Bay, a small bay connected to Lake Athabasca. The sediments, water, macrophytes and fish of this area have been contaminated with uranium mine tailings. The parasite infestation, blood hematocrit, histopathology and condition factor of the Langley Bay whitefish and northern pike populations were compared with those from Lake Athabasca. Parasite infestations of the control area were very similar to those of Langley Bay. Differences in parasite fauna probably reflect habitat differences rather than debilitation from exposure to radionuclides. The highest concentrations of radionuclides were found in the gut contents and bone of whitefish from Langley Bay. Kidney tissue contained higher radionuclide concentrations than other soft tissues. The concentrations of radionuclides and other heavy metals in the tissues and environment of Langley Bay whitefish had not caused overt histopathological changes in these fish. No significant differences could be found, in any of the physiological parameters measured, between the contaminated and control populations. Many other aspects of the health of these fish populations have not been studied including: genetic make-up; fecundity; blood plasma chemistry; and, enzyme function. The lack of information in the literature on the uptake rates and mechanisms for natural radionuclides has hampered toxicological studies of these populations. (Brunone-PTT)

SUBLETHAL AND ACUTE TOXICITY OF THE ETHYLENE GLYCOL BUTYL ETHER ESTER FORMULATION OF TRICLOPYR TO JUVENILE COHO SALMON (ONCORHYNCHUS KISUTCH).
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
J. A. Johansen, and G. H. Geen.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 610-616, July/August 1990. 3 fig, 4 tab, 20 ref.

Descriptors: *Fish physiology, *Herbicides, *Salmon, *Toxicity, *Triclopyr, *Water pollution effects, Dose-response relationships, Fish behavior, Fishkill, Oxygen requirements, Uptake.

The toxicity of Garlon 4, the ethylene glycol butyl ether ester formulation of the herbicide triclopyr, to juvenile coho salmon (Oncorhynchus kisutch) was investigated at several lethal and sublethal concentrations. Fish behavior, random activity, and oxygen uptake were monitored. Coho salmon exhibited three distinct responses related to concentration and duration of exposure: (1) at concentrations greater than 0.56 mg/L fish were initially lethargic, then regressed to a highly distressed condition characterized by elevated oxygen uptake and finally death, (2) at 0.32 to 0.43 mg/L fish were lethargic throughout the exposure period with reduced oxygen uptake, and (3) at concentrations <= 0.10 mg/L fish were hypersensitive to stimuli, exhibiting elevated activity and oxygen uptake levels during photoperiod transitions. Whole body residue analysis showed that uptake of the ester and subsequent hydrolysis to the acid form in the fish was rapid, with significant accumulation of the acid in the tissues. This result suggests that some threshold tissue concentrations were associated with the observed results. For juvenile coho salmon the 96 hour LC40 of Garlon 4 was 0.84 mg/L. (Author's abstract)

EFFECTS OF SHORT-TERM PULSES OF ATRAZINE ON ATTACHED ALGAL COMMUNITIES IN A SMALL STREAM.
Texas Christian Univ., Fort Worth. Dept. of Biology.
T. A. Jurgensen, and K. D. Hoagland.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 617-623, July/August 1990. 4 fig, 6 tab, 46 ref.

Descriptors: *Algae, *Atrazine, *Ecosystems, *Herbicides, *Stream biota, *Toxicology, *Water pollution effects, Algal toxicity, Biomass, Nebraska, Plant physiology, Sedimentation.

The impact of short-term atrazine exposures on attached algal community composition and standing crop was investigated during the summer in a small, spring-fed stream in western Nebraska. Replicate trays of clay tiles were anchored to the stream bed, allowed to colonize for two weeks, then enclosed in situ with plexiglass boxes and exposed to a pulse of atrazine at 0, 2, 30, or 100 microg/L for 24 hours. A second 24-hour atrazine pulse was applied two weeks later. Atrazine did not have a significant effect on cell densities of the dominant algae or the ash-free dry weight biomass of the periphyton community. The absence of observed treatment effects was likely due to the low but realistic levels of atrazine used and the tran-

LIBRARY U. S. D. I. GEOLOGICAL SURVEY

sient nature of the application. Sediment deposition had a much greater influence on the attached algal community than short term pulses of the herbicide. (Author's abstract)

COMPARATIVE TOXICITIES OF SELECTED INDUSTRIAL CHEMICALS TO MICROORGANISMS AND OTHER AQUATIC ORGANISMS.
Wisconsin Univ.-Superior. Center for Lake Superior Environmental Studies.
D. D. Vaishnav, and E. T. Korthals.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 4, p 624-628, July/August 1990. 2 fig, 2 tab, 23 ref. EPA Cooperative Agreement No. CR809234.

Descriptors: *Aquatic life, *Copepods, *Fish, *Microorganisms, *Toxicity, *Toxicology, *Water pollution effects, *Waterfleas, Alcohols, Barnacles, Bioassay, Biodegradation, Growth rates, Ketones, Naphthalenes, Phenols, Statistical analysis.

Microorganisms are particularly suitable for use in rapidly screening chemical toxicity because they are relatively easy to handle, have rapid growth rates, provide reproducible results, and are inexpensive to grow and maintain. Biodegradation rates of 25 narcotic industrial chemicals were determined nanometrically using resting cells prepared from preacclimated mixed cultures of microorganisms. These chemicals included straight-chain and cyclic alcohols and ketones as well as naphthalene and phenol. Chemical concentrations that would reduce maximum rates by 50% (BIC50) were estimated from rate inhibition data. Subsequently, the BIC50 and acute toxicities of chemicals to daphnids, barnacle larvae, copepods, and fish (bleak, fathead minnow and golden orfe) were correlated. The r-squared and F-statistics for all six linear correlations were significant (alpha = 0.001). This result suggests, for chemicals having a non-specific mode of toxic action, the biodegradation inhibition test may be used to estimate concentrations which would be toxic to higher aquatic organisms. A comparisons of toxicity data showed microorganisms were less sensitive to test chemicals than the other species. Chemical concentrations causing 50% inhibition of the maximum rates of microbial degradation to the six aquatic organisms correlated well for selected narcotic industrial chemicals. The test may also be adapted for evaluating colored or turbid samples, and the bioavailable chemicals in sediment or soil. (Brunone-PTT)

INFLUENCE OF WATER CHEMISTRY ON SUSPENDED SOLIDS IN COAL MINE SEDIMENTATION PONDS.
Kentucky Agricultural Experiment Station, Lexington. Dept. of Agronomy.
V. P. Evangelou.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 428-434, July/September 1990. 3 fig, 5 tab, 25 ref.

Descriptors: *Coal spoil, *Kentucky, *Salinity, *Sedimentation basins, *Suspended solids, *Waste disposal, *Waste treatment, *Water quality, Coal mine effects, Conductivity, Dispersion, Flocculation, Repulsion, Sediment control.

In Kentucky, water quality in coal mine sedimentation ponds is lowered by high concentrations of suspended solids. Spoil samples from surface mine sites in eastern and western Kentucky were equilibrated with distilled water to evaluate their effects on suspended solids. The results demonstrate that small changes in salt concentration have large effects on suspended solid concentration. Furthermore, it was determined that for the ranges of water chemistry encountered in such environments, there is a linear relationship between the repulsive index (RI) and suspended solids. Increasing the electrical conductivity reduces RI and increases the rate of settling. The trapping efficiency of sedimentation ponds during base flow is highly dependent on the physicochemical forces dictating dispersion/flocculation processes. (Author's abstract)

INFLUENCE OF IMMOBILIZATION SUPPORTS ON KINETIC CONSTANTS OF ANAEROBIC PURIFICATION OF OLIVE MILL WASTEWATER.
Instituto de la Grasa y sus Derivados, Seville (Spain).
J. A. Fiestas, A. Martin, and R. Borja.
Biological Wastes BIWAED, Vol. 33, No. 2, p 131-142, 1 fig, 12 tab, 4 ref, 1990.

Descriptors: *Anaerobic digestion, *Industrial wastewater, *Kinetics, *Wastewater treatment, Automation, Bacteria, Biological treatment, Biological wastewater treatment, Chemical oxygen demand, Computer programs, Fluidized bed process, Montmorillonite.

Studies are made of the anaerobic digestion of olive mill wastewater (OMW) using bioreactors housing various suspended supports for immobilization of the microorganisms. The OMW inhibited the digestion as the digester loadings increased, and support medium affected the inhibition. Data were obtained by applying the international Time Series Processor (TSP) computer program version 4.0 through the Roediger equation. These data show the influence of the different supports used to immobilize the bacteria on the biomethanation of OMW; this is of relevance to the development of fluidized-bed processes. Olive mill wastewater inhibits anaerobic digestion by itself, probably through some inhibitor it may contain along with biodegradable material. The inhibition was also observed in the presence of the supports tested, and was enhanced by polyvinyl chloride. The critical inhibition concentration ranged between 18 and 20 g chemical oxygen demand/L for the reference digester and for those containing saponite, Pangel and Pansil. The supports influenced both the rate of gas production and the coefficients of yields. Recommending a particular support is rather difficult as their kinetic features do not match their coefficients of yield; however, montmorillonite seems to be suitable for using media of low charge densities. START-UP IN ANAEROBIC TREATMENT OF NATURAL-RUBBER EFFLUENT.
Regional Research Lab., Trivandrum (India).
A. Pandey, L. G. Radhika, and S. V. Ramakrishna.
Biological Wastes BIWAED, Vol. 33, No. 2, p 143-147, 3 tab, 7 ref. 1990.

Descriptors: *Anaerobic digestion, *Industrial wastewater, *Rubber, *Wastewater treatment, Bacteria, Biological treatment, Biological wastewater treatment, Hydrogen ion concentration, Methane.

In setting up an anaerobic process for industrial wastewater treatment one of the major problems is the acclimatization of the bacterial population to the particular effluent. Natural rubber industry effluent, which is a highly complex waste, car significantly upset a balanced living system which is well-set and acclimatized for biomethanation. The present investigation was undertaken to focus the attention on the start-up of anaerobic digestion of natural rubber effluent, and on the problems encountered during the process. Laboratory experiments were carried out to compare the controlled and uncontrolled start-up of the anaerobic treatment of natural rubber effluent. It was found that a pH-controlled start-up was much more promising than an uncontrolled one. The biogas production was higher and a shorter period for stabilization was required in the pH-controlled systems. (Lantz-PTT)

MECHANISMS OF COMPRESSIBLE SLUDGE CAKE SHRINKAGE.
Stevens Inst. of Tech., Hoboken, NJ. Dept. of Civil, Environmental and Coastal Engineering.
B. R. Bierck, and R. I. Dick.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 663-682, July/August 1990. 14 fig, 1 tab, 25 ref, append. NSF Grant CEE-8414614.

Descriptors: *Activated sludge process, *Filtration, *Mathematical models, *Sludge cake, *Wastewater treatment, Filter media, Synchrotron X-ray fluorometry, Young-Laplace equation.

Shrinkage can bring about a significant consolidation of saturated filter cakes, and can result in the production of a filtrate that must be omitted from specific resistance calculations. Shrinkage results when curved air/liquid interfaces, which are bounded by solids, form at filter cake surfaces following the formation of the cake. The resultant decrease in pore water pressure is described by the Young-Laplace equation, which is used to express mathematically the effective stress which is causing shrinkage. In-situ pore water pressure measurements corroborate the onset of shrinkage of a kaolin filter cake. Synchrotron x-rays were used to monitor temporal and spatial changes in the concentration of cake-suspended solids. Significant shrinkage of an activated sludge filter cake was observed. Data on the concentration of cake-suspended solids are combined with filtrate production data to obtain singular values of the mass deposited per unit volume of filtrate of the cake-suspended solids produced by a kaolin slurry and an activated sludge. When shrinkage was ignored, calculated specific resistance valves for the kaolin slurry and activated sludge were in error by 10% and 23%, respectively. If the specific resistance test is to be standardized, means for accounting for effects of shrinkage must be included. (King-PTT)

IMMOBILIZED-CELL DEGRADATION OF CHLOROPHENOLS.
Pennsylvania Univ., Philadelphia. Dept. of Systems Engineering.
W. K. Shieh, J. A. Puhakka, E. Melin, and T. Tuhkanen.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 683-697, July/August 1990. 7 fig, 24 ref.

Descriptors: *Biodegradation, *Biological wastewater treatment, *Chlorinated hydrocarbons, *Phenols, *Wastewater treatment, Bacteria, Biological treatment, Gas chromatography, Mass spectrometry, Microcarriers, Organic carbon, Parachlorophenol, Phenolic pesticides, Secondary wastewater treatment.

The ability of immobilized cells grown under oxic and fluidized conditions to degrade 4-chlorophenol (4-CP) and 2,4-dichlorophenol (2,4-DCP) is evaluated under different dilute rate conditions. Microcarriers with 6.5 micron pores are employed for cell immobilization and retention. Results indicate that with feed 4-CP and 2,4-DCP concentrations at 35.7 and 45.3 mg/l, good and stable removal performance is achievable at empty-bed hydraulic retention times as low as one hour. Stoichiometric release of chloride and removal of total organic carbon are also observed, implying that complete mineralization of 4-CP and 2,4-DCP is attainable. This observation is further validated with gas chromatography/mass spectrometry (GC/MS) data obtained in the 2.4-DCP experimentation. Colonization of immobilized cells on the microcarrier surface is a slow but selective process. Extensive growth of filamentous bacteria is observed, with rod-shaped bacteria grown underneath and adhered to the filaments. Detachment of immobilized cells from the microcarrier surface is negligible. The formation of microbial films on the micro-

carrier surface with measurable thickness is absent. (Author's abstract)

FIELD PERFORMANCE OF ACTIVATED CARBON ADSORPTION FOR SEWAGE AIR.
National Univ. of Singapore. Dept. of Civil Engineering.
L. C. C. Koe, and N. C. Tan.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 721-734, July/August 1990. 7 fig, 4 tab, 9 ref.

Descriptors: *Activated carbon, *Advanced wastewater treatment, *Hydrogen sulfide, *Odor control, *Wastewater treatment, Carbon column, Wastewater management.

Sewage at the inlet works of a municipal wastewater treatment plant, was simultaneously pumped through two pilot columns, one filled with an alkali-impregnated carbon material, while the other was filled with a nonalkali-impregnated grade. Odor and H2S concentrations at the influent and effluent ports of the carbon columns were continuously monitored for about eight months. The odor and H2S concentrations of the influent sewage air varied significantly throughout the study period, averaging 120 standard odor units/cubic m and 5.3 ppm, respectively. Breakthrough of odor at the effluent ports occurred earlier than that for H2S, and the initial breakthrough odor was exerted mainly by non-H2S compounds. Although the alkali-impregnated carbon was capable of removing a much larger quantity of H2S than the nonalkali-impregnated grade, its effectiveness in removing other odorous but non-H2S gaseous compounds was less significant. The cost of using nonalkali-impregnated activated carbon for odor removal was comparable to that of the alkali-impregnated carbon. This cost comparison, however, ignores the effect of regeneration of the carbons. (Author's abstract)

VIRUS REMOVAL BY SAND FILTRATION OF SEPTIC TANK EFFLUENT.
Arkansas Univ., Little Rock. Dept. of Electronics and Instrumentation.
M. A. Gross, and D. Mitchell.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 711-720, July/August 1990. 3 fig, 2 tab, 16 ref.

Descriptors: *Sand filters, *Sand filtration, *Septic tanks, *Septic wastewater, *Soil disposal fields, *Viruses, *Wastewater management, Enteroviruses, Physical treatment, Secondary wastewater treatment, Wastewater treatment, Water quality.

Septic tank effluent (STE) is applied to stratified sand filter columns at a rate of 6.1 cm/day or 1.5 l/day/sq ft demonstrated the ability of the sand filter to remove enteric viruses. The sites of virus retention were determined. Seven 10-cm diameter sand columns were constructed of 2 cm of dry, coarse sand, 10 cm of dry, fine sand, and 25 cm of coarse sand, with the sand layers separated by 5 cm of 1.9-cm rounded gravel. Household septic tank effluent containing poliovirus vaccine, type 1, strain LSc, is applied to the filters, and influent and effluent samples are collected. Enterovirus analyses were performed using plaque assays in buffalo green monkey kidney cell cultures. Following the filter runs, the columns were dissected into 2.5 cm discs and the discs were assayed for enteroviruses. The sand filter columns were found to retain all viruses when the virus loading remains less than 33,00.00 PFU/L (plaque-forming units per liter). Analyses of the filter discs showed that most viruses are retained in the top few centimeters of biologically active sand; mass balance reveals virus inactivation in the sand filter. (Author's abstract)

EFFECTS OF AMMONIA ON ANAEROBIC DIGESTION OF SIMPLE ORGANIC SUBSTRATES.
Manitoba Univ., Winnipeg. Dept. of Civil Engineering.
D. M. Heinrichs, H. M. Poggi-Varaldo, and J. A. Oleszkiewicz.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 698-710, July/August 1990. 6 fig, 4 tab, 25 ref, append.

Descriptors: *Ammonia, *Anaerobic digestion, *Inhibition, *Wastewater treatment, Biodegradation, Biological treatment, Biological wastewater treatment, Microbial degradation, Nitrogen, Wastewater reactors.

The effects of ammonia on mesophilic digestion of acetate, propionate, acetate-propionate mixtures and lactate were studied in batch serum bottles. The un-ionized ammonia nitrogen (UAN) affected the acetate-utilizing microorganisms in the acclimated mixed cultures to a greater extent than propionate utilizing bacteria of other trophic groups. Effects of the un-ionized ammonia on soluble organic carbon (SOC) removal and methane/biogas generation were less severe in bottles supplemented with sulfate, suggesting the development of an SOC sink mediated by sulfate-reducing bacteria. Analysis of the inhibition patterns of methane/biogas production has shown that UAN displayed a moderate half-kill dose (in the range of 10 millimoles) and demonstrated a high sensitivity exponent. This suggests the potential for a sudden failure response by an anaerobic system subjected to an increasing ammonia concentration in the reactor. (King-PTT)

UNDERSTANDING THE EFFECTS OF OZONATION ON A COMBINED MUNICIPAL/INDUSTRIAL SECONDARY EFFLUENT.
North Dakota State Univ., Fargo. Dept. of Civil Engineering.
R. Zimmerman, and D. Richard.
Ozone: Science and Engineering OZSEDS, Vol. 12, No. 2, p 107-114, 1990. 5 fig, 6 ref.

Descriptors: *Biochemical oxygen demand, *Effluents, *Ozonation, *Wastewater treatment, Industrial wastewater, Municipal wastewater, Organic matter, Ozone.

An increase in the biodegradability of secondary effluent after ozonation, as measured by CBOD5 (carbonaceous BOD5), generally has been considered to be due to the conversion of non-biodegradable organic material. Experiments on a specific combined municipal/industrial waste containing a high percentage of malting plant wastewater showed that an increase in CBOD5 realized at the waste treatment plant was due to a shift in the oxygen uptake curve. Ozonation was found to affect both non-biodegradable and biodegradable organic matter and resulted in improved overall effluent quality despite the observed increase in CBOD5. As an indication of effluent quality, the CBOD5 test is felt to be inadequate. (Author's abstract)

EVALUATION OF EMPIRICAL PROCESS DESIGN RELATIONSHIPS FOR OZONE DISINFECTION OF WATER AND WASTEWATER.
Alberta Univ., Edmonton. Dept. of Civil Engineering.
G. R. Finch, and D. W. Smith.
Ozone: Science and Engineering OZSEDS, Vol. 12, No. 2, p 157-175, 1990. 7 fig, 3 tab, 16 ref.

Descriptors: *Ozonation, *Wastewater treatment, *Water treatment, Disinfection, Escherichia coli, Ozone, Performance evaluation, Statistical methods.

Research to examine the dose-response of Escherichia coli ATOCC 11775 in an ozone demand-free phosphate buffer solution and in a high quality secondary wastewater effluent with a total organic carbon content of 8 mg/l and a chemical oxygen demand of 26 mg/l was undertaken. The studies were conducted in bench scale batch reactors for both water types. In addition, studies using secondary effluent also were conducted in pilot scale, semi-batch reactor to evaluate scale-up effects. It was found that the ozone dose was the most important design parameter in both types of water. Contact time was of some importance in the ozone demand-free water and had no detectable effect in the secondary effluent. Contact time was of some importance in the ozone demand-free water and had no detectable effect in the secondary effluent. Pilot plant data confirmed the results obtained at bench-scale for the secondary effluent. Regression analysis of the logarithm of the E. coli response on the logarithm of the utilized ozone dose revealed that there was lack-of-fit using the model form which has been used frequently for the design of wastewater disinfection systems. This occurred as a result of a marked tailing effect from the log-log plot as the ozone dose increased and the kill increased. It was postulated that this was caused by some unknown physiological differences within the E. coli population due to age or some other factor. (Author's abstract)

EFFECT OF SELECTED RCRA COMPOUNDS ON ACTIVATED SLUDGE ACTIVITY.
Sirrine Environmental Consultants, Greenville, SC.
V. T. Volskay, C. P. Grady, and H. H. Tabak.
Research Journal of the Water Pollution Control Federation JWPFA5, Vol. 62, No. 5, p 654-664, July/August 1990. 6 fig, 10 fig, 25 ref. EPA Cooperative Agreement CR-813382-01-0.

Descriptors: *Activated sludge, *Inhibition, *Resource Conservation and Recovery Act, *Wastewater treatment, Butanoic acid, Butyric acid, Chlorinated hydrocarbons, Fate of pollutants, Kinetics, Mathematical models, Model studies, Organic compounds, Respiration, Toxicity.

A pilot plant study was undertaken to better understand the fate and effects of 33 organic compounds listed in the Resource Conservation and Recovery Act (RCRA) on the activated sludge process. Eleven were insufficiently inhibitory to justify further testing and eight had responses that varied over time making it impossible to quantify their efforts. The kinetic impacts of the remaining 14 (carbon tetrachloride, chlorobenzene, chloroform, 1,2-dichloroethane, 1,2-dichloropropane, 2,3-dimethyl phenol, methylene chloride, nitrobenzene, phenol, tetrachoroethylene, toluene, 1,1,1-trichloroethane, 1,1,2-trichloroethane, and trichloroethylene) were quantified by measuring the Monod kinetic parameters for butyric acid degradation in the presence of several inhibitor concentrations using a respirometric-based assay. Attempts to model the effects of inhibitor concentration on the Monod kinetic parameters with classical linear, reversible inhibition models were unsuccessful but it was possible to model them with a general inhibition model proposed by Han and Levenspiel. LIBRARY U. OF T. ENVIRONMENTAL

Descriptors: *Activated sludge, *Giardia, *Giardiasis, *Human diseases, *Secondary wastewater treatment, *Wastewater treatment, Biological wastewater treatment, Disinfection, Primary wastewater treatment, Trickling filters, Water quality.

Giardiasis is one of the most commonly identified waterborne intestinal diseases in the U.S.A. person infected with Giardia lamblia may shed on the order of ten to the eighth cysts/day, which may be collected in wastewater. Studying the removal of giardia cysts by selected unit processes during wastewater treatment at three wastewater treatment plants in the U.S. was the objective of this research. Background data were obtained during a nationwide study of cyst concentration in raw and treated wastewaters. These data suggest seasonal and geographic differences in Giardia cyst concentrations in raw wastewater. More intensive sampling indicated that cysts are removed with varying effectiveness during primary clarification and almost completely removed in the biological treatment processes. However, a direct comparison of cyst removal efficiencies showed that cyst concentrations in the trickling filter effluent were higher than in the activated sludge process effluent. These data also suggest that cysts are concentrated in the mixed liquor suspended solids and, thus in the sludges. (Author's abstract)

PERFORMANCE OF FOUR FULL-SCALE NITRIFYING WASTEWATER TREATMENT PLANTS INCORPORATING SELECTORS.
CH2M/Hill, Denver, CO.
G. T. Daigger, and G. A. Nicholson.
Research Journal of the Water Pollution Control Federation JWPFA5, Vol. 62, No. 5, p 676-683, July/August 1990. 8 fig, 2 tab, 20 ref.

Descriptors: *Activated sludge, *Bulking sludge, *Nitrification, *Secondary wastewater treatment, *Wastewater facilities, *Wastewater treatment, Aerobic sludge, Anaerobic sludge, Anoxic sludge, Biological treatment, Filamentous bulking, Selectors.

The effect of installing selectors to control filamentous bulking at four full-scale nitrifying wastewater treatment plants was evaluated. The results indicate that a selector can be effective in controlling filamentous sludge bulking. Little difference in effectiveness was observed for aerobic, anaerobic, or anoxic selectors. Long-term operating data indicate that selectors, coupled with an appropriate aeration basin configuration, are capable of producing a nonbulking activated sludge with a sludge volume index (SVI) of less than 150 ml/g. Average SVI's in the 60 to 90 ml/g range can be expected with values as low as 20 to 30 ml/g observed on occasion. An aerobic selector was not effective in controlling bulking in a complete-mix nitrifying system using surface mechanical aerators. (Author's abstract)

CHEMOSTAT STUDIES OF A MIXED CULTURE GROWING ON PHENOLICS.
Melbourne Univ., Parkville (Australia). Dept. of Microbiology.
M. J. Hobson, and N. F. Mills.
Research Journal of the Water Pollution Control Federation JWPFA5, Vol. 62, No. 5, p 684-691, July/August 1990. 6 fig, 2 tab, 35 ref.

Descriptors: *Biological treatment, *Culturing techniques, *Growth chambers, *Phenols, *Secondary wastewater treatment, *Wastewater treatment, Bacterial growth, Chemostat, Industrial wastes, Inhibition, Kinetics.

Phenolics are common constituents of aqueous effluent from coal-conversion processes, coking plants, petroleum refineries, and several chemical industries including pharmaceutical, fertilizer, and dye manufacturers. The growth of a mixed culture in a two-stage chemostat with growth limited by phenolics was studied. The first stage provided a fully viable, adapted population that was fed at a constant rate to the second stage, where the concentration of phenolics could be varied. The population exhibited inhibition kinetics at high concentrations of phenolics. The viability of the culture decreased with increasing dilution rate, or with increasing phenolic concentration. The nonviable population did not utilize significant amounts of substrate, but ignoring viability can lead to a significant underestimate of the growth rate. The maintenance requirements were insignificant at noninhibitory levels of phenolics, but rose to 0.15 g/gh at inhibitory levels, possibly due to the need to repair damaged cell membranes. (King-PTT)

ECONOMIC CONSIDERATIONS IN WASTEWATER TREATMENT WITH DUCKWEED FOR EFFLUENT AND NITROGEN RENOVATION.
Ben-Gurion Univ. of the Negev, Sde Boker (Israel). Jacob Blaustein Inst. for Desert Research.
G. Oron.
Research Journal of the Water Pollution Control Federation JWPFA5, Vol. 62, No. 5, p 692-696, July/August 1990. 4 fig, 4 tab, 18 ref.

Descriptors: *Agronomy, *Ammonia removal, *Duckweed, *Economic aspects, *Farm wastes, *Wastewater treatment, Agricultural engineering, Biological treatment, Domestic wastewater, Fertilizers, Irrigation.

Duckweed is one of the floating aquatic macrophytes with a preference for ammonia uptake. The ammonia is assimilated into valuable nitrogen compounds that can subsequently be used for animal feed or agricultural fertilization. Outdoor experiments were conducted in shallow miniponds which were 20 to 30 cm deep to evaluate the performance of the duckweed species, Lemna gibba, as a stripper for domestic wastewater. The results indicate that under adequate operational conditions the quality of accepted secondary effluents meets irrigation reuse criteria. The annual yields of dry duckweed which is harvested two to three times a week, is anticipated to be about 55 tons/ha, with a protein content close to 30%. The benefit of the additional byproduct means a reduction in wastewater expenses in the range of $0.020 to $0.050/cubic m. (Author's abstract)

PERFORMANCE OF LAGOON INTERMITTENT SAND FILTER SYSTEMS.
Clemson Univ., SC. Dept. of Environmental Systems Engineering.
L. Rich, and E. J. Wahberg.
Research Journal of the Water Pollution Control Federation JWPFA5, Vol. 62, No. 5, p 697-699, July/August 1990. 4 tab, 7 ref.

Descriptors: *Ammonia removal, *Sand filters, *Wastewater lagoons, *Wastewater treatment, Activated sludge, Biological oxygen demand, Biological treatment, Lagoon performance, Suspended solids.

The performance of nine lagoon intermittent sand filter systems were evaluated with respect to the biological oxygen demand (BOD), total suspended solids (TSS), and NH3 nitrogen removed. All systems were located either in South Carolina or Georgia and had permitted flow limits ranging from 303 cubic m/d to 12869 cubic m/d. The average 50% values for BOD, TSS and NH3-N were found to be 19, 25, 3.1 mg/l. The superior performance of the lagoon intermittent sand filter systems over aerated lagoons and most activated sludge systems was demonstrated. (Author's abstract)

PROCESS CONTROL STRATEGY FOR THE BIOLOGICAL REDUCTION OF PHOSPHOROUS AND AMMONIA NITROGEN UTILIZING THE A/O PROCESS.
PSC Environmental Services, Limerick, PA.
J. C. Hale.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 2, p 37-41, March/April 1990. 9 fig.

Descriptors: *Activated sludge process, *Ammonia, *Biological wastewater treatment, *Nitrification, *Phosphorous removal, Regulations, *Wastewater treatment, Advanced wastewater treatment, Process control, Sludge treatment.

The A/O Process is a process control wastewater treatment system which biologically reduces phosphorous and ammonia nitrogen without the use of chemical addition. Two currently operative treatment plants are the Patapsco WWTP in Baltimore, Maryland which utilizes this process for phosphorous removal, and the Oaks WWTP in Oaks, Pennsylvania which uses the A/O process for ammonia nitrification. Since it is much more sensitive than conventional activated sludge methods, constant monitoring is necessary to control the return and waste sludge and oxygen flows. By utilization and analysis of the indicator parameters; namely, oxygen uptake and sludge generation rates, effluent quality, and SVI, the A/O Process can be effectively controlled within each plant to achieve full compliance with NPDES permit requirements. PHYSICO-CHEMICAL TREATMENT OF WASTEWATER: EXPERIENCE AND FUTURE DEVELOPMENT.
Energy and Waste Systems Ltd., Westbury (England).
D. E. Smith.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 307-318, 6 fig, 5 tab, 10 ref.

Descriptors: *Coagulation, *Lime, *Physicochemical treatment, *Wastewater treatment, Bacteria, Clarification, Coliforms, Disinfection, Parasites, Seawater, Sludge blanket reactors, Suspended solids, Viruses, Wastewater reactors.

Using lime-based coagulants in a high-rate upward flow blanket (UFSB) clarification process, substantial amounts of suspended solids and the biochemical load associated with these solids can be removed from sewage. Furthermore, on dilution in seawater, treated effluent from the process has shown enhanced T90 data with respect to bacteria die-off, making the process particularly effective in bacterial reduction for estuarine and marine discharge. The single stage UFSB process is extremely good at removing solids (up to 90%) from highly contaminated wastewater, and the blanket process allows results seen in laboratory settlement tests to be obtained, or even improved upon, at full scale under diurnal flow regimes. Insoluble biochemical oxygen demand is reduced and typical reductions of 50-70% have been achieved. The process can be quickly and easily retrofit to existing works to uprate performance. The removal of large populations of bacteria from sewage has resulted in Sandown Bay, England being in compliance with the European Community Directive for bathing Waters despite the short sea outfall extending only 300 meters below low water. Recent laboratory work has shown that there is great potential for the removal of salmonella, parasites, ascaris and viruses in the blanket process under the good clarification and highly alkaline conditions. Initial studies suggest that the system would enable the Engleberg guidelines for the reuse of wastewater in agriculture and aquaculture to be met in a high-rate, low-cost process as a useful alternative to stabilization ponds. escriptors: *Disinfection, *England, *Swimming, Wastewater treatment, *Water pollution control, Water quality, Chlorination, Coliforms, Environental effects, Fish, Toxicity, Water quality conol, Weston Bay.

essex Water's surveys highlighted the need for medial action at Weston-super-Mare, England. A mporary scheme to disinfect sewage discharged sea was proposed while long-term requirements ere determined. Discharge water was chlorinated the outfall site. Noncompliance with 95% limits coliforms were noted due to tidal action and e presence of particulate matter in crude sewage at needed to be macerated to better expose bacteI populations to chlorine. Biological surveys of intertidal regions and rocky outcrops within eston Bay have not shown any detectable shortm effects on fauna or flora due to organochlorformation. Tests with peracetic acid products owed that a switch to alternative disinfectants uld be too costly at the present time. Trials with eens at Black Rock Pumping Station did not prove bacterial quality, but an overall improvent in the bathing water's quality is anticipated m screening. A scheme to install a flash mixer t and contact tank is expected to further imve the quality of bathing water. (See also W91-11) (Geiger-PTT)

ANAEROBIC DIGESTION OF INDUSTRIAL AND AGRICULTURAL WASTES.
CLEAR Ltd., Cardiff (Wales).
S. P. Etheridge, and U. E. A. Leroff.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 417-426, 5 fig, 1 tab, 12 ref.

Descriptors: *Anaerobic digestion, *Farm wastes, *Industrial wastes, *On-site wastewater treatment, *Waste disposal, *Waste treatment, *Wastewater treatment, Agricultural runoff, Europe, Fertilizers, Food-processing wastes, Manure, Municipal wastes, Sludge disposal, Solid waste disposal, Water quality standards.

The future of water quality in Europe depends on the ability to reduce the pollution load of wastewaters discharged to the environment and the subsequent ability to clean abstracted water for reuse. The prospect of European unity in 1992 will allow commercial competition for waste treatment and all European technologies in this area will become fully cross-fertilized. Increasing standards will result in increased treatment and disposal costs which will be passed on to the consumer. Anaerobic treatment systems will become an attractive option for wastewater treatment because they produce little sludge and so do not incur expensive tankering charges. Farm wastes are some of the most concentrated wastes produced and their runoff results in serious water pollution problems. Anaerobic digestion of agricultural wastes is most attractive due to its short payback time (4-5 yr). Several low cost agricultural digesters, including flexible liner digesters and fiberglass plugflow digesters, offer quicker payback periods. Due to recent advances in anaerobic digestion technology, more industrial wastewaters are becoming amenable to anaerobic treatment. These advances include the development of the fixed film reactors such as the Upflow Anaerobic Sludge Blanket and the Anaerobic Attached Film Expanded Bed digester. Moisture limitations for anaerobic digestion can now be controlled to make high solids digestion possible. As emission standards cause the costs of incineration to rise, anaerobic digestion will offer an attractive alternative for the treatment and disposal of municipal solid wastes. INDUSTRIAL EFFLUENTS: MINIMIZING ENVIRONMENTAL IMPACT.
Watson Hawksley, High Wycombe (England).
A. V. Gray.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 427-436, 4 fig, 9 tab.

Descriptors: *Environmental effects, *Environmental impact, *Industrial wastewater, *Wastewater treatment, *Water pollution control, Case studies, Chemical oxygen demand, Cost analysis, Food-processing wastes, Lime, Physicochemical treatment, Oil industry, Recycling, Sludge disposal, Waste characteristics, Waste disposal, Water quality standards.

The strategy and methodology employed in ensuring minimal environmental impact from the disposal of industrial effluents involves definiation of the problem and all its component parts, data collection and monitoring (effluent characterization) comparison with appropriate environmental standards, evaluation of technically feasible options, and recommendations for implementation. Three case studies are reviewed to illustrate some of the problems faced. In the first case, a treated waste from a petrochemical industry was being discharged into a small estuary without meeting water quality standards for ammonia. In this case cordial liaison between the regulatory agency and the industrialist led to an agreement to substantially improve the discharged waste quality by providing for a fully nitrified effluent, possibly by employing an extended aeration plant or an oxygen activated sludge facility to achieve the necessary 87% ammonia reduction. In the second case a building materials manufacturer experienced a buildup of waste sludge due to lime neutralization of acid scrubber gases. It was recommended that the system be operated not as a closed-loop but with a blow-down or draw-off from the recirculated water with clean water added for volume make-up. Operation of the plant in this manner permitted a stable condition to be achieved within the recirculated liquors. Studies of disposal options led to the choice to lime treat the blow down liquors, allow sufficient settlement for solids removal, and then recirculate the treated supernatants back to one of the process stages. In the third case, a food processing industry exceeded consent conditions (in particularly COD) for discharging trade effluents to sewers. To remedy this situation, cost analyses and feasibility studies have demonstrated that an on-site treatment plant using physicochemical treatment plus wastes/sludge disposal off-site or sludge consolidation on site would be viable options. ADVANCED NITROGEN REMOVAL PROCESSES FOR DRINKING AND WASTE WATER TREATMENT.
Biwater Ltd., Heywood (England).
B. Lacamp, and M. M. Bourbigot.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 437-443, 5 fig, 4 tab, 31 ref.

Descriptors: *Biofiltration, *Biological treatment, *Biological wastewater treatment, *Drinking water, *Nitrogen removal, *Wastewater treatment, *Water treatment, Aeration, Aerobic digestion, Ammonia, Denitrification, Nitrates, Nutrient removal, Suspended solids.

Biological methods are commonly used for nitrogen removal in wastewater and water treatment. However, in urban areas where space is scarce, basin volume may not be sufficient for purification of activated sludges. Biological Aerated Filters (BAF), an innovative technology for plant upgrading can combine aerobic degradation of pollutants with physical retention of suspended solids in one reactor. In BAF, a high concentration of active biomass can be retained in the packed bed, while nitrifying bacteria can be attached to the filter media. Removal efficiency becomes independent of clarification and sludge settling, and ammonia oxidation can be achieved without sludge age requirements. In drinking water treatment, use of fixed film processes have become widespread for nitrate and ammonia removal due to their similarity to conventional filters. These biological processes all profit from natural phenomena of nutrient removal while reducing costs and improving water quality. (See also W91-01211) (Author's abstract)

LIBRARY U. OF I. URBANA CHAMPAIGN

ment, *Water pollution control, Europe, Hogs, Nutrients, Recycling, Stabilization lagoons.

Waste deriving from the raising of animals constitutes a problem which could reach serious proportions in rural areas of southern Europe. In these areas, the occurrence of dry periods justifies value-enhancement strategies for reutilization of the liquid wastes generated by animal husbandry. High-rate algal ponds (stabilization lagoons), use of wastes generated by pig farms as feed (nutrient recovery), and reutilization of liquid wastes for irrigation and fertilization make it possible to recycle a considerable proportion of the nutrients in these wastes. The standards governing the discharge of liquid wastes should take these factors into account and incorporate an ecologically-based strategy of integrated management of resources, rather than a strictly bio-destructive one. The establishment of low-energy-cost technologies for solid/liquid separation (sedimentation and filtration techniques) can help to minimize negative effects and maximize the benefits of integrated management of animal wastes. Portugal has drawn up permit requirements for pig breeders to ensure that liquid residues from raising livestock meet discharge standards. (See also W91-01211) (Geiger-PTT)

CONTROL OF NITROGENOUS POLLUTION.
Surrey Univ., Guildford (England). Dept. of Chemical Engineering.
M. A. Winkler, and V. S. Manoranjan.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 463-473, 4 ref.

Descriptors: *Denitrification, *Nitrogen removal, *Wastewater treatment, *Water pollution control, *Water quality control, *Water treatment, Ammonia, Electrodialysis, Fertilizers, Ion exchange, Nitrates, Nitrogen compounds, Physicochemical treatment, Reverse osmosis.

Nitrogen compounds found in water can contribute to many aspects of environmental pollution. In water, nitrogenous pollutants can have toxic effects, including acting as carcinogen precursors, stimulate deoxygenation and eutrophication in rivers and interfering with purification processes. Nitrogenous pollutants are very common, occurring in domestic, agricultural and industrial wastes; distributed as fertilizers and formed naturally by living organisms and lightning. Techniques for conversion and removal of nitrogen compounds from water and wastewater are well developed. In wastewater treatment, ammonia is oxidized microbiologically to nitrate, which is then removed by microbiological denitrification where sufficient substrate is available. In high-nitrogen industrial wastewaters, substrate may have to be added. A wide range of nutrient waste-products can be used for this purpose. In water purification, there may be insufficient dissolved oxygen for ammonia oxidation and/or organic substrate for microbiological denitrification. Several physicochemical methods, such as reverse osmosis, electrodialysis and ion-exchange processes are commercially available. (See also W91-01211) (Author's abstract)

VARIABILITY REDUCTION MODEL FOR WASTEWATER TREATMENT.
Surrey Univ., Guildford (England). Dept. of Chemical Engineering.
V. S. Manoranjan, and M. A. Winkler.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 515-518, 6 ref.

Descriptors: *Mathematical models, *Variability, *Wastewater treatment, Optimization, Process control, Statistical methods, Systems analysis.

Mathematical models and controlled experiments have been useful in understanding the mechanisms of various process steps in wastewater treatment. However, it is nevertheless difficult to forecast accurately the output quality of a full-scale treatment plant from knowledge of the input to the plant due to random fluctuations in feed. Time-series models could predict the output quality as part of a feed-forward/feed-back control system, but the predicted effluent quality may not fall within the required target range. Statistical optimization techniques have been successfully used in Japan to reduce the variability of manufacturing processes. Such techniques known collectively as the Taguchi method, modify the system to reduce its sensitivity to the causes of variability, rather than attempt to control the actual sources of variability. In the Taguchi procedures, the normal and test settings of the control factors are established and the noise factors and their ranges are identified. The noise and control factor matrices are then constructed. These matrices are intelligent subsets of control and noise spaces which provide appropriate coverage of these spaces. Standard methods of statistical experimental design can be used, such as mutually orthogonal Latin squares but fractional replication and Graeco-Latin squares require less test runs. The signal to noise ratio is evaluated for each combination of variables tested, and from these data, the settings that maximize the performance measure can be predicted. Maximizing the performance measure is equivalent to reducing variability, which means that the predicted settings should also give minimum variation in the output quality of the treatment plant. In wastewater treatment, controlling the sources of variability is usually impossible or expensive. The present technique may be amenable to modifications to make it suitable for wastewater treatment processes. (See also W91-01211) (Author's abstract)

ODOUR CONTROL FOR THE 1990S--HIT OR MISS.
WRc Engineering, Swindon (England).
S. J. Toogood.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 268-275, June 1990. 8 ref.

Descriptors: *Biological wastewater treatment, *Odor control, *Public nuisance, *Ventilation, *Wastewater treatment, Adsorption, Air pollution control, Biofiltration, Chemical treatment, Dispersion, Model studies, Odor-producing algae, Odors, Oxidation.

A general strategy for dealing with odor problems at a sewage works, once the use of preventative measures alone has been ruled out is presented. A strategy for dealing with nuisance emphasizes a fully integrated approach, involving covering, ventilation design, and odor treatment. Some of the options for treatment are compared, including adsorption, dry oxidizing packings, wet chemical scrubbing and biological odor control processes (i.e., biofilters and bioscrubbers). The objective of any odor control scheme is to eliminate nuisance, not eliminate odors. The use of dispersion models can be used to determine the extent of remedial works, and acting early in the complaint process can result in a cost effective solution. It is concluded that biological treatment is the most generally applicable method to the sewage works. (VerNooy-PTT)

Descriptors: *Biofilms, *Biological wastewater treatment, *Contact beds, *Gravel, *Hydrophytes, *Hydroponics, *Reeds, *Secondary wastewater treatment, *Tertiary wastewater treatment, *Wastewater treatment, Biochemical oxygen demand, Databases, Design criteria, Developing countries, Dolerite, Effluents, Limestone, Rural areas.

Gravel bed hydroponic (GBH) systems planted with emergent hydrophytes, such as Phragmites australis (the common reed), treat domestic sewage effluents to acceptable environmental standards in an economic and efficient manner. Biochemical oxygen demand (BOD), ammonia, and coliform bacteria can be reduced by over 90% and dissolved oxygen (DO) substantially increased. In temperate zones, such as Europe, GBH systems can be used to replace conventional small rural treatment works, and for tertiary treatment of final effluents. In tropical and arid zones, GBH systems can provide locally-managed, cost-effective alternatives to high-technology systems which are inappropriate for use in developing countries. In the UK, the final effluent of the biological treatment works at one site was taken as feed water for three beds of different characteristics. Samples were collected monthly to provide successive sampling cohorts. The results form a multivariate database which will be used to identify design parameters for GBH systems. In Egypt, settled sewage from Abu Attwa is used as feed water after the grit, silt and heavy solids which bypass the overloaded works have been removed by resettlement in a dedicated humus tank. Preliminary results of this secondary GBH treatment reveal significant reductions in BOD on all beds, with dolerite and limestone aggregates in 100 m channels performing most efficiently. Results from both the Egyptian and UK field-scale GBH trials have demonstrated a relationship between bed length and the extent of sewage treatment. (VerNooy-PTT)

FATE OF SELECTED CHLORINATED ORGANIC COMPOUNDS DURING SEMI-CONTINUOUS ANAEROBIC SLUDGE DIGESTION.
Rentokil Ltd., East Grinstead (England). Research and Development Div.
R. S. K. Buisson, P. W. W. Kirk, and J. N. Lester.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 3, p 428-432, May/June 1990. 4 tab, 25 ref.

Descriptors: *Anaerobic digestion, *Biological treatment, *Chlorinated hydrocarbons, *England, *Pesticides, *Sludge treatment, *Wastewater treatment, Biodegradation, Digestion, Herbicides, Pollutants, Polychlorinated biphenyls.

The predominant sewage sludge treatment process in the United Kingdom is mesophilic anaerobic digestion. The fate of chlorinated organic micropollutants during this treatment process is, however, largely unknown. Laboratory scale simulations were applied to assess the fate of chlorophenoxy herbicides, chlorophenols, polychlorinated biphenyls, and organochlorine pesticides during the digestion of primary sludge and co-settled waste activated and primary sludge, obtained from full scale works. Incubation was carried out under non-sterile and sterile conditions. The use of a batch technique to study the anaerobic degradation of the chlorinated organic micropollutants permits observations on their rates of degradation. Previous studies have demonstrated that when degradation occurs, it is very rapid with micropollutants being completely removed within four days in

primary digested sludge. In the case of the mixed digested sludge which did not have such a high solids concentration and a proportion of whose solids consisted of the less readily degradable wasted mixed liquor solids, the rate of degradation was not as rapid. This lower inherent biodegradability was illustrated by a subsequent continuous digestion study in which gas output was lower from the mixed sludge digester. However, the rate of degradation was still sufficiently rapid to remove the micropollutants within one retention time of a typical sludge digester. (Mertz-PTT)

ANAEROBIC TREATMENT OF BAKER'S YEAST WASTEWATER: II. SULFATE REMOVAL.
British Columbia Univ., Vancouver. Dept. of Bio-Resource Engineering.
K. V. Lo, A. Chen, and P. H. Liao.
Biomass BIOME9, Vol. 23, No. 1, p 25-37, 1990. 3 fig, 3 tab, 14 ref.

Descriptors: *Anaerobic digestion, *Biological treatment, *Contactors, *Wastewater reactors, Sulfates, *Wastewater treatment, Biomass, Chemical oxygen demand, Fixed-film reactor, Hydrogen ion concentration, Methane, Methanogenesis, Molasses, Wastewater, Yeasts.

The effect of sulfate removal from molasses wastewater on anaerobic digestion was studied using two reactors. One was an anaerobic rotating biological contact reactor with an active biomass developed on its support structure before the experiment commenced. The other was a new fixed-film reactor which was started without attached biomass. The experimental results showed that sulfate removal from the wastewater did not improve the gas production and treatment efficiency of the anaerobic rotating biological contact reactor. This observation indicated that sulfate-reducing bacteria could not compete with methane-producing bacteria in a well-established active biomass reactor. However, the fixed-film reactor showed significant improvement in gas production (0.17-0.66 L CH4/L reactor day) and chemical oxygen demand reduction (maximum of 44%) as a result of sulfate removal coupled with pH adjustment. Thus, the initial step of sulfate removal from molasses wastewater would appear to be essential to start up the reactor without well-developed biomass in order to enhance the slow-growing methanogens. REMOVAL OF ORGANOHALOGENS AND ORGANOHALOGEN PRECURSORS IN RECLAIMED WASTEWATER--I.
California Univ., Los Angeles. Dept. of Civil Engineering.
L. C. Bauman, and M. K. Stenstrom.
Water Research WATRAG, Vol. 24, No. 8, p 949-955, August 1990. 5 fig, 3 tab, 21 ref. California Department of Water Resources contract no. B56726.

Descriptors: *Disinfection, *Halogenated hydrocarbons, *Municipal wastewater, *Pesticides, *Wastewater renovation, *Wastewater treatment, *Water reuse, Chlorinated hydrocarbons, Chlorination, Drinking water, Organic matter, Tertiary wastewater treatment, Trihalomethanes.

A high level of treatment will be required if municipal wastewater effluents are to meet drinking water standards. Reclaimed wastewaters contain significant levels of potentially hazardous organohalogens derived from surface pollution. These compounds can be measured as instantaneous total organic halogens. In addition to background contaminant removal, disinfection would be of prime importance for providing a safe product for consumption. Aqueous chlorine, a cost effective and efficient disinfectant, has come under scrutiny following the discovery of trihalomethanes in drinking water. Fractionation, using synthetic resins of dissolved organic material in filtered secondary effluent from an advanced wastewater reclamation facility and unpolluted source water (based upon acidity, solubility and adsorbability), indicated a strong correlation between organohalogen formation potential and organic carbon. Background organohalogens were quantified as total organic halogens. In addition to humic substances, the classic trihalomethane precursors, hydrophilic substances that comprised the largest fraction of the dissolved material, were implicated because of their tendency to form organic halogens upon chlorination. Evaluation of an existing comprehensive advanced treatment process for reclamation of municipal wastewaters indicated that it provides a high level of treatment with respect to removal of organohalogens and precursor organics. REMOVAL OF ORGANOHALOGENS AND ORGANOHALOGEN PRECURSORS IN RECLAIMED WASTEWATER--II.
California Univ., Los Angeles. Dept. of Civil Engineering.
L. C. Bauman, and M. K. Stenstrom.
Water Research WATRAG, Vol. 24, No. 8, p 957-964, August 1990. 7 fig, 2 tab, 33 ref. California Department of Water Resources contract no. B56726.

Descriptors: *California, *Halogenated hydrocarbons, *Municipal wastewater, *Pesticides, *Wastewater renovation, *Wastewater treatment, *Water reuse, Air stripping, Carbon adsorption, Chlorinated hydrocarbons, Coagulation, Disinfection, Drinking water, Flocculation, Hydrogen ion concentration, Reverse osmosis, San Diego, Ultraviolet treatment.

The city of San Diego, CA has proposed to utilize reclaimed wastewater as a potential drinking water source. The proposal requires disinfecting and recycling effluent by mixing and storing the treated effluent with natural source waters in a reservoir for one year. The existing wastewater facility consists of primary treatment, secondary treatment, coagulation, flocculation, ultraviolet disinfection, reverse osmosis, air stripping and carbon adsorption. Treatment would potentially be followed with disinfection by chlorination. Treatment, at bench scale, of filtered secondary effluent from an advanced wastewater reclamation facility indicated that carbon adsorption and advanced oxidation each provide significant reductions in concentrations of both total organic halogens and organic halogens precursors. Equilibria and batch dynamic data suggested that multicomponent adsorption of total organic halogens and precursors was favorable and pH dependent. In addition to contact time, oxidation of total organic halogens and precursors by ozone peroxide was highly dependent upon hydrogen peroxide dosages. (See also W91-01415) (Mertz-PTT)

BIODEGRADATION AND SECONDARY EFFLUENT TOXICITY OF ETHOXYLATED SURFACTANTS.
Eckenfelder, Inc., Nashville, TN.
J. Patoczka, and G. W. Pulliam.
Water Research WATRAG, Vol. 24, No. 8, p 965-972, August 1990. 5 fig, 5 tab, 25 ref, append.

Descriptors: *Activated sludge process, *Biodegradation, *Surfactants, *Wastewater treatment, Aliphatic surfactants, Aromatic surfactants, Carbon, Chemical oxygen demand, Ethylene oxide, Sludge, Toxicity.

Several aromatic and aliphatic-based, ethoxylated surfactants were tested for their biodegradability and aquatic toxicity reduction. For all the tested surfactants, almost complete primary biodegradation by the activated sludge process was achieved as measured by the cobalt thiocyanate active substances test. Aliphatic-based products demonstrated better biodegradability in terms of total organic carbon and chemical oxygen demand reduction efficiency than aromatic-based products. Toxicities of individual surfactants, their mixtures, and effluents from biological reactors treating surfactant mixtures were determined using Mysidopsis bahia. For aromatic-based surfactants with the same ethylene oxide molar ratio, the toxicity of the non-biodegraded, aliphatic-based product was highest for the non-ionic (unsubstituted) surfactant. Toxicities of the non-biodegraded, aliphatic-based surfactants were in the same range as those of the non-biodegraded aromatic-based products. Increasing ethylene oxide molar ratios resulted in an exponential decrease in surfactant toxicities. Biological treatment of the aliphatic-based surfactants resulted in non-toxic effluents even at high (600 ml/L) influent concentrations. Effluents from reactors treating aromatic-based surfactants demonstrated markedly higher toxicities than those from treatment of aliphatic-based products. The presence of an active group appeared to have less effect on biological effluent toxicity than did the product base structure. (Author's abstract)

MODIFIED HARDWICKIA BINATA BARK FOR ADSORPTION OF MERCURY (II) FROM WATER.
National Environmental Engineering Research Inst., Nagpur (India).
A. M. Deshkar, S. S. Bokade, and S. S. Dara.
Water Research WATRAG, Vol. 24, No. 8, p 1011-1016, August 1990. 11 fig, 3 tab, 17 ref.

Descriptors: *Mercury, *Trees, *Wastewater treatment, Acetates, Bark, Chemical reactions, Coagulation, Formaldehyde, Hardwickia, Heavy metals, Hydrogen ion concentration, Nitrates, Waste treatment.

Mercury is commonly removed from wastewaters by chemical precipitation, conventional coagulation, lime softening, adsorption, ion exchange, and reverse osmosis. The use of modified tree barks was investigated for removal of heavy metals as early as 1941. Hardwickia binata bark was found to have a good sorption capacity for mercury (II), and color leaching was prevented and the physical characteristics of the bark improved by treatment with formaldehyde in an acidic medium. Studies indicated that the sorption of Hg(II) increases as

LIBRARY U. OF I. URBANA-CHAMPAIGN

the pH increases and a contact time of 2 hours was found to be optimum. Modified bark can remove most of the Hg(II) from water if its concentration is below 20 mg/L and sorption of mercury conformed to the Freundlich adsorption isotherm. The presence of light metal ions interferes with the sorption of mercury. Mg(II) at a concentration of 200 mg/L interferes with sorption to a maximum extent. Column studies showed that the capacity of the bark was 0.34 mequiv/g. In the presence of metal cations such as Pb(2+), Cd(2+), Zn(2+), and Cu(2+) the sorption of Hg(2+) was the lowest compared to other cations showing that other cations compete with Hg(2+) for sorption by the bark. Among the different anions, it was observed that sorption of mercury was maximum for acetate and nitrate (97%). The break-through sorption capacity determined by conducting a column experiment was observed to be 21 mg/g. (Mertz-PTT)

TRACER STUDY OF THE HYDRAULICS OF FACULTATIVE STABILIZATION PONDS.
AGAMIT S.A., Madrid (Spain). Environmental Engineering Dept.
M. D. Moreno.
Water Research WATRAG, Vol. 24, No. 8, p 1025-1030, August 1990. 10 fig, 2 tab, 11 ref.

Descriptors: *Retention time, *Stabilization ponds, *Tracers, *Wastewater treatment, Heavy water, Hydraulics, Model studies, Spain, Stirred tank reactor model, Water circulation.

Low-cost wastewater treatment methods have become increasingly popular in Spain in recent years, due in part to a surge in the demand for water sanitation and environmental concern in the general population. Among these methods, the most widely employed are wastewater stabilization ponds. This technique is simple, reliable and economical. It provides good-quality effluent, with a high degree of disinfection and a low content in organic matter. The hydraulic behavior of wastewater stabilization ponds operating in different regions in Spain was investigated using a stimulus-response technique. A tracer, tritiated water, was injected at the entrance of each one of the facultative ponds at five facilities. The resulting time distribution functions were used to calculate the mean hydraulic residence time and the extent of short-circuiting inside the ponds. The percentage of dead volume ranged from 10 to 42%. Treatment efficiency would thus be substantially improved by correcting these large dead volumes. The inlets and outlets of the ponds have been redesigned and are being rebuilt as remedial measures to this problem. The statistical analysis of the results indicates that the completely stirred tank reactor model can be used to represent the hydraulic behavior of all the ponds studied, at a 99% confidence level. (Mertz-PTT)

EFFECT OF FEED COMPOSITION, AEROBIC VOLUME FRACTION AND RECYCLE RATE ON NITROGEN REMOVAL IN THE SINGLE-SLUDGE SYSTEM.
Technion - Israel Inst. of Tech., Haifa. Faculty of Civil Engineering.
A. Brenner, and Y. Argaman.
Water Research WATRAG, Vol. 24, No. 8, p 1041-1049, August 1990. 6 fig, 3 tab, 10 ref, append.

Descriptors: *Mathematical models, *Nitrogen, *Nitrogen removal, *Sludge treatment, *Wastewater treatment, Ammonia, Biomass, Chemical oxygen demand, Municipal wastes, Simulation, Waste treatment.

A recently developed and experimentally validated model was used to delineate the effects of various design and operation parameters on the performance of single-sludge systems. Model simulation resulted in charts which illustrate the mutual effects of raw feed chemical oxygen demand/ammonia ratio, aerobic volume fraction and recycle rate. The most significant phenomenon, observed experimentally and supported by the simulation, is that increasing recycle may lead to increased effluent nitrate. This situation may occur under low raw chemical oxygen demand/ammonia ratios, whereas for high chemical oxygen demand/ammonia ratios, as in most domestic wastes, an opposite phenomenon occurs. This means that the recycle has an optimum value that depends on feed composition and on aerobic/anoxic fraction of the system. The presence of viable cells in the feed in significant numbers affects the composition of biomass in the system and the removal of nitrogen compounds. (Author's abstract)

CONTROL OF SLUDGE SETTLING CHARACTERISTICS IN THE SINGLE-SLUDGE SYSTEM, A HYPOTHESIS.
Technion - Israel Inst. of Tech., Haifa. Faculty of Civil Engineering.
A. Brenner, and Y. Argaman.
Water Research WATRAG, Vol. 24, No. 8, p 1051-1054, August 1990. 2 fig, 14 ref.

Descriptors: *Activated sludge process, *Bulking sludge, *Flocculation, *Nitrogen, *Sludge treatment, *Wastewater treatment, Ammonia, Chemical oxygen demand, Denitrification, Denitrifying bacteria, Filamentous bacteria, Microorganisms, Sludge.

Many studies have been carried out and many models proposed in order to understand and explain the mechanisms of bulking and bioflucculation. All of these studies related sludge bulking to the different substrate utilization rates and different growth rates of the flocculent and filamentous microbes under different operational conditions. However, denitrifying ability may affect population dynamics in activated sludge processes. Operation of activated-sludge in the single-sludge mode is suggested as an operational device for the prevention of filamentous bulking. It is hypothesized that the most filamentous microbes do not possess denitrifying ability and that the denitrifying microbes possess good steeling characteristics. It is therefore concluded that nitrogen transformations within the single-sludge system play an important role in the selection of microbial population by affecting the fractionation of organic carbon removal between the aerobic and the anoxic zones. In order to improve sludge settling characteristics, the aerobic volume fraction and the recycle rate should be carefully selected, based on the influent chemical oxygen demand/ammonia ratio. SIPHONING SLUDGE.
Houston Dept. of Public Works, TX. Wastewater Div.
V. Bahl, and J. L. Geibel.
Civil Engineering (ASCE) CEWRA9, Vol. 60, No. 9, p 70-71, September 1990.

Descriptors: *Civil engineering, *Siphons, *Sludge, *Wastewater facilities, *Wastewater management, Ammonia, Biological oxygen demand, Clarification, Clarifiers, Nitrogen, Scum, Suspended solids, Texas, Water quality standards.

A massive wastewater treatment expansion using automatic sludge collection systems is helping Houston grow again. Amid the boom years of the early 1970s, the city had to curtail development because of: insufficient growth of wastewater treatment systems. Numerous small wastewater treatment plants became overloaded as service areas grew. Beginning in 1974, Houston set out to enlarge or upgrade 30 treatment plants, as well as to construct several new facilities for a 700 sq mi catchment area. Efficient removal of scum and floating debris became a major consideration when planning and designing new and upgraded facilities. Floating siphon sludge collection systems met the need. Floating siphon clarifiers were used at the Keegans Bayou Wastewater Treatment plant and at an addition to the Sims Bayou Wastewater Treatment plant. At the Metro Central Wastewater Treatment plant, floating siphon systems were installed in two final clarifiers as part of an expansion project. Keegans Bayou, Sims Bayou, and Metro Central plants now typically treat wastewater that averages 200 mg/L of biological oxygen demand (BOD) and has similar levels of total suspended solids (TSS). Ammonia as nitrogen averages 15 mg/L and organic nitrogen averages 9 mg/L. Aided by the automatic sludge collection systems the three plants consistently produce treated effluent that falls well below the permissible 30-day average of 10 mg/L BOD and 15 mg/L TSS. Ammonia nitrogen levels also fall below the permissible average of 3 mg/L in summer and 5 mg/L in winter. Houston abandoned many small wastewater treatment plants. Several lift stations were built to direct flows to the new regional facilities. (Fish-PTT)

GROUTING SLIP LINERS: THE NEW INSIDE STORY.
Halliburton Services, Houston, TX.
L. Lee.
Civil Engineering (ASCE) CEWRA9, Vol. 60, No. 9, p 78-80, September 1990. 1 fig.

Descriptors: *Civil engineering, *Grouting, *Liners, *Maintenance, *Pipes, *Sewer systems, *Sewers, Bulkheads, Collapse, Corrosion, Design standards, Flotation, Flow system, Industrial wastewater, Materials engineering, Pipe flow, Storm drains.

One cost-effective method of repairing storm drains, industrial drains, and sanitary sewers is slip lining: slipping a new pipe inside an old one and grouting it into place. It saves time and money, and lessens repair work. Large-diameter pipe is usually slip lined with jointed pipe pushed into the old pipe; small-diameter pipe is usually slip lined with continuous pipe pushed or pulled into place. Grouting prevents a failed installation in four ways: providing support for the pipe, slowing corrosion of the existing pipe, blocking the flow of water through the annular space, and preventing long-term damage or collapse of the new liner pipe. Factors affecting the grouting operation include water in the annular space, pipeline access, profile of the existing pipe, flotation effects, the volume of grout required, and the initial cause for pipe failure. The safest method for horizontal pipe is circulation grouting, which consists of pouring grout into one end of the system and tapping off the water and air at the opposite end. Stage grouting with controlled flotation is the best method for large-diameter thin-walled pipe. The best grouting material should have low viscosity, a clean interface with water, low specific gravity, low heat of hydration, and must not segregate when poured through water. Pumping time should be long and the grout should be impermeable and continuously-mixed. The planning and design stages should include a safe external pressure limit for the pipe; bulkhead design, venting requirements, placement and number of stages; profile and map of existing line showing all surface obstructions, elevations, and pipe-run footages; and number of stages for the grouting operation. INDUSTRIAL PRETREATMENT: COOPERATION--TO A POINT...
Metropolitan Waste Control Commission, St. Paul, MN.
L. H. Hermes, and J. D. Syme.
Water Engineering and Management WENMD2, Vol. 137, No. 8, p 40-41, August 1990. 3 fig.

Descriptors: *Compliance, *Industrial wastewater, *Metropolitan water management, *Pretreatment of wastewater, *Wastewater facilities, *Wastewater management, Industrial plants, Industrial wastes, Legal aspects, Metal-finishing wastes, Minnesota, Waste recovery, Water quality standards.

A major goal of industrial waste management is to discharge cleaner water. At the very least that means strict monitoring and enforcement. Strict enforcement of pretreatment requirements has proven to be the most effective route to a cleaner waste stream for the Industrial Waste Division of the Metropolitan Waste Control Commission, St. Paul, Minnesota, the regional wastewater treatment authority for the St. Paul-Minneapolis metropolitan area. The Commission has never been in court to battle an industrial waste violator. The use of stipulation agreements has proven to be a more effective and quicker remedy. A stipulation agreement is a legal contract entered into by the Commission and the violating industrial user, specifying the actions which will be taken to achieve compliance, and including a compliance schedule. Part of the success of industrial pretreatment efforts in the Twin Cities is due to the success of a privately-owned centralized treatment and recovery facility. Wastes handled at the facility are generated mainly by metal-plating shops and electronics manufacturing. Industrial waste control is a major issue for the 1990s. The Commission is currently preparing revisions to its waste discharge rules, and additional limits for toxic organics may be added in the future. (Fish-PTT)

START-UP OF LOW TEMPERATURE ANAEROBIC REACTORS USING FRESHWATER METHANOGENIC SEDIMENTS.
Universidad Autonoma de Barcelona (Spain). Unidad de Ingenieria Quimica.
A. Bardulet, J. Cairo, and J. M. Paris.
Environmental Technology ETLEDB, Vol. 11, No. 7, p 619-624, 1990. 3 fig, 1 tab, 19 ref. Commission of the European Communities Contract Nr. EN3B-0050-E(B).

Descriptors: *Anaerobic digestion, *Biogas, *Methanogenesis, *Sludge, *Wastewater treatment, Biological wastewater treatment, Fluvial sediments, Sludge digestion, Spain, Substrates.

Currently anaerobic digestion processes are mainly operated at the mesophilic range of temperatures. However, recently attention has been paid to the study of low temperature anaerobic digestion, which might serve as a method for energy recovery from organic wastes. Biogas production has been observed in lake sediments, wetlands, and marshes at temperatures between 4 and 15 C. Some methanogenic species, with low optimal temperatures have been isolated from sea and lake sediments. There is ongoing research to identify and characterize methanogenic flora which develops in low-temperature environments that might be utilized as inocula. The objective of this project was to start up anaerobic digesters, at 20 C, with non-conventional inocula (fresh water sediments) to assess the feasibility of utilizing such inocula to aerobically treat different wastewaters. This process appeared to be stable for the three substrates studied; pig manure, distillery waste and sewage sludge. The total solids concentrations for the three substrates were 40, 25, and 32 kg/cubic m respectively. The range of organic load applied was 0.1-1.3 kg COD/cubic m/day. Biogas production ranged from 0.195 to 0.257 cubic m biogas/kg substrate/day, and the percentage of methane ranged from 66 to 76%. The results of this work indicate that fresh water sediments are a promising alternative to conventional anaerobic sludge for inoculating low temperature anaerobic digesters. (Korn-PTT)

Descriptors: *Nutrient concentrations, *Rainfall-runoff relationships, *Urban runoff, *Wastewater treatment facilities, Biological wastewater treatment, Canada, Flow characteristics, Literature review, Rainfall, Runoff, Wastewater, Wastewater treatment.

During rain events, run-off waters from urban areas are carried by combined sewer systems toward wastewater treatment facilities. The characteristics of these waters are different from those of usual wastewaters especially concerning flow. A sampling program and knowledge found in literature review lead to the conclusion that variations in flow and concentrations of nutrients measured during the sampling period did not cause any important changes in the operation of a biological wastewater treatment system. Extensive research has been conducted on anaerobic-aerobic activated sludge systems in recent years in an attempt to increase their capacity for phosphate removal from wastewater. The enhanced phosphate removal is possibly attributable to the presence of certain bacteria capable of polyphosphate accumulation under aerobic conditions. Polyphosphate stored in bacterial cells is then hydrolyzed under anaerobic conditions to provide bacteria with the energy needed for an anaerobic substrate uptake. Two laboratory anaerobic-aerobic activated sludge reactors were operated to study enhanced biological phosphate removal. They differed only in organic substrate composition. Reactor F was fed with acetate, reactor G with an acetate-glucose mixture. Both reactors were started with identical activated sludge which had an enhanced biological phosphate removal ability. During the adaptation period, this ability increased several fold in reactor F but it was completely lost in reactor G. In spite of this fact, organic substrate also disappeared from the solution during the anaerobic stage in reactor G. Interferences due to electron acceptors such as dissolved oxygen, nitrates, nitrites, and sulfates were too low to explain this phenomenon. (Author's abstract)

Chromate is one of the toxic heavy metals which are common pollutants and has been shown to be mutagenic in a number of bacterial systems. Wastewaters containing toxic chromate are generated in many industrial processes. Hexavalent chromium is very soluble in water and forms the divalent anions chromate and dichromate. Detoxification and removal of hexavalent chromium in an industrial effluent was investigated using Enterobacter cloacae. This bacterium could completely reduce chromate to less toxic trivalent chromium when appropriate nutrients were supplied to the effluent. The reduction rate was strongly dependent on the amount of added carbon and energy sources, and also on cell density. Since the reduced chromium readily formed insoluble chromium hydroxides, about 40% of the reduced chromium could be removed from the treated water by centrifugation. The important features of the bacterial reduction of toxic chromate were as follows: (1) the reduction occurred only under anaerobic conditions, (2) carbon and energy sources were required not only for the bacterial growth, but also for the reduction of chromate, (3) the reduction occurred at a neutral pH and at normal temperatures of 20-40 C, (4) the rates of reduction were proportional to cell number, and (5) the chromate reduction was inhibited to some extent by metal ions including Cu(2+), Mn(2+), and Zn(2+). DESIGN CONSIDERATIONS FOR WASTE WATER TREATMENT WITH WATER HYACINTH E. CRASSIPES.
Universidad Autonoma Metropolitana, Mexico City. Dept. de Biotecnologia.
O. M. Hermosillo, and S. Sarquis.
Environmental Technology ETLEDB, Vol. 11, No. 7, p 669-674, 1990. 5 fig, 3 tab, 15 ref.

Descriptors: *Wastewater treatment, *Wastewater treatment facilities, *Water hyacinth, Biochemical oxygen demand, Design criteria, Maturation ponds, Mexico, Nutrients, Toxic wastes.

The use of the water hyacinth for the removal of nutrients, biochemical oxygen demand (BOD) and toxic substances has been practiced at pilot and full scale levels by many researchers. This study was conducted to provide a design methodology for wastewater treatment in water hyacinth ponds. In order to efficiently use water hyacinth ponds for nutrient removal they must be designed as maturation ponds according to the existing local conditions, which implies that secondary treatment is needed prior to the water hyacinth pond. Satisfactory removal efficiencies can be obtained by decreasing the nitrogen load input to the system. This requires a larger pond area that causes increased biomass harvesting and disposal problems. The water-hyacinth density also plays an important role. The plant must be harvested periodically to keep the population between 80 and 120 T/Ha/d which results in the optimum growth rate. Literature data was compiled with growth rate and yield measurements to develop a performance equation with two dimensionless groups indicating the system capacity for nutrient removal. It was concluded that organic loads up to 10 Kg BOD/Ha/d are critical to obtain nitrogen removal efficiencies greater than 80%. (Korn-PTT)

MICROBIOLOGY OF FOAMING IN ACTIVATED SLUDGE PLANTS.
Bendigo Coll. of Advanced Education (Australia). Dept. of Biological and Chemical Sciences.
J. A. Soddell, and R. J. Seviour.
Journal of Applied Bacteriology JABAA4, Vol. 69, No. 2, p 145-176, August 1990. 8 fig, 2 tab, 227 ref.

Descriptors: *Activated sludge, *Activated sludge process, *Bacteria, *Bulking sludge, *Flocculation, *Foaming, *Fungi, *Microbiology, *Microorganisms, *Wastewater treatment, Actinomyces, Australia, Bacterial analysis, Bacterial biochemistry, Bacterial ecology, Bacterial physiology, Biological treatment, Microthrix, Nostoc, Sphaerotilus, Wastewater facilities.

One of the most common forms of biological treatment of sewage is the activated sludge process which is a two stage process consisting of initial aeration followed by sedimentation. An essential requirement for successful operation of a sewage treatment plant is the formation of a suitable microbe-containing floc in the aeration tank, that

LIBRARY U. OF I. URBANA-CHAMPAIGN

produces a clear supernatant. Foaming involves filamentous bacteria and manifests itself as a persistent viscous brown foam or scum on the surface of the mixed liquor in the aeration vessel and sometimes on the secondary clarifier. The formation of this foam prevents the proper settling of solids that is essential to the activated-sludge process. Microscopic examination of foam usually reveals a large number of branching filamentous of actinomycetes, although filamentous bacteria and even non-filamentous bacteria have been reported. Other filamentous bacteria include Microthrix parvicella which selectively accumulates in the foam. Other organisms reported as major constituents of foam include Eikelboom Type 1851, Type 0581, Type 0914, Sphaerotilus and Nostocoida limicola. This review indicates that more studies to understand the ecology, physiology and biochemistry of the organisms in the foam are needed, and micromanipulation techniques must be used to isolate them. New specific identification techniques like DNA probes need to be developed and routinely applied to follow populations of foam causing organisms in selected treatment plants before, during, and after foaming episodes, so that changes in their levels can be detected and followed. Finally, a more complete understanding of the biological basis of foaming in activated sludge is needed. (Korn-PTT)

COMPOST ODOR CONTROL THROUGH PROCESS OPTIMIZATION.
Claremont City Water/Sewer Div., NH.
M. E. Lang, B. M. Bennett, and R. A. Jager.
Biocycle BCYCDK, Vol. 31, No. 7, p 76-78, July 1990. 1 fig, 4 ref.

Descriptors: *Composting, *Odor control, *Sludge disposal, *Wastewater treatment.

The Claremont, New Hampshire Wastewater Treatment Facility is a four million gallon per day conventional activated sludge facility, using aerated static pile composting of raw sludge and distribution as the method of sludge management. Numerous odor complaints were received from neighbors of the composting facility. The sludge contained high total and volatile solids, partially due to waste generated from paper processing industries. In aerated static pile composting, a minimum total solids concentration of 40% is important to provide porosity and structural integrity. At the Claremont Facility, the amendment to sludge ratio was approximately 2.7 to 1 and 0.8 to 1 on a volumetric and weight basis respectively. The aeration system was designed so that each blower operated in a positive and negative mode. It was recommended that the system run in the negative mode until the temperature within the compost pile was between 55 and 65 C. Then the air flow was reversed to control temperature while optimizing stabilization and drying. The dewatering schedule and pile construction sequence were modified to insure that aeration was provided to the same day's mix. The active piles were broken down and restacked to stimulate further stabilization. No odor complaints were received in the two months following these modifications. Further planned improvements include the construction of a collection duct and biofilter to treat process air from blowers operating in the negative mode, and the use of bio-ash as an amendment within the composting process. BOROUGH OF HUNTINGDON UPGRADES ITS WASTEWATER TREATMENT FACILITIES.
Commonwealth Engineering and Technology, Inc., Harrisburg, PA.
R. H. Myers, and J. H. Parks.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 4, p 23-27, July/August 1990. 2 fig, 3 tab.

Descriptors: *Filtration, *Wastewater facilities, *Wastewater treatment, Clarigestion, Compliance, Filters, Huntingdon, Juniata River, Pennsylvania, Wetlands.

The Borough of Huntingdon, PA's population growth required increased public service facilities. A 3.75 MGD wastewater treatment facility was recommended. The facility consists of preliminary treatment in the form of screening and grit removal, raw wastewater pumping and distribution, primary treatment by existing clarigestion, trickling filtration, final clarification and disinfection by chlorination prior to discharge. Sludge processing consists of anaerobic digestion of primary sludge by clarigestion, gravity thickening of trickling filter sludge, lime stabilization of thickened sludge and sludge storage. Liquid sludge was hauled to approved farmland for disposal. The Borough successfully handled a design problem involving an adjacent wetlands area with the aid of the U.S. Army Corp of Engineers. Start-up commenced in June, 1988 and final effluent compliance was achieved in less than five days. The Borough was able to meet the compliance schedule and provide facilities which contribute to improving the quality of the Juniata River. (Miller-PTT)

EXPANSION AND UPGRADING OF THE CHALFONT-NEW BRITAIN TOWNSHIP JOINT SEWAGE AUTHORITY/BUCKS COUNTY WATER AND SEWER AUTHORITY WASTEWATER TREATMENT PLANT.
Chalfont-New Britian Township Joint Sewage Authority, PA.
R. L. Truman, and L. E. Ritter.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 4, p 31-40, July/August 1990. 4 tab.

Descriptors: *Secondary wastewater treatment, *Wastewater facilities, *Wastewater treatment, Chalfont, Compliance, New Britain, Pennsylvania, Phosphate removal, Sludge treatment, Storm wastewater.

The secondary treatment plant of the Chalfont-New Britain Township Joint Sewage Authority became a regional plant when its capacity was doubled to 1.4 MGD in 1969. A 201 Facility Plan was prepared for the Authorities in 1981. Construction began in April, 1987. The Department of Environmental Resources required that secondary treatment remain in full operation during construction. The system was ready for operation by October, 1988. Sludge handling facilities included two-stage anaerobic digestion, dissolved air flotation thickening of excess activated sludge and dewatering by two belt filter presses. Biological phosphorus removal occurs in the system as the wastewater passes alternately through aerobic and anaerobic zones of the outer channel through 'luxury' phosphorus uptake. A very important special feature of the concentric channel system has been its ability to accept peak flows well beyond capacity during storm events while maintaining a high degree of operating efficiency. The Authority looks forward to producing a high quality effluent with relative ease after struggling to achieve permit compliance during the startup period. (Miller-PTT)

MEASUREMENT OF SURFACE TENSION IN AGRICULTURAL WASTE SLURRIES.
Cambridge Univ. (England). Dept. of Chemical Engineering.
K. W. Hester, K. Niranjan, and J. F. Davidson.
Journal of Agricultural Engineering Research JAERA2, Vol. 46, No. 2, p 147-152, June 1990. 3 fig, 7 ref.

Descriptors: *Data interpretation, *Farm wastes, *Surface tension, *Waste treatment, *Wastewater treatment, Mathematical equations, Slurries, Solids, Viscosity, Wastewater.

An experimental method to determine the equilibrium surface tension of cattle and pig slurries are described. The surface tension was determined by using a published modification of the 'maximum bubble pressure method': the pressure inside a spherical bubble in excess of its surrounding is measured just prior to its release into a slurry through a capillary; the surface tension is calculated using $P = 2$ (surface tension)/radius of the curvature, where P is the maximum pressure. The method was found to be valid only at slurry solid concentrations of $< 6\%$ by weight, where measurement errors due to slurry viscosity and the influence of solids were insignificant. Slurry surface tension was found to be 0.06 to 0.07 N/m, only slightly lower than water. This method may be applied to other agricultural waste slurries, fermentation broths and domestic sewage. GROWTH AND VALUE OF CHLORELLA SALINA GROWN ON HIGHLY SALINE SEWAGE EFFLUENT.
Chinese Univ. of Hong Kong, Shatin. Dept. of Biology.
P. K. Wong, and K. Y. Chan.
Agriculture, Ecosystems and Environment AEENDO, Vol. 30, No. 3/4, p 235-250, April 1990. 10 tab, 46 ref.

Descriptors: *Chlorella, *Chlorophyta, *Effluents, *Fish food, *Nutrient removal, *Saline water, *Tertiary wastewater treatment, *Wastewater, *Wastewater treatment, Algae, Amino acids, Biomass, Fish, Nitrogen, Phosphorus, Phosphorus removal, Secondary wastewater treatment.

Chlorella salina was successfully cultivated in secondarily treated domestic sewage effluent of high salinity (14 ppt) in an outdoor cultivation tank. Removal efficiencies of NH4(+)-N, NO3(-)-N, and PO4(3-)-P by this alga from secondarily treated sewage effluent were 89-100%, 35-66% and 100% respectively. The high removal efficiencies of inorganic N and P means that this process can be used as a tertiary treatment. The yield of the sewage grown algae was 5.1 g/sq m/day for a retention time of six days. The high protein content (46.8%), relatively good amino-acid profile and low metal content enabled the use of algal biomass as feed supplement for the silver carp (Hypophthalmichthys molitrix). The food conversion ratio (FCR) of 5% and 10% sewage-grown algae supplemented fish food were better than on the control diet (i.e. artificial fish food alone), while the FCR of 20% sewage-grown algae supplemented fish food and live sewage-grown algae alone were inferior to that on the control diet. These results indicate that cultivation of C. salina in secondarily treated sewage effluent of high salinity can be used as a tertiary sewage treatment to remove inorganic N and P from secondarily treated sewage effluent to reduce pollution problems and to produce algal protein suitable as a supplement for fish feed in aquaculture. CONVERSION OF FAT INTO YEAST BIOMASS IN PROTEIN-CONTAINING WASTE WATER.
Lund Univ. (Sweden). Dept. of Applied Microbiology.
S. Rydin, G. Molin, and I. Nilsson.
Applied Microbiology and Biotechnology AMBIDG, Vol. 33, No. 4, p 473-476, July 1990. 1 fig, 3 tab, 15 ref.

Descriptors: *Biomass, *Fats, *Proteins, *Wastewater treatment, *Yeasts, Culture techniques, Fungi, Lipids, Methane, Methanogenesis, Sedimentation, Wastewater utilization.

Candida tropicalis S001 was grown on the lipid fraction of a protein-containing wastewater in order to (i) remove fat from the water, and (ii) produce yeast biomass for feed. The yeast cells were separated from the wastewater by sedimentation. Defatted wastewater was used for methane production and gave a yield of 0.3 cubic meter methane/kg reduced chemical oxygen demand. The maximum specific growth rate of C. tropicali

growing on wastewater fat at pH 4.0 was 0.35/h; the fat content was decreased from 8 g/L to about 0.1 g/L within 24 h. In continuous culture a corresponding reduction was maintained at dilution rates up to 0.36/h. The effect on growth of pH, temperature, and CO2 concentration was studied with triolein as the major carbon source. The maximum specific growth rate was nearly constant (0.16/h) in the pH and temperature range of 3.2-4.0 and 20-38 C, respectively; 10% CO2 was optimal for growth. Growth on triolein resulted in a biomass yield of 0.70 g dry weight/g fat. (Author's abstract)

ITY TACKLES MAJOR SANITARY SEWER EHABILITATION WITH NEW PROCESS.
. K. Murzyn.
ublic Works PUWOAH Vol. 21, No. 9, p 62-63, ugust 1990.

escriptors: *Engineering, *Rehabilitation, Sewer systems, Cost analysis, Illinois, Polyethylne, Swagelining.

he rehabilitation of the sanitary sewer system, me portions of which were in excess of 75 years d, of the city of Wheaton, Illinois is described. rge sections of the pipelines has deteriorated ructurally, and inflow and infiltration problems ere common in older, more established sewer erals and mains. To find a long term solution to e problem, the city considered three basic alterives: open cut excavation and replacement of teriorating pipe sections; a felt lining and epoxy in system; and Swagelining, the polyethylene er pipe process. The process ultimately selected s Swagelining, which is new and unproven for itary sewer applications. The process involves e insertion of polyethylene pipe inside existing ver pipe to provide a tight fitting structural ng. While the costs for using Swagelining were ver than those of other methods, there were er advantages to the process, among them: (1) use of polyethylene pipe is accepted by the nois EPA, (2) the pipe meets ASTM standards, ich means that it has known, predictable engiring properties, (3) the insertion of the liner e actually increases the flow capacity of the tem (by 20%), because the coefficient of friction he polyethylene pipe is much lower than that of original clay and concrete sections. Swagelinaccounted for rehabilitating 15,000 lineal feet ewer lines at a cost estimated at 40 percent less n traditional open cut methods in roughly half time (5 months). Although the process had n previously untried in sanitary sewer applicas, it has proven highly effective in Wheaton. ostine-PTT)

anaerobic bacterial consortium was shown to oxylate phenol to benzoate under methano- conditions. Benzoate accumulated in the cul- medium and was completely degraded when the incubation period was prolonged. Two potential intermediates of phenol metabolism, namely cyclohexanol and cyclohexanone, were not accumulated or transformed by the consortium. Proteose peptone must be added to the culture medium for the carboxylation of phenol to occur and glucose could not replace proteose peptone. Inhibition of methanogenesis did not affect the carboxylation of phenol and the presence or absence of hydrogen in the gaseous atmosphere did not prevent the accumulation of benzoate. The consortium was composed of various microbiological forms dominated by Gram-negative rods. Phenol-carboxylating microorganisms were evaluated to about > or = 100 million cells/ml by using diluted inocula. These results suggest that the carboxylation of phenol is accomplished by co-metabolism and that proteose peptone or some degradation products serve as carbon and energy sources for the growth of the carboxylating bacteria, which appear to be present in large numbers in the consortium. TENTATIVE IDENTIFICATION OF ORGANIC COMPOUNDS AT THE WESTSIDE WASTEWATER TREATMENT PLANT (HIGH POINT, NC) AND IMPLICATIONS FOR AQUATIC TOXICITY.
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
F. A. DiGiano, R. F. Christman, and J. F. Storm.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-185869/AS. Price codes: A06 in paper copy, A01 in microfiche. North Carolina Water Resources Research Institute, Raleigh, Completion Report No. 245, (UNC-WRRI-89-245), July 1989. 103p, 3 fig, 21 tab, 75 ref, 8 append. State Project 70062.

Descriptors: *Organic compounds, *Pollutant identification, *Wastewater treatment, Biomonitoring, North Carolina, Toxicity.

After identifying an acute toxicity problem, the North Carolina Division of Environmental Management required the High Point Westside Wastewater Treatment Plant (Westside WWTP) to institute periodic biomonitoring and reduce whole effluent toxicity. This research was undertaken to provide additional information through a broad spectrum, chemical-specific approach to toxicity reduction in which potential toxicants are identified. Westside WWTP samples determined as acutely 'toxic' or 'non-toxic' by Daphnia pulex bioassay, effluents from six categories of industrial dischargers, and a domestic wastewater sample were analyzed for organic chemicals using continuous solvent extraction of wastewater samples and broad spectrum GC/MS analysis. An extensive data base was developed which includes aquatic toxicity data for 60 compounds and tentatively identified compounds in WWTP samples (82 out 123 peaks were identified) and industrial effluents (about 50 for each) ranked according to their potential for contribution to toxicity. The study suggests that many compounds found in Westside WWTP influent and effluent are of industrial origin because they occur in both industrial samples and Westside WWTP samples. (USGS)

Descriptors: *Eutrophication, *Sewer systems, *Wastewater collection, Eutrophic lakes, Glacial lakes, Lake Madison, Nutrients, South Dakota, Water analysis, Water quality.

From 1968-75 extensive studies supported by EPA and OWRR were done to determine the rate and extent of the aging process in Lake Madison, a 300-acre shallow glacial prairie lake surrounded by about 600 homes near Madison, South Dakota. Since then several specific things have been done to try to slow the eutrophication of the lake. In 1970 a Sanitary District was established, and this led to most of the homes around the lake installing septic tanks and disposal fields. In 1986 the sewage treatment plant for the City of Madison was totally replaced and an extensive tertiary treatment was implemented. Sewage effluent from the city is now sent to four infiltration, percolation ponds. A sewage collection system for all the homes around Lake Madison was initiated in 1987 and scheduled for completion in 1988. In order to compile a profile of selected water quality parameters in Lake Madison, Dakota State University conducted water analysis studies in Lake Madison in the summer of 1987 and also included extensive studies of Silver Creek, the main feeder stream for Lake Madison. This research was continued and expanded in the summer of 1988 through a WRI grant. The primary objectives of this research were to continue to develop base-line data prior to and during the first year that the sewage collection system is on-line, to compare collected data to the data assembled in 1969-70, and to expand and test the college's capabilities for monitoring selected water quality parameters. Descriptors: *Biodegradation, *Biological wastewater treatment, *Pentachlorophenol, *Wastewater treatment, Alginate, Flavobacterium, Microbial degradation, Phenols, Polyurethane.

A pentachlorophenol (PCP)-degrading Flavobacterium, a p-cresol-degrading Pseudomonas, and the lignin-degrading P. chrysosporium were all effectively immobilized in both alginate and polyurethane. The immobilized cells effectively degraded their target compounds, and the systems proved amenable to use in batch or fluidized bed reactors for degrading PCP or cresol contaminated water and soil. Polyurethane appears to be the immobilization matrix of choice for field application as it: (1) is mechanically strong; (2) stabilizes cells for long half-lives; (3) protects cells from pollutant toxicities; and (4) in the case of PCP, acts to adsorb the contaminant and localize it in the support. Electron microscopy showed that cells were likely entrapped in small pores in the foam as opposed to being covalently linked to it. A field laboratory was assembled at a wood treating site and a 40 liter fluidized bed reactor containing foam-immobilized Flavobacterium was operated for a four week trial. The system achieved approximately 75% removal of PCP with a residence time of 0.5 hours, and approximately 90% removal with a residence time of 0.8 hours. It was determined that PCP activity in the field was due to the inoculated Flavobacterium rather than indigenous organisms growing on the outside of the foam particles. (USGS)

treatment, *Solids, *Waste disposal, *Waste treatment, Mass spectrometry, Wastewater treatment.

Significant progress has been made in the field of fluidization in recent years due to its application to the combustion of coal, sewage sludges, and other residues. These new applications have created a demand for new measuring techniques. Currently available measuring techniques for fluid mechanical properties are reviewed, ranging from simple measurements for the determination of bed expansion, to more sophisticated techniques for the determination of local solids concentrations, velocities and mass flows. Furthermore, the problem of gas sampling from fluidized bed reactors is discussed. Among others, a measuring technique based on mass spectrometry is presented for the local and instantaneous measurement of gas concentrations. (Author's abstract)

COMPREHENSIVE HEALTH EFFECTS TESTING PROGRAM FOR DENVER'S POTABLE WATER REUSE DEMONSTRATION PROJECT.
Denver Water Dept., CO.
W. C. Lauer, F. J. Johns, G. W. Wolfe, B. A. Myers, and L. Y. Condie.
Journal of Toxicology and Environmental Health JTEHD6, Vol. 30, No. 4, p 305-321, August 1990. 1 fig, 2 tab, 33 ref. EPA Contract CS-806821.

Descriptors: *Denver, *Drinking water, *Potable water, *Public health, *Wastewater renovation, *Wastewater treatment, *Water reuse, *Water treatment, Biological studies, Clarification, Colorado, Filtration, Performance evaluation, Reverse osmosis, Secondary wastewater, Toxicity, Toxicology.

A project was designed to evaluate the relative health effects of highly treated reclaimed water derived from secondary wastewater compared to Denver's present high-quality drinking water. The 1 million gallon per day (1 mgd) demonstration plant provides water to be evaluated in the studies treating unchlorinated secondary treated wastewater with the following additional processes: high pH lime clarification, recarbonation, filtration, ultraviolet irradiation, activated carbon adsorption, reverse osmosis, air stripping, ozonation and chloramination. An additional sample is obtained from the identical treatment process substituting ultrafiltration for reverse osmosis. The toxicology tests to evaluate the possible long-term health effects are chronic toxicity and oncogenicity studies in Fischer 344 rats and B6C3F1 mice and reproductive/teratology in Sprague-Dawley rats. The results of these evaluations will be correlated with microbiological, chemical, and physical test results to establish the relative quality of reclaimed water compared to all established health standards as well as Denver's pristine drinking water. MINIMIZATION OF CHROMIUM-CONTAMINATED WASTEWATER AT A PLATING FACILITY IN THE EASTERN UNITED STATES.
Oak Ridge National Lab., TN. Chemical Technology Div.
J. F. Walker, J. H. Wilson, and C. H. Brown.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 156-160, August 1990. 8 fig, 3 tab, 1 ref.

Descriptors: *Chromium, *Industrial wastewater, *Metal-finishing wastes, *Reverse osmosis, *Wastewater treatment, *Water pollution control, Pretreatment of wastewater, Water pollution treatment.

The Oak Ridge National Laboratory conducted a hazardous waste minimization program at an industrial plating facility located in the Eastern United States. Investigations at the facility indicated that chromium was the major source of contamination. Several improvements in the operation of the facility were implemented which reduced the quantity of chromium lost from the facility by 85%. The remaining chromium-contaminated wastewater streams were treated by reverse osmosis (RO) followed by evaporation of the RO concentrate for further volume reduction. Pilot-scale RO tests indicated that the gun line rinse waters could be successfully treated by RO using a 1 to 5 micron prefilter. Pretreatment of the bright-dip rinse water proved to be ineffective; however, cleaning the membrane with a 1% solution of EDTA allowed the use of RO treatment of the bright-dip rinse by oversizing the RO unit to take into account the expected loss in permeate flux. In the full-scale tests, the loss of permeate flux was restored by cleaning with a mixture of phosphoric acid. (Geiger-PTT)

BIODEGRADATION OF CHLORINATED HYDROCARBONS IN AN IMMOBILIZED BED REACTOR.
Louisiana State Univ., Baton Rouge. Inst. for Environmental Studies.
G. P. Miller, R. J. Portier, D. G. Hoover, D. D. Friday, and J. L. Sicand.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 161-164, August 1990. 7 fig, 1 tab, 10 ref.

Descriptors: *Biodegradation, *Biological treatment, *Chlorinated hydrocarbons, *Groundwater pollution, *Immobilized bed reactors, *Wastewater treatment, *Water pollution treatment, Bacteria, Mineralization, Organic solvents.

A 75 liter immobilized microbe biological reactor with a bed retention time of 20.5 hr was used in a continuous flow mode to remediate contaminated groundwater containing ethylene dichloride (EDC), tetrachloroethylene, and trichloroethylene (TCE), with EDC being the predominant contaminant. The reactor was initially seeded with Xanthobacter autotrophicus, a demonstrated halogenated aliphatic substrate utilizer. The reactor was operated for forty-two days. Material balance determinations for primary volatile aliphatics of concern indicated an average of 90.2% mineralization of EDC, 81.7% of the TCE and 64.0% of the tetrachloroethylene. In addition to X. autotrophicus, four indigenous bacterial species from the groundwater had successfully acclimated to the reactor bed. Of the five effluent isolates only two have been identified. These are X. autotrophicus and Comamonas acidovorans. (Author's abstract)

INNOVATIVE MANAGEMENT OF AN AERATED/FACULTATIVE LAGOON SUSPENDED-GROWTH BIOLOGICAL TREATMENT SYSTEM FOR HIGH STRENGTH INDUSTRIAL WASTE STABILIZATION.
Metropolitan Denver Sewage Disposal District No. 1, CO.
T. J. Muirhead.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 174-182, August 1990. 10 fig, 6 tab, 13 ref.

Descriptors: *Biological wastewater treatment, *Industrial wastes, *Stabilization lagoons, *Waste stabilization, *Wastewater treatment, Aerated lagoons, Aeration, Food-processing wastes, Wastewater lagoons.

The performance and kinetics of the Coors Bio-Tech aerated/facultative lagoon suspended-growth biological treatment system were examined for high strength industrial waste stabilization. The lagoon was operated in various treatment modes and over a range of organic loadings and influent wastes to demonstrate its performance capabilities for high strength industrial waste stabilization. Process stream flexibility, large reactor volume, adequate aeration, sufficient nutrients, long mean cell residence time, high buffering capacity, and healthy-recalcitrant microbial biomass significantly contribute to its excellent efficiency in high strength industrial waste stabilization. The stabilization process was described by a dynamic, high-order removal rate mathematical model. The aerated lagoon maintained a continuous mode of readiness to assimilate varying loads of high strength organic wastes and varying loads of biochemical oxygen demand. Lagoon efficiency was highest when anaerobic conditions existed and slightly less under aerobic conditions. Peak performance was established at a continuous daily loading rate of approximately 4.4 kg/cu m. As organic loadings were increased, the process reached an optimum level of removal as seen in the plateau for removal rates above 8.4 kg/cu m. A simulated clarification evaluation through the use of a settleometer showed an average high suspended solids removal rate. Despite lagoon sludge settleability rates characteristic of bulking sludge conditions, excellent solids compaction and filterability properties were observed. Microbiological studies showed a stable, healthy, recalcitrant microbial biomass comprised of a well-balanced population of bacteria, fungi, protozoa, rotifers and filaments. The microbial biomass was resistive to toxicity from acute loadings of highly concentrated wastes of ammonia, sulfides, acids, caustic, and biocides. (Geiger-PTT)

REMOVAL OF ORGANICS FROM OFFSHORE PRODUCED WATERS USING NANOFILTRATION MEMBRANE TECHNOLOGY.
Texaco, Inc., Beacon, NY.
C. A. Dyke, and C. R. Bartels.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 183-186, August 1990. 7 fig, 1 ref.

Descriptors: *Membrane processes, *Offshore platforms, *Organic pollutants, *Ultrafiltration, *Wastewater treatment, Cleanup procedures, Oil industry, Oil pollution, Organic compounds, Pilot plants, Reverse osmosis.

A treatment process for offshore produced water that employs nanofiltration for the removal of organic pollutants was tested on offshore platforms. The membranes yielded a permeate for discharge of less than 48 mg/l freon-extractable organics at 50% recovery, while rejecting less than 20% of the NaCl when fed a produced water of up to 176 mg/L freon-extractable organics. For a standard 6.35 cm diameter by 1 meter long spiral-wound module, initial productivities at 25 C, 14.8 bar, 58,000 mg/L total dissolved solids, and 7% recovery can be expected to be as high as 1.2 cu m/day. Although more development work is needed for this application, nanofiltration membrane systems have the potential to replace flotation cells and/or carbon adsorbers on platforms where these are required. PRESSURE SEWERS DESIGN CONSIDERATIONS AND ANTICIPATED MAINTENANCE.
Hill (William F.) and Associates, Inc., Gettysburg PA.
W. F. Hill.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 5, p 20-24, September/October 1990.

Descriptors: *Design criteria, *Pressure sewers, *Sewer systems, *Wastewater collection, *Wastewater treatment, Maintenance, Pipelines, Rural areas, Septic tanks.

In rural communities with hilly terrain, pressure sewer collection and conveyance systems may be beneficial for wastewater collection. The Lake Heritage Municipal Authority and the Possum Valley Sewer Authority of Adams County, Pennsylvania are both served by pressure collection systems that are different with respect to operation and maintenance. Lake Heritage Municipal Authority uses grinder pump units and the Possum Valley Sewer Authority uses septic tank effluent pumping. Septic tank effluent pumping allows the basic form of primary treatment on the customer's property in that the solids are removed by flotation and sedimentation in a conventional septic tank then the septic tank effluent flows to a pump p

where the wastewater is pumped by a one horse-power centrifugal pump to the pressurized sewer system. Almost all centrifugal grinder units are two horsepower units. Velocities in the pressure sewer lines should not be less than two feet per second. The submersible pumps, float controls, and discharge piping are housed in a subsurface basin which is secured to mass concrete to prevent flotation. The recommended piping material for the pressure sewers is polyvinyl chloride SDR 21 type pipe with O-ring fittings. The piping system should be frost protected at all locations. Sufficient plug valves should be provided throughout the collection system to facilitate maintenance and system repair. In-line cleanouts should be provided every 600 ft to provide for periodic flushing of the system and specific maintenance procedures. Terminal cleanouts must be provided at ends of the pressure system. Most pumping units will require a 220 volt, single phase service to the pump unit control panel. Grinding units may be either centrifugal grinders or displacement grinders. Grease accumulations within the grinder units require constant maintenance. For septic tank effluent, periodic pumping will be required every three to four years. Corrosion problems are common in the septic tank effluent pump units, and can be reduced with the installation of a nyatron device at the base of the pedestal. Solid wastes that enter the impeller housing can cause pump failure. This problem can be alleviated by a solids retaining device. (Geiger-PTT)

APPLICATIONS OF ADVANCED MEMBRANE FILTRATION TO INDUSTRIAL WASTEWATER TREATMENT AND GROUNDWATER CLEAN-UP.
Resource Technologies Group, Inc., Morgantown, WV.
R. W. Tiepel, and J. Shorr.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 5, p 41-47, September/October 1990. 7 fig, 8 tab.

Descriptors: *Industrial wastewater, *Membrane filters, *Wastewater treatment, *Water pollution treatment, Chemical treatment, Fouling, Groundwater, Metal-finishing wastes, Mine wastes, Pretreatment of wastewater, Uranium.

Recent advances in membrane technology combined with innovative pretreatment techniques have enabled certain complex wastewaters to be effectively treated to required effluent standards. The membrane is made of an inert fluorocarbon-based material and is capable of withstanding pH conditions over the entire pH range of 0-14 and can hold up under severe oxidizing or reducing conditions. The advanced membrane system is designed to operate in turbulent flow to reduce fouling. Surface fouling by organics can be controlled with the addition of organic absorbent pretreatment chemicals such as powdered activated carbon or lime in the recirculating feed stream. The membranes can be cleaned with strong acids or bases or strong oxidants. Average pore sizes of 0.1 microns are used to overcome flux rate problems. Due to the relatively large pore size of the membrane, the system cannot reduce total dissolved solids and can be used in applications where only precipitated or sorbed pollutant species are removed. For removal of dissolved species such as chloride, sulfate, and sodium, a reverse osmosis, electrodialysis, or ion exchange system is required. Three key features of the system enable it to achieve successful treatment for a wide variety of applications: chemical pretreatment of the feed, membrane design, and system cleaning. The system has been applied to the treatment of electronics and metal-finishing industrial wastes, industrial laundry wastewater cleanup and recycling, groundwater cleanup and the Uranium Mill Tailings Remedial Action Program at the Canonsburg, Pennsylvania site. RECLAIMING REVERSE OSMOSIS BLOWDOWN WITH ELECTRODIALYSIS REVERSAL.
Ionics, Inc., Watertown, MA.
E. R. Reahl.
Desalination DSLNAH, Vol. 78, No. 1, p 77-89, July 1990. 5 fig, 5 tab, 3 ref, append.

Descriptors: *Desalination wastes, *Electrodialysis, *Industrial wastewater, *Reclaimed water, *Reverse osmosis, *Wastewater renovation, Brines, Desalination, Evaporation ponds, Feedwater treatment, Wastewater disposal.

The Electrodialysis Reversal (EDR) process is being used to reclaim waste concentrate from reverse osmosis (RO) systems for reuse as RO feedwater. The largest operating EDR-RO reclaim system is located at a major aerospace and electronics facility in the southwestern US. Design requirements and actual operation of the EDR system are discussed. The installation of EDR for reclaiming RO blowdowns, to reduce feedwater supply requirements to RO in water short areas, and EDR's reduction of waste brine volumes to evaporative ponding has been a success. The data, and the successful performance from this installation, has already generated additional applications for EDR concentration of RO blowdowns, with further inquiries on even newer potential installations. The EDR process has shown itself to be highly reliable. EDR is easy to operate, particularly with modifications made to the system for brine concentration applications. The process has not developed any intrinsic weakness in over 12,000 hours of operation at this site. (Author's abstract)

Descriptors: *Biological wastewater treatment, *Insect control, *Mosquitoes, *Sago pondweed, *Secondary wastewater treatment, *Wastewater lagoons, *Wastewater treatment, Aquatic insects, Biological treatment, Biomass, Fish food organisms, Guppies, Marsh management, Mosquitofish, Population density, Pupfish, Zooplankton.

Vascular aquatic plants can provide a remarkably efficient and inexpensive means of treating municipal, agricultural and industrial wastewater. Unfortunately, mosquito control is difficult in artificial marsh environments. The abilities of pupfish, mosquitofish and guppies to control mosquitoes in wastewater marshes was compared. Sago pondweed was planted in 210 liter fiberglass tanks through which secondary wastewater was passed at 4 to 6 ml/second. Groups of 10 to 30 fish were placed in each of 15 tanks (plus 5 controls), along with large mosquito egg rafts. All species of fish reduced mosquito emergence ($p < or = 0.05$). When fish population densities were similar, fish reduced emergence to similar levels. As experiments progressed, guppies developed greater population densities and provided better mosquito control than mosquitofish, which developed greater densities and better control than pupfish. Fish also reduced numbers of zooplankton, and guppies increased total plant biomass, suggesting fish may influence the ability of wastewater marshes to treat wastewater. (Author's abstract)

DESIGN AND CONSTRUCTION OF TREATMENT PROCESSES FOR HIGHWAY RUNOFF IN THE FRG.
Ingenieur-Dienst-Nord, Industriestrasse 32, 2806 Oyten, Germany.
G. Lange.
The Science of the Total Environment STENDL, Vol. 93, p 499-506, April 1990. 1 fig, 11 ref.

Descriptors: *Germany, *Highway effects, *Urban runoff, *Wastewater treatment, *Water pollution control, *Watercourses, Drainage systems, Pollutants, Project planning, Runoff, Surface runoff, Water pollution.

Highway runoff systems used to be designed on the basis of functional and economic considerations. Due to the introduction of the Guidelines for Street Construction (RAS-Ew) drainage guidelines in 1987 by the Transport Minister of the Federal Republic of Germany (FRG), these systems are now chosen on the basis of their effects on watercourses, groundwater and the environment. The different systems for collecting and draining highway runoff are evaluated on the basis of current knowledge. These systems include infiltration basins; footings and slopes; and infiltration ditches, shafts, and wells. The natural infiltration of road surface water over a wide area is a fundamental aim. Only when this proves impossible should runoff be discharged into watercourses. This solution includes retention systems and treatment plants. The discharge of highway runoff involves both a blockage-free drainage system and a removal system which does not harm the ground below. This latter protection must be permanently assured. It is therefore the task of the engineer to plan drainage installations in such a way that road safety requirements are permanently satisfied and no damage is caused at any subsequent stage in the drainage system. POLLUTANT REMOVAL BY GULLY POTS IN DIFFERENT CATCHMENT AREAS.
Hanover Univ. (Germany, F.R.). Inst. fuer Wasserwirtschaft, Hydrologie und Landwirtschaftlichen Wasserbau.
M. Grottker.
The Science of the Total Environment STENDL, Vol. 93, p 515-522, April 1990. 1 fig, 2 tab, 2 ref.

Descriptors: *Catchment basins, *Decontamination, *Gully pots, *Heavy metals, *Hydraulic design, *Model studies, *Simulation analysis, *Wastewater treatment, *Water pollution control, *Water pollution treatment, Particle size, Suspended solids, Water pollution, Water quality.

Gully pot systems have to fulfill two functions: the efficient discharge of surface water and the removal of pollutants. Since the removal efficiency is limited by the hydraulic loading, these are contrary tasks. In order to produce a more efficient design for a gully pot, about two hundred gully pots in different catchment areas have been examined and the pollutant removal analyzed. A simulation model is calibrated using these data and the model used to predict the pollutant removal and the frequency of gully pot cleansing for different kinds of gully pots. The necessary frequency of maintenance is twice a year for the dry gully pot (DGP) and once a year for the wet gully pot (WGP). Depending on the land use of the paved surface, the removal efficiency is about five to ten percent of the flushed surface pollution load for

LIBRARY U. OF I. URBANA-CHAMPAIGN

the DGP and about ten to forty percent for the WGP. (Author's abstract)

Descriptors: *Cadmium, *Chromium, *Copper, *Heavy metals, *Sewage, *Wastewater treatment, Activated sludge process, Chemical analysis, Particulate matter, Pollutants, Sedimentation, Sludge, Suspended solids.

Mechanisms of metal removal during sewage treatment were reviewed and the application of these mechanisms to cadmium, chromium and copper removals were discussed. Sampling was performed at Whitlingham sewage treatment works (Anglian Water), Norwich, to assess the removal mechanisms of these metals with reference to partitioning between particulate and soluble phases. Mass balances were performed as a means of quality control. It was concluded that the metals were primarily associated with suspended solids. However, considerable solubilization of cadmium and copper occurred during activated sludge treatment, possibly due to the addition of anaerobic solids in the overflow from a waste activated sludge consolidation tank. Chromium was not affected in a similar manner, possibly due to a change in its valency state. The removals of cadmium, chromium and copper were within the expected range. Final effluent concentrations of copper and chromium were below a value that would ensure compliance with the environmental quality objective for the receiving water, and final effluent cadmium concentrations were within the required standards. The Science of the Total Environment STENDL, Vol. 95, p 253-270, June 1990. 8 fig, 12 tab, 30 ref.

Descriptors: *Heavy metals, *Lead, *Nickel, *Sewage, *Wastewater treatment, *Zinc, Activated sludge process, Chemical analysis, Particulate matter, Pollutants, Sedimentation, Sludge, Solubility, Suspended solids.

Mechanisms of metal removal during sewage treatment were reviewed and the application of these mechanisms to lead, nickel, and zinc removals were discussed. Sampling was performed at Whitlingham sewage treatment works (Anglian Water), Norwich, to assess the removal mechanisms of these metals with reference to partitioning between particulate and soluble phases. Mass balances were performed as a means of quality control. It was concluded that lead was primarily associated with solids. However, it was solubilized during activated sludge treatment and this was possibly due to the addition of anaerobic solids in the overflow from a waste activiated sludge consolidation tank. The soluble phases of nickel and zinc were not significantly affected by any of the processes in the works. In general, nickel removals during primary sedimentation were lower than the other metals in this study, although they were higher than those reported by other authors. The addition of returned sludge liquors appeared to have a beneficial effect on lead removal during primary sedimentation by adsorbing soluble lead to the increased solids. However, removal of zinc and nickel appeared to have been unaffected by their addition. Final effluent concentrations of the three metals were below a value which would ensure compliance with the environmental quality objective of the receiving waters. Descriptors: *Arsenic, *Heavy metals, *Mercury, *Sewage, *Wastewater treatment, Activated sludge process, Chemical analysis, Particulate matter, Pollutants, Sedimentation, Sludge, Suspended solids.

The removal mechanisms of mercury and arsenic during sewage treatment were reviewed and possible biotransformation of mercury was discussed. Sampling was performed at Whitlingham sewage treatment work (Anglian Water), Norwich. Removal mechanisms were assessed with reference to partitioning between particulate and soluble phases. Further sampling and analysis was performed to determine the importance of mercury methylation. It was concluded that mercury behaved differently in the two studies, possibly due to a change in crude sewage speciation and the introduction of a picket fence thickener in the waste activated sludge consolidation tank. In situ methylation of mercury was found, especially in the presence of bacterial solids. Arsenic removals during primary sedimentation were very high, with soluble and particulate removals on a similar level. Paradoxically arsenic removals during activated sludge treatment were extremely low. (See also W91-02012 and W91-02013) (Author's abstract)

NITRIFICATION IN SLUDGE-AMENDED MICHIGAN FOREST SOILS.
Michigan State Univ., East Lansing. Dept. of Forestry.
A. J. Burton, J. B. Hart, and D. H. Urie.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 609-616, July/September 1990. 9 fig, 3 tab, 27 ref. U.S. EPA Cooperative Agreement S005551-01.

Descriptors: *Fate of pollutants, *Forest soils, *Michigan, *Nitrification, *Sludge, *Sludge utilization, Acidic soils, Digested sludge, Leaching, Nitrates, Soil cores, Soil treatment, Soil types, Waste disposal.

Net nitrification following liquid sludge application to four Michigan forest types was studied by aerobically incubating intact cores containing the forest floor and upper 10 cm of mineral soil. Significant net nitrification occurred in cores receiving surface applications of anaerobically digested municipal sludge (22.3 g N/sq m). Core nitrate N contents at 8 wk were 4.7, 5.3, 4.9, and 2.0 g/sq m for aspen (Populus spp.), northern hardwoods, oak (Quercus spp.), and pine (Pinus spp.) forest types, respectively. Net nitrification did not occur during 8 wk incubations of untreated control cores or cores receiving surface applications of sludge sterilized by freeze-drying (24.5 g N/sq m) or liming (25.7 g N/sq m), suggesting that the nitrifers responsible for net nitrification in cores receiving the anaerobically digested sludge were added with the sludge. Nitrate concentration at 8 wk in cores from an oak field site receiving anaerobically digested sludge (43.0 g N/sq m) 33 mo prior to incubation was 72% of that in oak site soil cores treated immediately prior to incubation (22.3 g N/sq m), indicating that nitrifying populations introduced with sludge 33 mo prior were still viable. Nitrate content at 8 wk in oak cores was 77% lower when sludge was incorporated. Nitrate contents in incubated soil cores could not be used to directly predict nitrate concentrations in soil leachate and groundwater beneath sludge-treated plots at the four field sites. Results indicate that nitrification and potential for nitrate leaching following sludge application to acid forest soils are influenced by sludge type, forest type, and history of prior sludge applications. urface (0-20 cm) samples from five soils amended
ith pig slurry, sewage sludge or cattle slurry
ere separated into four macro-, and three micro-
ggregate fractions of drysieving. Relative to the
ontrols, these amendments decreased the apparent
ensity and dispersibility of the aggregates, in-
eased slightly their water-retention capacity at -
33 MPa tension, but had no significant effect on
tra-porosity and particle size distribution of the
:gregates. On average, pig slurry reduced aggre-
te dispersibility by 34% in the sandy loam and
% in the sandy clay loam Modena soils. Sewage
udge and cattle slurry reduced dispersibility by
% and 26%, respectively, in the sandy loam
mporecchio and sandy clay loam Cremona soils.
ne organic carbon contents of the aggregates
counted for 73-98% of variability in their tend-
cy to disperse, whereas their silt plus clay con-
nts accounted for 38-96% of variability in the
oisture they retained at -0.03 MPOa tension. (Au-

Reliable procedures for the assessment of the toxicity of wastewaters are essential to implementing the Federal Clean Water Act. Health risk determination is limited to those chemicals for which toxicity data are available. Since long-term whole animal tests on large numbers of wastewater samples are impractical, shorter, cellular-based assays are necessary. The evaluation of two short-term bioassays indicated that the Salmonella test is the more sensitive indicator of mutagenic activity, whereas the Chinese hamster ovary (CHO) test is a sensitive detector of the presence of cytotoxic components in wastewater concentrates. Complementary use of multiple bioassays and concentration methods is necessary for the optimal detection and characterization of toxic components in wastewater. (D'Agostino-PTT)

AUTOTHERMAL FLUID BED FOR SLUDGE INCINERATION.
SEGHERS (N.V.) Engineering, Willebroek (Belgium).
H. A. Masson.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 405-416, 7 fig, 6 tab, 2 ref.

Descriptors: *Fluidized beds, *Incineration, *Sludge disposal, *Waste disposal, *Waste treatment, *Wastewater treatment, Capital costs, Design criteria, Energy costs, Environmental effects, Fly ash, Operating costs.

For large communities, incineration offers an attractive approach to sludge disposal because there is no need to stabilize the sludge, there is no need of nutrients, the waste volume reduction is tremendous, the end product is biologically and chemically inert (ash), the pathogens are completely destroyed, and the transport costs are reduced if not eliminated. Autothermal (without external fuel) incineration of sewage sludge is possible at 850 C if the air is preheated to 650 C and if the dry solid content of the sludge is at least 35% (for an organic fraction in the solids of about 65%). In order to maintain reasonable operating costs, the needed thermal energy supply for drying must be generated in the system itself. In the 'Zerofuel' process a multistage tray dryer does the required sludge drying with heat generated from flue gases. The system offers easy process control for the furnace and dryer and reduces sludge vapors by thermal cracking in the fluidized bed furnace. Flue gas analysis of the Zerofuel process at the Bruges, Belgium, plant showed that only the dust load and the SOx content exceeded the emission standards of 1986. The dust load can be further reduced by installing a third field in the electrostatic precipitator. SOx could easily be removed by introducing limestone in the bed. Washing with amines or a granular filter could be used to control mercury emissions. The system is set up in modular fashion so that various parts of the system can be taken out of operation and used elsewhere. The most sensitive parameters affecting cost of sludge incineration in the Zerofuel system are the nominal capacity, the load factor, the operating hours per year, and the quality of the sludge and its initial dry solids content. Effluent entering an on-site disposal system may contain varying combinations and amounts of potential contaminants. A vertical separation distance of 24 inches between the bottom of a soil absorption system and the seasonally high water table has been suggested as a minimum soil depth for the proper treatment of effluent, and the protection of groundwater. The effluent must pass through an unsaturated zone of soil to insure good aeration and slow travel, both of which are needed to: achieve good composition of organic materials, biodegradation of detergents, adsorption of effluent constituents to soil particles, die-off bacteria and viruses, and other processes contributing to the filtration and treatment of effluent. Depth to the wet season water table can be monitored with observation wells or can be estimated from soil morphological characteristics. Caution is advised when evaluating artificial drainage as a method to improve the performance of on-site sewage disposal systems. (Lantz-PTT)

Approximately 600,000 tons of solid wastes is generated annually by industries in the Thessaloniki are, of which about 65% is produced by a fertilizer chemical plant. Four solid wastes (sludge from the treatment of sulfuric acid production wastewater, ash from the roasting of iron pyrites, waste from a fertilizer unit, anhydrite produced by hydrofluoric acid and propellants production) from this plant are examined using the U.S. Environmental Protection Agency's (EPA) extraction procedure for toxicity in order to determine their content of toxic elements. Analysis of the extracts indicate that one of the samples generates arsenic at a concentration which exceeds the EPA criterion level for this element by nearly 50 times. Another sample is characterized by pH values that are below the EPA minimum values; however, the toxic element concentration does not exceed EPA limits. The extractability of toxic elements from the solid wastes using various extracting solutions is also examined in order to determine the chemical conditions under which the toxic compounds are soluble. The effectiveness of capping contaminated dredged material was investigated in a subaqueous depression in the Duwamish Waterway in Seattle, Washington. The disposal site consisted of a previously dredged depression located in approximately 22 m of water. Field studies were conducted to evaluate the consolidation of the capped material as well as the movement of contaminants from the dredged material into the uncontaminated cap material. Results showed that most of the dredged material consolidation at this site occurred during the first 2 weeks following capping. Monitoring of contaminant concentrations in the capped deposit for 18 months showed no movement of contaminants from the dredged material into the capping material. Data for Pb and Aroclor 1242 indicate that the dredged and cap materials formed a sharp, relatively unmixed interface over the 18 months of the study. (Author's abstract)

SUSTAINABLE RATES OF SEWAGE SLUDGE FOR DRYLAND WINTER WHEAT PRODUCTION: I. SOIL NITROGEN AND HEAVY METALS.
Colorado State Univ., Fort Collins. Dept. of Agronomy.
R. N. Lerch, K. A. Barbarick, D. G. Westfall, R. H. Follett, and T. M. McBride.
Journal of Production Agriculture, Vol. 3, No. 1, p 60-65, January/March 1990. 2 fig, 7 tab, 23 ref.

Descriptors: *Agricultural engineering, *Colorado, *Heavy metals, *Nitrogen, *Sludge disposal, *Sludge utilization, *Wheat, Cadmium, Copper, Cycling nutrients, Fertilization, Groundwater pollution, Lead, Nickel, Nitrates, Organic loading, Root zone, Zinc.

The application of sewage sludge to agricultural land has become the major method of sludge disposal in the US. Therefore, the long-term impact of sludge application to the soil environment must be investigated in order for proper loading rates to be employed. Thus, a field study was initiated in 1982 in Colorado, with the goal of evaluating the effects of sewage sludge on soil N, Zn, Cu, Cd, Ni, and Pb levels in a dryland wheat-fallow management system compared to commercial NH4NO3 fertilizer. Sewage sludge application resulted in increased soil NO3-N levels at harvest compared with the N fertilizer for all depths sampled and each year reported. The soil NO3-N in the root zone data showed that three sludge applications of 12 ton/acre resulted in significantly higher NO3-N levels throughout the root zone compared with the control of 50 lb N/acre. A loading rate of 3 ton/acre resulted in significantly greater NO3-N than the control at the 0 to 8-inch and 24 to 35-inch depths. Sludge application, at all loading rates tested, resulted in significantly increased NH4HCO3-diethylenetriaminepentaacetic acid extractable concentrations of Zn, Cu, Cd, Ni, and Pb compared to the control in the surface 8 inches of the soil. Because of the potential for NO3 contamination of groundwater (and metal buildup in the soil) by the higher sludge loading rates, a loading rate of 3 ton/acre is recommended as the maximum safe loading rate for this dryland wheat system. (See also W91-01504) (Author's abstract)

SUSTAINABLE RATES OF SEWAGE SLUDGE FOR DRYLAND WINTER WHEAT PRODUCTION: II. PRODUCTION AND INCOME.
Colorado State Univ., Fort Collins. Dept. of Agronomy.
R. N. Lerch, K. A. Barbarick, D. G. Westfall, R. H. Follett, and T. M. McBride.
Journal of Production Agriculture, Vol. 3, No. 1, p 66-71, January/March 1990. 4 tab, 23 ref.

Descriptors: *Agricultural engineering, *Colorado, *Cost analysis, *Cycling nutrients, *Fertilizers, *Grain crops, *Sludge disposal, *Sludge utilization, *Wheat, Cadmium, Crop production, Farm income, Fertilization, Groundwater pollution, Lead, Nickel, Nitrates, Nitrogen, Nutrients, Phosphorus, Zinc.

The increased production of sewage sludge in the US has led to many municipalities to consider the application of sludge to agricultural land as a feasible means of sludge disposal and nutrient recycling. A long-term field study was initiated in 1982 in Colorado, with the objective of evaluating the effects of sewage on gross income, yields, grain protein, and elemental content of dryland winter wheat compared to commercial NH4NO3 fertilizer. Sludge application has produced greater gross income than N fertilizer treatments primarily due to the premiums paid for high protein grain. Application of the 3 ton/acre sludge rate resulted in an average of $45/acre/year increase in income compared to the commonly used N rates of 50 to 60 lb N/acre. In two of the three years, neither the sludge nor the N fertilizer treatments resulted in significant yield responses. Sludge application has resulted in greater soil NH4-N and NO3-N compared to the N fertilizer treatments at boot stage over the last three years. However, because of the potential for NO(-3) contamination of groundwater due to oversupply of N (and the potential for metal buildup in the soil) by the 12 and 18 ton/acre rates, the lower sludge rate of 3 ton/acre is recommended for this dryland wheat production system. Grain levels of P and Zn have been increased by sludge application while the concentrations of Cd, Ni, and Pb have remained very low. (See also W91-01503) (Author's abstract)

PREVIEW ANALYSIS OF NATIONAL SLUDGE SURVEY.
Residuals Management Technology, Inc., Madison, WI.
R. D. Kuchenrither, and S. I. McMillan.
Biocycle BCYCDK, Vol. 31, No. 7, p 60-62, July 1990. 5 tab.

Descriptors: *Data interpretation, *Regulations, *Sludge analysis, *Wastewater facilities, Cadmium, Chemical analysis, Copper, Detection analysis, Environmental Protection Agency, Fate of pollutants, Heavy metals, Lead, Metals, Surveys, Zinc.

The National Sewage Sludge Survey conducted by the Environmental Protection Agency will be used to develop the agency's sludge regulations. A summary of the survey background and the preliminary results was reported. The survey randomly selected 209 wastewater treatment plants from all regions in the United States. The data, as compared to an earlier 40 city study, showed that most metals have been significantly reduced, except copper and zinc. A national average sludge, which indicates a mean concentration for metals and regulated organic compounds, was analyzed under the draft sludge regulations. Cadmium showed a surprisingly high concentration, but copper,lead and zinc were found at expected levels. Organics were essentially not detected in the survey due to high detection limits. The data should prove useful in developing future regulations, however, the high organic detection limit used for this survey may limit its effectiveness. (Miller-PTT)

PROPOSED EPA SLUDGE DISPOSAL REGULATIONS: PROJECT PURGATORY.
BCM Engineers, Inc., Plymouth Meeting, PA.
D. D. Garvey.
Water Pollution Control Association of Pennsylvania Magazine, Vol. 23, No. 4, p 13-21, July/August 1990. 6 fig, 4 tab.

Descriptors: *Economic aspects, *Legal aspects, *Pennsylvania, *Regulations, *Sludge disposal, Environmental Protection Agency, Heavy metals, Land reclamation, Metals, Risk assessment, Standards.

The EPA regulations Standards for the Disposal of Sewage Sludge are described with emphasis on the aspects that impact Pennsylvania. The initial estimate of the economic impact was that 157 million dollars per year nationwide would be needed to comply with these regulations. This figure was believed to be a gross underestimate. Metals and organics that were not previously a concern, such as arsenic, molybdenum, selenium, and beryllium would now be limiting factors, Congress mandated EPA to adopt a risk assessment approach to developing methodologies and disposal standards, some of which are not cost effective, implementable, or technologically achievable. The proposed regulations could have a significant impact on sludge disposal methods such as distribution and marketing, agricultural use and reclamation. (Miller-PTT)

Journal of Production Agriculture, Vol. 3, No. 3, p 340-344, July/September 1990. 11 tab, 12 ref. USDA-CSRS Special Grant No. 85-CRSR-2-2548.

Descriptors: *Lime, *Sludge disposal, *Soil amendments, *Waste disposal, Dairy industry, Fescues, Forages, Grasses, Loam, Nitrogen, Phosphorus, Potassium, Silt.

A lime stabilizing sludge (LSS) from a dairy wastewater treatment plant was evaluated in field studies on a silt loam soil as a source of lime and P for a tall fescue (Festuca arundinacea Shreb.) meadow. An initial treatment of almost 9000 gal/acre significantly increased hay yields and raised the surface soil (0-3 in) above the pH and Bray and Kurtz no. 1 P sufficiency levels for tall fescue. Supplemental N and K were required to achieve maximum yields of the fescue treated with the lime stabilized biomass. There are in sufficient reserve lime in the LSS to offset the acidifying effects of 4 years of NH4NO3 top-dressing. (Author's abstract)

Descriptors: *Florida, *Spray irrigation, *Tallahassee, *Wastewater disposal, *Water pollution sources, Nitrates, Surficial aquifer, Treated wastewater, Upper Floridan Aquifer.

The city of Tallahassee, Florida began applying sewage treatment-plant effluent to a sprayfield southeast of the city in 1980. Fertilizers containing inorganic nitrogen were also applied in conjunction with the operation of a commercial farm at this site. Analysis of groundwater in the surficial aquifer and the Upper Floridan aquifer have indicated that nitrate concentrations in some wells exceed the prescribed drinking water maximum contaminant level of 10 mg/L (nitrate as nitrogen). Nitrate concentrations greater than the maximum contaminant level were not detected in samples from monitoring wells outside the sprayfield boundary. Analyses of water from the unsaturated zone indicated that conversion of organic nitrogen and ammonia to nitrate was complete before the nitrogen-enriched water reached the water table. Groundwater samples from wells in the surficial and Upper Floridan aquifers less than 100 ft deep located inside sprayed areas had mean concentrations of nitrate much higher than samples from similar wells located outside sprayed areas at the southeast sprayfield. These shallow wells inside the sprayed areas were the only wells in which the maximum contaminant level for nitrate was exceeded. Analyses of the nitrogen isotope ratios in groundwater were used to determine whether the major source of nitrogen was treated sewage or fertilizers. The nitrogen isotope ratios in contaminated groundwater at the southeast sprayfield were compared to those at another sprayfield southwest of the city, where treated sewage was the sole source of nitrogen. Statistical analyses indicated a significant difference in the nitrogen isotope ratios at the two sites, indicating that both nitrogen sources are significant at the southeast sprayfield. (USGS)

USE OF PUMP-OUT FACILITIES BY RECREATIONAL BOATERS IN MARYLAND.
Maryland Univ., College Park. Dept. of Agricultural and Resource Economics.
I. E. Strand, and G. R. Gibson.
Estuaries ESTUDO, Vol. 13, No. 3, p 282-286, September 1990. 3 tab, 11 ref.

Descriptors: *Boats, *Maryland, *Pumps, *Wastewater facilities, *Water pollution prevention, Marinas, Recreation.

The State of Maryland sponsored a survey of 500 Maryland boaters to determine their use of marina facilities to discharge sewage from portable toilets or holding tanks. Results of the survey are reported as well as an examination of some of the factors that contribute to the use of pump-out facilities. Under 10% of Maryland's marinas have facilities available to pump-out holding tanks or portable toilets. Less than 1 in 20 boaters has ever used such a facility. Using a discrete choice behavior model, it was found that boaters with portable toilets were more likely to use holding tanks, especially if the holding tanks were equipped with macerating devices. The price of using the pump-out facility negatively influenced pump-out use. It was also found that vessels in transition were less likely to use marina facilities. The availability of a pump-out facility at a boater's marina increased the likelihood of pumping by two-fold. In Maryland, reduction of boat-generated pollution will likely require of a policy of both extensive pump-out services and low costs for the services. (Author's abstract)

SUCCESSION OF THE PLANKTON COMMUNITY DURING COASTAL RECLAMATION WITH THE SOLID WASTES.
Kitakyushu Municipal Inst. of Environmental Health Sciences (Japan).
M. Yamada, Y. Hanada, A. Miyazaki, A. Tsuruta, and Y. Yoshida.
Nippon Suisan Gakkaishi (Bulletin of the Japanese Society of Scientific Fisheries) NSUGAF, Vol. 56, No. 5, p 729-734, May 1990. 5 fig, 6 ref.

Descriptors: *Land reclamation, *Landfills, *Plankton, *Succession, *Waste disposal, *Water pollution effects, Japan, Oxidation ponds, Population dynamics, Solid wastes, Water quality.

The plankton community was investigated in a coastal pond at Kitakyushu City, Northern Kyushu, Japan. This pond was on a landfill where various kinds of solid wastes, including soil from land sources, domestic wastes, and industrial wastes, had been dumped from 1980 to 1987. The cell density of phytoplankton in the pond increased gradually and red tides were observed beginning in 1983. The plankton community was dominated by several species of diatoms, dinoflagellates, Cryptophyceae, green algae, filamentous bacteria, ciliates, and rotifers. Some of these occurred continuously, others cyclically during certain periods. Near the end of reclamation, the phototrophic red sulfur bacterium Thiocapsa roseopersicina predominated twice and discolored the water to purple-brown. The first time, phytoplankton almost disappeared from the pond but recovered after a few months; the second time, phytoplankton occurred abundantly with the phototrophic bacterium. In this pond, phytoplankton and zooplankton adapting to the water quality seem to have appeared one after another during most of this investigation. It is suggested that the large quantities of plankton which were observed are important in improving the water quality in the pond, and that the pond acts as an oxidation pond for polluted water from the solid wastes dumped. (Author's abstract)

CHANGE OF WATER QUALITY AND COMPOSITION OF PLANKTON IN THE POND OF RECLAIMED SITE.
Kitakyushu Municipal Inst. of Environmental Health Sciences (Japan).
M. Yamada, Y. Hanada, S. Sueta, A. Tsuruta, and Y. Yoshida.
Nippon Suisan Gakkaishi (Bulletin of the Japanese Society of Scientific Fisheries) NSUGAF, Vol. 56, No. 5, p 735-741, May 1990. 4 fig, 2 tab, 13 ref.

Descriptors: *Land reclamation, *Plankton, *Population dynamics, *Waste disposal, *Water pollution effects, *Water quality trends, Japan, Ponds, Solid wastes, Species composition, Succession.

Changes of plankton populations in relation to changes in water quality were investigated in a coastal pond on reclaimed land at Kitakyushu City, Japan. This site had been used for the disposal of various solid wastes. The pond water became rapidly brackish and polluted during the seven years required for the completion of the reclamation. Agglomerative cluster analysis was used to arrange the water quality in this pond in five clusters. Four water factors--pH, chlorinity, suspended solids, and COD--and four seasons--winter (February), spring (May), summer (August), and autumn (November)--were employed. The occurrence of dominant phytoplankton and the five clusters of water quality were compared; it was found that the change from marine plankton to brackish-water plankton was observed around 10 ppt in chlorinity, and freshwater plankton began to appear below 5

LIBRARY U. OF I. URBANA-CHAMPAIGN

ppt in chlorinity. The marine plankton's highest COD value was 17 mg/L, but freshwater and brackish-water forms were able to occur at CODs as high as 40 mg/L. One species of phototrophic bacterium was observed in one abnormal cluster which had a COD of 160 mg/L and a pH of 11.2. There was thus an intimate relation between the occurrence of characteristic plankton and the water quality in each of the five clusters. The occurrence of planktonic biota and the variation of water quality were also affected by the climatic conditions, such as increased temperature and heavy rainfall. (Author's abstract)

Desalination DSLNAH, Vol. 78, No. 1, p 27-40, July 1990. 2 fig, 12 tab, 5 ref.

Descriptors: *Desalination wastes, *Florida, *Potable water, *Reverse osmosis, *Surface water, *Wastewater disposal, Desalination, Economic aspects, Membrane processes, Permits, Radioactive wastes, Testing procedures.

On the most recent list available from the Florida Department of Environmental Regulation (FDER), there are 96 membrane plants in Florida treating water for potable consumption. From the cursory studies and surveys conducted to date, some concern has been generated regarding dissolved oxygen, gross alpha radioactivity, fluorides and sulfides normally present in reverse osmosis (RO) concentrates. None of these were produced by RO process itself and it would appear that post-treatment methods can be developed to eliminate any adverse effect on the environment. However, compliance with the radioactivity standards is a difficult problem that is not easily resolved. There is a wide disparity in post-treatment methods being carried out at each facility. This is most probably due to the differences in permitting requirements (i.e., some plants are given potable water permits, some are given industrial waste permits). Finally, there are apparent differences in the types of testing and reporting being carried out. Case histories and economic considerations are also given. (Author's abstract)

DISPOSAL OF CONCENTRATE FROM BRACKISH WATER DESALTING PLANTS BY USE OF DEEP INJECTION WELLS.
A. Muniz, and S. T. Skehan.
Desalination DSLNAH, Vol. 78, No. 1, p 41-47, July 1990. 1 fig.

Descriptors: *Brackish water, *Desalination wastes, *Florida, *Injection wells, *Reverse osmosis, *Wastewater disposal, Desalination, Design standards, Membrane processes, Monitoring wells, Regulations, Wastewater treatment.

The conventional method of disposal of the concentrate from reverse osmosis plants in Florida has been discharge to a brackish surface water body. In Florida, however, the distance to saline water bodies and regulatory constraints can resist this type of disposal. Under the appropriate site-specific conditions, deep injection wells can offer a feasible solution to disposing of concentrates from reverse osmosis plants. Deep injection well systems can be reliable, environmentally safe, and cost-effective. Regulations affecting deep injection wells and typical designs are discussed. The Englewood (Florida) Water District deep injection well is described in detail. Instrumentation for this injection well disposal system includes continuous flow and pressure recorders plus sampling of the monitor well on a weekly, monthly, and quarterly basis. There has been considerable experience with deep injection wells for the disposal of treated wastewater effluents in the state, so that deep injection wells are a proven technology for South Florida. A major problem in California's San Joaquin Valley is the disposal of subsurface agricultural drainage water. The valley is 260 miles long and dose not have an acceptable drainage water outlet to the ocean. The feasibility of storing and disposing drainage water desalting plant concentrates in a salt-gradient solar pond was investigated as part of a larger feasibility study on reclaiming agricultural drainage water for beneficial use. As part of the desalting feasibility investigation salt-gradient solar ponds for brine storage are being studied. It is method of storing and using concentrated desalting concentrates to produce power. The Los Banos Demonstration Desalting Facility was constructed to test the feasibility of reclaiming the drainage water. The facility is of the zero-discharge type, minimizing environmental impacts, and uses a three stage reverse osmosis system with thermal evaporation to achieve a 96% recovery of fresh water. Research in the Las Banos system is at the energy production stage and is focused on using a Rankine-cycle turbine for power generation using hot brine from the solar pond system. The cost of a solar pond facility is close to that of a Class I hazardous waste disposal site at from $50,000 (no pond linings) to $250,000 (double linings) per acre. The Solar pond concept shows a great deal of promise for helping manage agricultural drainage in California's San Joaquin Valley. (VerNooy-PTT)

DISPOSAL OF CONCENTRATES FROM BRACKISH WATER DESALTING PLANTS BY MEANS OF EVAPORATION TECHNOLOGY.
Bechtel National, Inc., Washington, DC.
L. Awerbuch, and M. C. Weekes.
Desalination DSLNAH, Vol. 78, No. 1, p 71-76, July 1990. 2 fig, 4 ref.

Descriptors: *Brackish water, *Brines, *Desalination wastes, *Evaporators, *Reverse osmosis, *Waste disposal, *Wastewater disposal, Desalination, Feedwater treatment, Scaling.

Reverse osmosis plants discharge a permeate stream with low dissolved solids (TDS) and a reject stream with high TDS. The use of reverse osmosis (RO) plants to desalt brackish water in South Florida has increased rapidly in the last decade. The concentration of scale forming species such as calcium sulfate and silica usually limits RO recovery in these plants to about 75% of the total feedwater flow. The remaining 25% of the flow is reject brine which presents a serious disposal problem for plants in inland locations. Brine concentrators are being used to reduce the RO reject brine to 2% of the overall flow and so significantly reduce the disposal problem. Two versions of the evaporative brine concentration process known as vapor compression evaporation (VCE) are discussed. Typical operating conditions obtained at successfully operating plants are listed, and projected hybrid plant performance is calculated. Small size VCE system may be installed for $7.50/gal/day. As the sizes increase, the installed price may drop to $6.00/gal/day. (Author's abstract)

CHARACTERIZATION OF COMPOST WITH RESPECT TO ITS CONTENT OF HEAVY METALS, PART I: SAMPLE DIGESTION AND ICP-AES ANALYSIS.
Amsterdam Univ. (Netherlands). Vakgroep Milieukunde.
J. W. A. Lustenhouwer, J. A. Hin, F. J. M. J. Maessen, and G. den Boef.
International Journal of Environmental Analytical Chemistry IJEAA3, Vol. 39, No. 3, p 209-222, 1990. 3 fig, 11 tab, 18 ref.

Descriptors: *Analytical techniques, *Chemical analysis, *Compost, *Emission spectroscopy, *Heavy metals, *Sample preparation, *Sludge disposal, Composting, Digestion, Domestic wastes, Elements, Monitoring, Soil amendments, Testing procedures, The Netherlands, Waste identification.

In recent years the Dutch policy on management of household waste has been increasingly directed towards recycling. Composting might be a solution for about one half of household waste; however, there is a growing concern on the quality of compost, especially with regard to its content of heavy metals. A study was conducted to develop a procedure for the determination of heavy metals in compost. An unambiguous analytical procedure must be available to enable supervision of the legal regulations on maximum tolerable content of heavy metals. The element determination stage, including the digestion of a test portion and element determination in the test solution, is reported. Analysis was studied for a variety of types of composts as well as for a sewage sludge amended soil. Aqua regia digestion was examined using conventional as well as microwave heating. The performance of both procedures is similar with respect to accuracy and precision. Microwave heating was preferred because that procedure is less time-consuming. Simultaneous determination of the elements chromium, copper, nickel, lead, and zinc by inductively coupled plasma-atomic emission spectroscopy was feasible. However, due to the occurrence of severe spectral interferences, cadmium had to be determined separately. (Vernooy-PTT)

EFFECT OF PULP AND PAPER MILL EFFLUENT IRRIGATION ON CARBON DIOXIDE EVOLUTION IN SOILS.
Tamil Nadu Agricultural Univ., Coimbatore (India). Dept. of Agricultural Microbiology.
K. Kannan, and G. Oblisami.
Journal of Agronomy and Crop Science ZAPFAR, Vol. 164, No. 2, p 116-119, 1990. 1 fig, 2 tab, 13 ref.

Descriptors: *Carbon dioxide, *Effluents, *Industrial wastewater, *Pulp and paper industry, *Soil gases, *Wastewater irrigation, Conductivity, Decomposing organic matter, Field tests, India, Microorganisms, Soil bacteria, Soil contamination, Soil organic matter, Wastewater farming.

Soil samples were collected from the field under paper mill effluent irrigation for the past 1, 2, 3, and 15 years. Pulp and paper mill wastewater irrigation increased pH, electrical conductivity (EC), organic carbon, and exchangeable sodium content of soils. The combined effluent irrigation over a period of 15 years resulted in the increased accumulation of sodium and other soluble salts. Soils under effluent irrigation for the past 15 years showed the maximum EC which might be due to accumulation of salts over a long period of time. The increase in organic matter content of soils accelerated microbial activity and hence accelerated substrate decomposition with the release of carbon dioxide. There was a peak followed by a steady decline in the rate of carbon dioxide evolution in effluent irrigated soils. The total amount of carbon dioxide evolved in the control was 5.039 mg/50 g soil (dry weight basis over 15 days), while combined effluent irrigation over a period of 15 years increased the carbon dioxide evolution rate by a factor of five. The carbon dioxide evolution results of the present investigation suggest that pulp and paper mill effluent irrigation to soil was not harmful to the soil microbial activity. (Verhooy-PTT)

F. Water Treatment and Quality Alteration

TREATMENT OF EUTROPHIC WATERS IN SOUTH AFRICA.
Water Research Commission, Pretoria (South Africa).
J. Offringa.
South African Journal of Science SAJSAR, Vol. 86, No. 1, p 6-8, January 1990. 2 fig, 8 ref.

Descriptors: *Eutrophic lakes, *South Africa, *Water quality, *Water treatment, Chlorination, Filtration, Flocculation, Potable water, Settling, Surface water, Water quality control.

Eutrophication of surface waters has caused increased concern in South Africa and elsewhere regarding the supply of potable water of good quality from these sources. Sedimentation and filtration alone are not adequate to treat enriched waters anymore. Pre-chlorination improves the sedimentation of flocculated algae but results in taste and order problems and the excessive formation of halogenated hydrocarbons. The Division of Water Technology of CSIR has developed considerable expertise in the application of Dissolved Air Flotation (DAF) alone, and in combination with filtration (DAFF), resulting in the construction of a number of plants for the treatment of a variety of enriched waters. Whereas the traditional water treatment by sedimentation relied on the settlement of solids in the water, the lighter nature of algae and other suspended organics found in eutrophic waters rendered the DAF process more suitable for solids removal and so it is increasingly being used in South Africa and abroad. The need to incorporate the sedimentation into the DAFF process to treat surface waters of variable quality, and to remove tastes, odors and other micropollutants has been identified, and further research has been directed accordingly. HYDROGEOLOGY AND HISTORICAL ASSESSMENT OF A CLASSIC SEQUENTIAL-LAND USE LANDFILL SITE, ILLINOIS, USA.
Northern Illinois Univ., De Kalb. Dept. of Geology.
C. J. Booth, and P. J. Vagt.
Environmental Geology and Water Sciences EGWSEI, Vol. 15, No. 3, p 165-178, May/June 1990. 6 fig, 5 tab, 19 ref, 3 append.

Descriptors: *Geohydrology, *Groundwater pollution, *Illinois, *Landfills, *Path of pollutants, *Water pollution sources, Clay liners, Contamination, Groundwater quality, History, Land use, Leachates, Resource management.

The Blackwell site in northeastern Illinois was a classic sequential-use project combining land reclamation, a sanitary landfill, and a recreational park. A recent assessment of leachate generation and groundwater contamination to the site's unfinished record is presented. Hydrogeological studies show that: (1) the landfill sits astride an outwash aquifer and a till mound, which are separated from an underlying dolomite aquifer by a thin, silty till; (2) leachate leaks from the landfill at an estimated average rate between 48 and 78 cubic m/day; (3) the resultant contaminant plume is virtually stagnant in the till but rapidly diluted in the outwash aquifer, so that no off-site contamination is detected; and (4) trace volatile organic carbon VOC levels in the dolomite probably indicate that contaminants have migrated there from the landfill-derived plume in the outwash. Deviations from the original landfill concepts included elimination of a leachate collection system, increased landfill size, local absence of a clay liner, and partial use of nonclay cover. The hydrogeological setting was unsuitable for the landfill as constructed, indicating the importance of detailed geological consideration in landfill and land-use planning. (Author's abstract)

FIXED BED ADSORPTION FOR THE REMOVAL OF POLLUTANTS FROM WATER.
Queen's Univ., Belfast (Northern Ireland). Dept. of Chemical Engineering.
G. McKay, and M. J. Bino.
Environmental Pollution ENPOEK, Vol. 66, No. 1, p 33-53, 1990. 17 fig, 4 tab, 7 ref.

Descriptors: *Activated carbon, *Adsorption, *Mercury, *Phenols, *Water treatment, Chlorophenols, Design criteria, Fixed bed columns, Flow rates, Operating costs.

The adsorption of phenol, p-chlorophenol and mercuric ions from aqueous solution onto activated carbon has been studied in fixed bed columns. The influence of varying parameters such as bed depth, solution flowrate and pollutant concentration has been studied. The Bed Depth Service Time (BDST), using the break point of the effluent concentration, has been used to analyze the experimental data and identify design correlations. The BDST model can predict service time versus bed depth according to the desired percentage breakthrough value. The breakthrough curve represents the shape of the pollutant concentration curve as the solution leaves the bed. The general observation is that no significant increase in throughput is achieved by varying the percentage breakthrough because the breakthrough curves are rather steep and, consequently, the mass transfer zone is very short. Two types of variables are recognized as important in optimizing water treatment processes: primary process variables which are mainly determined by carbon exhaustion rates; and process variables which affect the operating costs as a result of changes in the required level of effluent purity, influent liquid purity, temperature, and viscosity, as well as carbon particle size. Optimization procedures based on the Empty Bed Residence Time have been applied to the data, showing that the carbon exhaustion rate is higher for lower percentage breakthrough required. REVIEW OF OZONE GENERATING FACILITIES IN SOME U.S. WATER AND WASTEWATER TREATMENT PLANTS.
Northeast Ohio Regional Sewer District, Cleveland, OH.
L. Debevec.
Ozone: Science and Engineering OZSEDS, Vol. 12, No. 2, p 95-105, 1990. 13 tab, 6 ref.

Descriptors: *Ozonation, *Wastewater facilities, *Water treatment facilities, Feedwater treatment, Municipal wastewater, Municipal water, Ozone, Water quality management.

In previous years, the start-up and operation of ozone systems at U.S. municipal water and wastewater treatment plants has resulted in numerous problems. Some of these problems were of such a magnitude that the operating agency decided to abandon the ozone system. In other cases the systems are operating with the problems resolved. Many of the problems were not unique to any one system. A summary includes the following responses: (1) at least three installations had problems with fires in the ozone destructor; (2) five of the installations experienced problems with the discharge valves; (3) foaming problems are prevalent in almost every contractor; (4) six of the installations use oxygen to generate ozone, four of the installations use air, only one uses both air or a mixture of air and oxygen; (5) of the 11 plants, 9 installations have blowers to remove the ozone contractor off-gas, one installation used the system pressure to force the off-gas through the ozone destructor, while the last facility did not know how the off-gas was removed form the contactor; and (6) of the 5 air-to-ozone generation installations, 4 were a gas-to-gas (freon) refrigeration system, and the other uses a liquid-to-gas (freon) system. REMOVAL OF ATRAZINE BY OZONE AND OZONE-HYDROGEN PEROXIDE COMBINATIONS IN SURFACE WATER.
Laboratoire Central de la Lyonnaise des Eaux 38, rue de la President Wilson, 78230 le Pecq, France.
J. P. Duguet, F. Bernazeau, and J. Mallevialle.
Ozone: Science and Engineering OZSEDS, Vol. 12, No. 2, p 195-197, 1990. 2 tab, 4 ref.

Descriptors: *Atrazine, *Hydrogen peroxide, *Ozonation, *Ozone, *Water treatment, Adsorption, Filtration, Maximum contaminant level, Pesticides, Water quality.

Atrazine is one of the most frequently identified pesticides in Europe. Current European standards stipulate that the maximum contaminant level (MCL) for an individual pesticide is 100 ng/L. This regulation stresses the need for a low-cost and effective treatment system. Adsorption is one promising solution, but in general, breakthrough of the granular activated carbon filter occurs rapidly. Recent research has shown that ozonation alone, utilized according the usual practical conditions, removes atrazine poorly, 15-25%. High oxidation reaction rates of the hydroxyl free radical suggest that combinations of O3/H2O2 is a better removal method. This study indicates that application of an ozone dose of 5.1 mg/L without hydrogen peroxide allows a 46% reduction in atrazine concentration, but the MCL was not reached. The coupling of ozone and hydrogen peroxide increases the removal of atrazine. The removal efficiency increases as the applied oxidant dose increases. It is therefore possible to reach the atrazine MCL by applying in this case, a 3 mg/l dose. (Author's abstract)

OZONATION AT BELLE GLADE, FLORIDA: A CASE HISTORY.
North Carolina Univ. at Charlotte. Dept. of Envi-

LIBRARY U. OF I. URBANA-CHAMPAIGN

ronmental Sciences and Engineering.
P. C. Singer, K. Robinson, and R. A. Elefritz.
Ozone: Science and Engineering OZSEDS, Vol. 12, No. 2, p 199-215, 1990. 11 fig, 4 tab, 4 ref.

Descriptors: *Color removal, *Ozonation, *Water treatment, Ammonia, Belle Glade, *Florida, Chlorine, Chloroform, Color, Florida, Nitrification, Organic matter, Ozone, Trihalomethanes, Turbidity, Water quality control.

A two-stage ozonation process for the treatment of lake water high in organics, color and thrihalomethanes (THM) concentration was installed at the city of Belle Glade, FL in October of 1984. The average TOC was 30 mg/l with values of up to 755 mg/L The color averaged 100 color units up to 500 color units. The THM level reached nearly 1,000 mg/L. The new treatment process applied 3 mg/l of ozone to the raw water ahead of the flash mix basin, lime softening, alum and polymer coagulation, clarification, recarbonation, and addition of 3 mg/l ozone prior to filtration. Post-chlorination then produced distribution system THM concentrations averaging 124 microgm/L Distribution of THM's shifted from 85% chloroform by the original process to 40% after adoption of ozonation, the balance comprising brominated species, but not bromoform. In 1987, the treatment process was modified by adding chlorine and ammonia at the outlets of the pre-, and intermediate stages of ozonation and abandoning free chlorination. This has further reduced the distribution system THm levels to 20-30 microgm/L. Filtered water turbidity and color have been improved. The use of chloramines after ozonation controls the nuisance aquatic growth in the clarifiers and recarbonation basins, produces a combined chlorine residual which can be maintained throughout the distribution system. Periodic use of free chlorine in the distribution system is required to prevent elevated heterotrophic plate counts and the formation of excessive concentrations of nitrite ion due to biological regrowth and nitrification. ULTRAVIOLET DISINFECTION OF POTABLE WATER.
Southern California Metropolitan Water District, Los Angeles.
R. L. Wolfe.
Environmental Science and Technology ESTHAG, Vol. 24, No. 6, p 768-772, June 1990. 1 fig, 3 tab, 38 ref.

Descriptors: *Disinfection, *Drinking water, *Potable water, *Ultraviolet radiation, *Water treatment, Bacteria, Groundwater, Protozoa, Surface water, Viruses.

Pending regulations by the Environmental Protection Agency regarding control of microbial and chemical contaminants in drinking water has prompted the evaluation of ultraviolet (UV) radiation for primary disinfection of surface and groundwater supplies. Excellent results for inactivation of both bacteria and viruses have been obtained with the combined advantages of short contact times, low relative cost, few undesirable disinfection by-products, and enhanced breakdown of taste and odor contaminants. The drawbacks include inaccuracy of current systems for UV dose measurement, limitations on practical size of cost-effective treatment plants, the necessity of postdisinfection for surface waters, and the requirement of much higher UV doses for the inactivation of protozoan cysts. To date only a limited number of microorganisms have been examined and no actual field information has been obtained. In addition, complete information on the resistance of enteric viruses is not yet available. (D'Agostino-PTT)

Descriptors: *Chlorination, *Disinfection, *Drinking water, *Mutagenicity, *Public health, *Water quality, *Water treatment, Activated carbon, Chlorine, Filtration, Organic matter, Oxidation, Ozonation, Raw water.

Data on raw water quality, oxidation treatment practices, and the resulting mutagenic properties of the treated water were compiled from pilot-and full-scale treatment experiments to evaluate which parameter might produce variability in the results of a mutagenic study. Analysis of the data and comparison of treatment practices indicated that the measured mutagenic activity is strongly related to the characteristics of the organic matrix in the raw water; the methodology used to sample and detect mutagens; the scale of the study both in terms of treatment flow and period of study; and the point at which and the conditions under which oxidants are added during treatment. In disinfection systems in full-scale water treatment plants, when raw water is pretreated, and high concentrations of organics are present in the raw water, both ozonation and chlorination increase mutagenic activity. However, no significant difference in mutagenicity was found between the two oxidants. Also, both in the case of a nitrified groundwater and a clarified surface water, the mutagenic activity of the water after ozonation was related to its mutagenic activity before ozonation. Also, in both of these cases, mutagenic activity decreased after granular activated carbon (GAC) filtration. When GAC filtration follows ozone disinfection, early addition of oxidants may not be deleterious to the finished water quality. When chlorine or chlorine dioxide is added after GAC filtration, chlorine dioxide was found to produce a less mutagenic water. Although these conclusions suggest means of controlling mutagenic activity during treatment, it must be stressed that the measurement of mutagenicity is a presumptive index of contamination level. IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 367-374, 37 ref.

Descriptors: *Biofilms, *Biofouling, *Domestic water, *Drinking water, *Fouling, *Plumbing, *Public health, *Water distribution, *Water treatment, Aeromonas, Aromatic compounds, Biocides, Copper, Corrosion, Disinfection, Legionella, Path of pollutants, Pseudomonas, Scotland.

Water treated and supplied for drinking and domestic purposes is not sterile and biofilms are normally found on the materials used in distribution and plumbing systems. The growth of low numbers of microorganisms in the planktonic and sessile phases is usually considered only in terms of aesthetic or operational problems. However, biofilms have been linked to a unique corrosion of copper pipework in institutional buildings in Scotland and biofouling of recirculating water systems is believed to contribute to the proliferation of opportunistic pathogens such as Pseudomonas aeruginosa, Aeromonas hydrophila and Legionella pneumophila. These organisms are occasionally present in treated water and all have been identified in plumbing systems biofilms. While planktonic microorganisms are relatively easily killed by biocides, organisms in the biofilms are more refractory due to poor penetration rates. A continuous culture laboratory model has been developed to investigate the factors responsible for biofilm formation on the surfaces of plumbing materials. It has already proved valuable to assess the implications and design solutions to control copper corrosion and legionellae colonization. The same approach is now being used to address issues related to potable supplies such as nitrite formation, residual disinfection, degradation of coal tar linings releasing polyaromatic hydrocarbons and the control of indicator organisms. Descriptors: *Coagulation, *Flocculation, *Ozonation, *Pesticides, *Water treatment, Activated carbon, Chlorination, Chlorine, Drinking water, Fungicides, Groundwater pollution, Herbicides, Insecticides.

The effectiveness of various procedures or coupled procedures used in treatment works to eliminate pesticides from drinking water are examined. At the mg/L concentration level using surface water enriched in pesticides of different chemical origins, laboratory coagulation-flocculation tests using iron and aluminum salts revealed that, of all the pesticides, only methoxychlor and DDT are more than 90% eliminated. For concentrations ranging from the nanogram/L level to 100 micrograms/L, in the

laboratory or at pilot level, DDT was eliminated up to 98%. For lindane, aldrin, dieldrin, parathion, 2,4-D, and endosulfan, the degree of elimination varied between 10% and 60%. Coagulation-flocculation removal of pesticides was enhanced at optimal rates with various coagulants for different pesticides at different pH. Ozonation is extremely effective for the removal of triazine pesticides. When activated charcoal is used for pesticide removal the dose of powder added must be in accord with the level of pesticide to be removed requiring continual monitoring of pesticide levels. Filtering through activated charcoal reduces the peak level of pesticides in treated water. However, it is difficult to predict the effectiveness of this peak-lowering and consequently to guarantee that the maximum acceptable concentration of 100 nanograms/L will not be exceeded. REMOVAL OF PESTICIDES BY ADSORPTION ONTO POWDERED ACTIVATED CARBON: THE EFFECT OF HUMIC SUBSTANCES.
Limoges Univ. (France). Lab. de Genie Chimique, Traitement des Eaux.
J. Ayele, B. Fabre, and M. Mazet.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 497-504, 5 fig, 3 tab, 24 ref.

Descriptors: *Activated carbon, *Adsorption, *Humic substances, *Pesticides, *Water treatment, Atrazine, Fulvic acids, Humic acids, Hydrogen ion concentration, Insecticides, Lindane, Pentachlorophenol, Solubility.

Factors affecting the adsorption of lindane, atrazine, and pentachlorophenol (PCP) and humic substances onto activated carbon were examined. The concentrations of pesticides and humic substances (humic and fulvic acids) in solutions were measured before and after shaking in the presence of the activated carbon at 25 C by UV absorbance, high pressure liquid chromatography, or scintillation counting. Results showed that dependence of solubility on pH is strong for PCP but not very important for atrazine or lindane. PCP water solubility increased with increasing pH. Adsorption of PCP was decreased when solubility was increased. The extent of binding of pesticides increased as water solubility decreased, and depended on the source and concentration of the humic substances. Humic substances improved the removal efficiency of pesticides, while the presence of pesticides slightly enhanced the removal of the humic substances by activated carbon. Adsorption onto activated carbon was more rapid for PCP than for atrazine or lindane. The pesticide-humic substances complex was more easily adsorbed than pesticides or humic substances alone. NEW TECHNOLOGY IN A WATER COMPANY.
South Staffordshire Waterworks Co., Walsall (England).
J. Carter.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 256-2264, June 1990. 3 fig, 1 tab.

Descriptors: *Automation, *Data processing, *Water conveyance, *Water treatment, Chemical analysis, Computer-aided design, Computers, Data storage and retrieval, Excavation, Inspection, Leakage, Monitoring, Remote sensing, Technology, Telemetry, Water management.

The South Staffordshire Water Company serves a population of 1.25 million within an area of 1502 sq km, and has employed new technology across a broad spectrum of its operational, scientific and administrative activities. Applications of this technology include electronic remittance processing, a mail room multimailer, a computerized customer service system, automation of chemical analysis, automatic fuel issue and recording equipment, computer-aided drawing (CAD) in the design office, telemetry and electronic leak detection, fiberoptic inspection methods, and location sensors for excavation. Available technologies have been investigated, adapted and developed to meet the Company's particular requirements for improved efficiency, new regulations and standards, and cost savings. The Company is a leading innovator in the use of new technology; this success has been achieved through the encouragement and development of new ideas and the careful control and monitoring of new projects. SURFACE IONIZATION OF POLYNUCLEAR SPECIES IN AL(III) HYDROLYSIS--I. TITRATION RESULTS.
Syracuse Univ., NY. Dept. of Civil and Environmental Engineering.
R. D. Letterman, and S. R. Asolekar.
Water Research WATRAG, Vol. 24, No. 8, p 931-939, August 1990. 14 fig, 2 tab, 29 ref. National Science Foundation grant no. CEE-8315971.

Descriptors: *Aluminum, *Chemical reactions, *Coagulants, *Hydrolysis, *Ionization, *Metals, *Water chemistry, *Water treatment, Aqueous solutions, Chemical interactions, Hydrogen ion concentration.

The formation of polynuclear hydrolysis products of aluminum(III) involves reactions with two consecutive stages, a relatively rapid reaction followed by a slow reaction in which the hydrolysis products undergo subtle changes in chemical and physical form. The rapid part of the hydrolysis reaction was examined because it is this part of the process that is most important in understanding the action of aluminum salt coagulants in engineered systems. Successive titrations with base and acid using one solution yielded evidence that the relatively sharp transition to higher OH/Al values at a pH of about 6 may be caused, in part, by the formation of a relatively stable dispersion of a polynuclear species with OH/Al in the range of 2.5 +/-3. Surface or edge site deprotonation of this species can be used to explain the OH/Al versus pH curve above pH 6. Destabilization of a polynuclear species by charge reduction through surface site deprotonation may control the formation of the visible aluminum hydroxide precipitate at pH > 6.5. The species/precipitate with OH/Al > 2.5 dissolves very slowly with acid addition. Dissolution occurred at a pH (4.9) which was significantly lower than the pH at which the species was formed and lower than the pH at which it apparently had aggregated to form the precipitate. SURFACE IONIZATION OF POLYNUCLEAR SPECIES IN AL(III) HYDROLYSIS--II. A CONDITIONAL EQUILIBRIUM MODEL.
Syracuse Univ., NY. Dept. of Civil and Environmental Engineering.
R. D. Letterman, and S. R. Asolekar.
Water Research WATRAG, Vol. 24, No. 8, p 941-948, August 1990. 8 fig, 2 tab, 15 ref. National Science Foundation grant no. CEE-8315971.

Descriptors: *Aluminum, *Chemical reactions, *Coagulants, *Hydrolysis, *Metals, *Model studies, *Water chemistry, *Water treatment, Aqueous solutions, Chemical interactions, Equilibrium models, Hydrogen ion concentration, Kinetics.

The inclusion of reactions for the titration of edge or surface sites on polynuclear Al species can be used to improve the ability of a conditional equilibrium model of Al hydrolysis to predict the molar ratio of metal bound hydroxide ion to total metal concentration as a function of pH. Base and acid titrations of aluminum salt solutions were modeled by including in the reaction scheme the titration of protons from ionizable surface (or edge) sites on polynuclear species and the charged precipitate. It was assumed that the OH/Al ratio of the polynuclear species consists of a structural part, the hydroxide ions that link the Al ions, and a more labile surface site titration part. The hydrolysis products included in the best-fit reaction scheme are two monomeric species, Al(OH)(2+) and Al(OH)4(-), and two polynuclear species Al14(OH)32(10+) and Alp(OH)q(3p-q)(+) where (q/p) = 2.7 (q/p is the molar ratio of the structural hydroxide ion to aluminium in the polynuclear species). The precipitate is assumed to consist of aggregates of the larger polynuclear species destablized by surface site deprotonation. The fitted solubility product (pKsp) for acid titration was -9.8, suggesting a significant kinetic difference between precipitate formation and dissolution. (See also W91-01413) (Mertz-PTT)

GENESIS OF FREE HYDRAULIC JUMPS FOR BETTER MIXING.
Roorkee Univ. (India). Dept. of Civil Engineering.
D. S. Bhargava, and C. S. P. Ojha.
Water Research WATRAG, Vol. 24, No. 8, p 1003-1010, August 1990. 4 fig, 3 tab, 5 ref, append.

Descriptors: *Hydraulic jump, *Hydraulics, *Mixing, *Water treatment, Channels, Coagulants, Model studies.

Free hydraulic jumps are frequently used in water treatment for mixing processes. Additions of coagulant doses in such a jump would result in a very thorough mixing of the chemical and in efficient dispersion in the entire body of the water to be treated. Such a mode of mixing is most desirable in situations where there is a power shortage or the supply is unreliable, as is currently the case in India. Analysis of the hydraulic jumps was carried out to determine the factors that are responsible for a very thorough and efficient mixing and dispersion of the coagulants. A free hydraulic jump design (which is considered to provide greater energy loss and thus a better mixing in comparison to the submerged jump) was examined for various discharge rates in the 0.1 to 5 cubic m/second range maintaining the desired depth to width ratio in the downstream channel. The free hydraulic jump was created by regulating the flume gates in a rectangular flume of 0.3 m width, 0.5 m depth

LIBRARY U. OF I. URBANA-CHAMPAIGN

and 7 m length. Increased mixing length corresponds to a lower standard deviation, which is expected, because at longer distances mixing improves. When the chemical was injected at the corner of the channel, the mixing length was greater than when injected at a central channel site. The addition of chemicals on the upstream side of the jump results in an insignificant saving of the effective mixing length. The effective mixing distance is always more than the jump length. This means that the downstream length of the free hydraulic jump channel should be about the length of the free hydraulic jump. When the discharge decreases by a factor of three, the effective mixing distance decreases only 1.25 times. This ensures a shorter effective mixing distance at the minimum flow for a designed channel. (Mertz-PTT)

LITHIUM IN DRINKING WATER AND THE INCIDENCES OF CRIMES, SUICIDES, AND ARRESTS RELATED TO DRUG ADDICTIONS.
California Univ., San Diego, La Jolla. Dept. of Chemistry.
G. N. Schrauzer, and K. P. Shrestha.
Biological Trace Element Research BTERDG, Vol. 25, No. 2, p 105-113, May 1990. 3 tab, 20 ref.

Descriptors: *Behavior, *Drinking water, *Lithium, *Public health, *Trace elements, Biochemistry, Environmental effects, Water quality control, Water quality management, Water quality standards.

Lithium is a trace element that is widely used in the treatment of various mental disorders. Previous studies have compared the lithium concentrations in the regional drinking water supplies with the incidence of mental disorders and homicide rates in Texas and found a statistically significant inverse relationship. Since incidence data for only two years (1967-1969) were used in the studies, the relationships between drinking water lithium with homicide and suicide rates were reinvestigated for 10 years (1978-1987) and extended to other crimes, arrests for possession of opium, cocaine, and their derivatives, and possession of marijuana, as well as arrests for drunkenness (1981-1986). Using data for 27 Texas counties it was shown that the incidence rates of suicide, homicide, rape, robbery, burglary, and theft are significantly higher in counties whose drinking water supplies contain little or no lithium than in counties with water lithium levels ranging from 70-170 micrograms/L. These results suggest that lithium has moderating effects on suicidal and violent criminal behavior at levels that may be encountered in municipal water supplies. Comparisons of drinking water lithium levels with the incidences of arrests for possession of opium, cocaine, and their derivatives also produced statistically significant inverse associations, whereas no significant or consistent associations were observed with possession of marijuana and drunkenness. These results suggest that lithium at low dosage levels has a beneficial effect on human behavior. Lithiation of drinking water is suggested as a possible means of crime, suicide, and drug-dependency reduction at the individual and community level. (Author's abstract)

MODEL FOR WATER DISTRIBUTION SYSTEM RELIABILITY.
Texas Univ. at Austin. Dept. of Civil Engineering.
Y. Bao, and L. W. Mays.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 9, p 1119-1137, September 1990. 11 fig, 4 tab, 23 ref. National Science Foundation Project Assessment of Aging Water Distribution Systems Grant No. ECE-8511399.

Descriptors: *Model studies, *Simulation analysis, *Water conveyance, *Water distribution, Flow rates, Monte Carlo method, Pipelines, Pipes, Pressure head, Uncertainty, Water demand.

The hydraulic reliability of a water distribution system can be defined as the probability that the system can provide the demanded flow rate at the required pressure head. Due to the random nature of future water demands, required pressure heads, and pipe roughness, the estimation of water distribution system reliability for the future is subject to uncertainty. A methodology has been developed to estimate the nodal and system hydraulic reliabilities of water distribution systems that accounts for these uncertainties. The framework for the methodology is based upon a Monte Carlo simulation consisting of three major components: random number generation, hydraulic network simulation, and computation of reliability. This method was applied successfully to an example water distribution system consisting of 17 pipes and 12 demand nodes. It was determined that this new methodology can be used in the analysis or expansion of existing systems, or the design of new systems. (Author's abstract)

IMPLEMENTATION OF ON-LINE CONTROL SCHEME FOR CITY WATER SYSTEM.
Leicester Polytechnic (England). Water Control Unit.
C.-H. Orr, M. A. Parkar, and S. T. Tennant.
Journal of Water Resources Planning and Management (ASCE) JWRMD5, Vol. 116, No. 5, p 708-726, September/October 1990. 5 fig, 11 ref.

Descriptors: *Computer models, *Control systems, *Data acquisition, *Metropolitan water management, *Water resources management, Cost-benefit analysis, Data transmission, England, Monitoring, Pumping, Urban planning, Water demand, Water distribution, Water resources data, Water supply.

The provision of on-line computer-based control schemes for water supply and distribution systems has for many years eluded the water industry because of the unavailability of reliable applications modules, as well as the limitations on computing power. Recent technological advances, however, have enabled the development and implementation of one such scheme for a major city (Severn-Trent Water) network in the United Kingdom. Specific objectives for such an on-line control implementation include demand prediction based upon predicted demand consumption, management of all the on-line data, coordination of the real-time activities, monitoring of all major system data, generation of appropriate alarm messages and signals, and advice on regulatory decisions during the control period. Preliminary results from the implementation are encouraging. Confidence has increased about the reliability of predicted demand; under normal operation, accuracy is about 5% for the daily average and 10% for the instantaneous values. This has led in turn to increased confidence in the optimality of pump schedules, which on application have led to reduced operational costs. A typical 15% cost saving has been reported, with occasional savings of up to 27%. System monitoring has proved to be of vital importance, giving early warnings of unexpectedly high and low demands, reservoir levels, pump failures, and other unpredictable events. Major improvements through savings in operational costs and provision of system monitoring and regulation facilities have resulted. The cost benefits and improved efficiency have greatly offset the costs of development of such a scheme. (Fish-PTT)

INACTIVATION OF LEGIONELLA PNEUMOPHILA BY POTASSIUM PERMANGANATE.
Arizona Univ., Tucson. Dept. of Microbiology and Immunology.
M. T. Yahya, L. K. Landeen, and C. P. Gerba.
Environmental Technology ETLEDB, Vol. 11, No. 7, p 657-662, 1990. 3 tab, 3 fig, 11 ref.

Descriptors: *Disinfection, *Legionella, *Pathogenic bacteria, *Potassium permanganate, *Water treatment, Chlorination, Hydrogen ion concentration, Microorganisms, Water quality standards.

Effective disinfection of water is essential in order to limit disease transmission. Chlorine, the most popular water disinfectant since the turn of the century, has been found to be effective and economical. However, in the early 1970's, chlorination was found to contribute to the formation of numerous chlorinated organic compounds in water. Potassium permanganate (KMnO4), another oxidant, has been used to treat drinking water for almost 100 years. Although potassium permanganate is not currently being used as a primary disinfectant, water systems that use it in the pre-treatment stages of disinfection might benefit from its broad antimicrobial properties and thereby reduce the amount of chlorine needed in the final treatment. Potassium permanganate was investigated for its ability to inactivate cultures of agar-grown Legionella pneumophila in a phosphate buffer (pH 6.0 and pH 8.0) at 7 C. The results of these experiments demonstrate that the efficacy of potassium permanganate is pH-dependent. Greater bacterial rates of inactivation were achieved at the lower pH values. At pH 6.0, significantly higher inactivation rates, k values, (0.300 log 10 reduction/min) of L. pneumophila were observed compared to those at pH 8.0 (0.032 log 10 reduction/min). By exposure to 5.0 mg/L KMnO4, more than a 99% (2 log 10 cfu/mL) reduction in the bacterial numbers was achieved within 10 minutes at a pH of 6.0. However, at pH 8.0, at least 60 minutes was required for a 99% reduction. KMnO4 was significantly more effective at 5.0 mg/L compared to 2.5 and 1.0 mg/L. Water systems with KMnO4 may gain disinfection credits as proposed by the EPA. (Korn-PTT)

OCCURRENCE OF THE MUTAGENIC COMPOUND MX IN DRINKING WATER AND ITS REMOVAL BY ACTIVATED CARBON.
Alberta Univ., Edmonton. Dept. of Civil Engineering.
R. C. Andrews, S. A. Daignault, C. Laverdure, D. T. Williams, and P. M. Huck.
Environmental Technology ETLEDB, Vol. 11, No. 7, p 685-694, 1990. 6 fig, 3 tab, 21 ref. Health and Welfare Canada (Supply and Services) Contract Nr. H4001-8-N001/01-SS.

Descriptors: *Activated carbon, *Drinking water, *Halogenated compounds, *Mutagenicity, *Water treatment, *Water treatment facilities, Canada, Chlorination, Comparison studies, Organic carbon.

Within the last several years the compound MX (3-chloro-4-dichloromethyl-5-hydroxy-2(5H)-furanone) has been shown to be responsible for up to 57% of the acid fraction mutagenicity observed in chlorinated drinking waters. In aqueous solution, MX can undergo isomerization to an open form known as EMX (E-2-chloro-3-dichloromethyl-4-oxobutenoic acid) which is a weaker mutagen. The use of granular activated carbon (GAC) has been demonstrated to be an effective means of removing mutagenic compounds produced during chlorination of drinking water and as such could be a useful treatment to remove MX. To examine the extent to which MX and EMX are formed in conventional water treatment employing chlorination, and to quantify the removal capacity of GAC for MX, samples were collected from six Canadian water treatment plants. Laboratory investigations showed the strongly mutagenic compound MX to be very well removed by activated carbon over a wide concentration range. Samples obtained from two water treatment plants following pre-chlorination showed MX to be present in the range of 38 to 60 ng/L. MX concentrations were not always correlated with total organic carbon (TOC) levels, suggesting that the type of organic matter present may play a role in MX formation. Granulated activated (GAC) appeared to be capable of removing MX precursors. (Korn-PTT)

INHIBITION OF GROWTH OF LEGIONELLA SPECIES BY HETEROTROPHIC PLATE COUNT BACTERIA ISOLATED FROM CHLORINATED DRINKING WATER.
Queensland Univ., Brisbane (Australia). Dept. of Microbiology.

S. Toze, L. I. Sly, I. C. MacRae, and J. A. Fuerst.
Current Microbiology CUMIDD, Vol. 21, No. 2, p 139-143, August 1990. 3 tab, 23 ref.

Descriptors: *Domestic water, *Legionella, *Water quality control, *Water treatment, Amino acids, Bacteria, Chlorination, Drinking water, Growth rates, Heterotrophic bacteria.

Legionella is a nutritionally fastidious bacterium requiring amino acids as the source of energy. A suggested mode of survival in the environment is by the interaction of the Legionella cells with non-Legionella bacteria. The ability of heterotrophic plate count bacterial strains isolated from chlorinated drinking water on low-nutrient media to inhibit the growth of Legionella species was examined. Between 16% and 32% of these strains were able to inhibit the growth of Legionella species when tested on buffered charcoal yeast extract agar. The exact proportion of inhibiting strains varied with the individual Legionella species. Two strains that inhibited the growth of several Legionella species could also stimulate the growth of the same species when both the test strain and the Legionella species were grown on buffered charcoal yeast extract agar that lacked the essential amino acid L-cysteine. LACK OF EFFECT OF DRINKING WATER BARIUM ON CARDIOVASCULAR RISK FACTORS.
Cincinnati Univ., OH. Coll. of Medicine.
R. G. Wones, B. L. Stadler, and L. A. Frohman.
Environmental Health Perspectives EVHPAZ, Vol. 85, p 355-359, April 1990. 1 fig, 1 tab, 24 ref. PHS Grant No. RR00068 and EPA Cooperative Agreement No. CR-812560.

Descriptors: *Barium, *Cardiovascular disease, *Drinking water, *Human diseases, *Water pollution effects, Epidemiology, Standards.

Higher cardiovascular mortality has been associated in a single epidemiological study with higher levels of barium in drinking water. Drinking water barium at levels found in some U.S. communities was studied to determine the effect on known risk factors for cardiovascular disease. Eleven healthy men completed a 10-week-dose-response protocol in which diet was controlled (600 mg cholesterol; 40% fat, 40% carbohydrate, 20% protein; sodium and potassium controlled at the subject's pre-protocol estimated intake). Other aspects of the subjects' lifestyles known to affect cardiac risk factors were controlled, and the barium content (as barium chloride) of the drinking water (1.5 L/day) was varied from 0 (first 2 weeks), to 5 ppm (next 4 weeks), to 10 ppm (last 4 weeks). Multiple blood and urine samples, morning and evening blood pressure measurements, and 48-hr electrocardiograph monitoring were performed at each dose of barium. There were no changes in morning or evening systolic or diastolic blood pressures, plasma cholesterol or lipoprotein or apolipoprotein levels, serum potassium or glucose levels, or urine catecholamine levels. There were no arrhythmias related to barium exposure detected on continuous electrocardiographic monitoring. A trend was seen toward increased total serum calcium levels with exposure to barium, which was of borderline statistical significance and of doubtful clinical significance. Drinking water barium at levels of 5 and 10 ppm did not appear to affect any of the known modifiable cardiovascular risk factors. (Author's abstract)

FORMATION OF PCDDS AND PCDFS BY THE CHLORINATION OF WATER.
Umea Univ. (Sweden). Inst. of Environmental Chemistry.
C. Rappe, S. E. Swanson, B. Glas, K. P. Kringstad, and P. deSousa.
Chemosphere CMSHAF, Vol. 19, No. 12, p 1875-1880, 1989. 2 fig, 1 tab, 11 ref.

Descriptors: *Chlorination, *Dioxins, *Disinfection, *Polychlorinated biphenyls, *Wastewater treatment, *Water pollution sources, *Water treatment, Analytical methods, Drinking water, Pollutant identification, Pulp and paper industry.

Two samples of tap water and double distilled water were chlorinated using chlorine gas. A series of polychlorinated dibenzofurans (PCDFs) could be identified from these experiments, however no dibenzo-p-dioxins (PCDDs) could be found. Differences were found in the congener profiles between the two water samples that could not be explained. The two water samples gave very similar isomeric patterns (e.g. tetra-CDFs). The three dominating isomers among the tetra-CDFs are the 2,3,7,8-, 1,2,7,8-, and 1,2,8,9-isomers; the same isomers that are found in the bleached pulp and paper products, the 'bleaching pattern'. The observation that PCDFs are formed by the reaction of chlorine with double distilled water indicate that the PCDFs or their precursors are present in the chlorine gas. Consequently all the products formed by chlorination reactions are potentially contaminated by PCDFs. The pattern identified in this study is called the 'chlorine pattern'. For the tetra-CDFs it consists of the same isomers as the 'pulp bleaching pattern', however, the 'chlorine pattern' also contains higher chlorinated PCDFs, but no PCDDs. (Agostine-PTT)

MEASURING THE PRODUCTIVITY OF CONSTRUCTION MAINTENANCE OPERATIONS.
Rutgers - The State Univ., Piscataway, NJ. Dept. of Industrial Engineering.
J. T. Luxhoj, and P.-C. Tao.
Journal of the American Water Works Association JAWWA5, Vol. 82, No. 8, p 35-39, August 1990. 3 fig, 6 tab.

Descriptors: *Construction, *Maintenance, *Metropolitan water management, *Performance evaluation, *Productivity, *Utilities, *Water treatment, Model studies, Personnel management.

A measurement system for evaluating and controlling a water utility's maintenance activities was developed. The system involves the development of models to graphically describe and measure the work content of the various jobs. The first set of models, which focuses on task descriptions, comprises the construction measurement system. The second set of models comprises the performance measurement system and is developed at the department level to measure labor productivity. The construction and performance measurement system is currently in place at Hackensack Water Company. During the first six months of 1989, a 20 percent productivity gain was reported over the same period in 1988. During the first half of 1989, 300 more jobs were completed and 650 fewer worker hours were expended than during the same period in 1988. The backlog index was reduced to 2.4 from 4.0. Although it is not clear at this point how much of the productivity improvement can be directly attributed to the measurement system, it is reasonable to conclude that such a measurement system has significantly increased the productivity consciousness of the organization. OPERATOR EVALUATION OF SMALL SYSTEMS.
Chautauqua County Dept. of Health, Mayville, NY. Div. of Environmental Health Services.
W. D. Gollnitz, and B. Kittle.
Journal of the American Water Works Association JAWWA5, Vol. 82, No. 8, p 40-45, August 1990. 3 fig, 1 tab, 13 ref.

Descriptors: *Operating policies, *Performance evaluation, *Water treatment, *Water treatment facilities, Case studies, Clarifiers, Evaluation, Particulate matter, Turbidity, Water quality standards.

Many of the small water treatment systems built before 1960 are having difficulty meeting current water quality regulations, especially with respect to particle reduction (measured as finished-water turbidity). Preliminary evaluations of small surface water treatment systems can and should be performed by system managers and operators before a consulting engineer is hired. System evaluations can be aided by conducting literature searches at local libraries and universities to get a better understanding of the potential problem facing the utility, by reviewing and comparing the design of the treatment system in question with those of neighboring systems treating water of similar quality, by performing system simulations using models of varying complexity, and by conducting evaluations in the treatment plant using different coagulants and coagulant aids. A case study of a water treatment plant in Westfield, N.Y. is described in which the simulation techniques are demonstrated. For the facility to meet the current and proposed turbidity maximum contaminant levels, the existing clarifier must be modified by adding tube settlers or by adding an additional clarification unit. MEASURING AND MODELING VARIATIONS IN DISTRIBUTION SYSTEM WATER QUALITY.
Environmental Protection Agency, Cincinnati, OH. Drinking Water Research Div.
R. M. Clark, and J. A. Coyle.
Journal of the American Water Works Association JAWWA5, Vol. 82, No. 8, p 46-53, August 1990. 6 fig, 36 ref.

Descriptors: *Model studies, *Water distribution, *Water quality management, *Water sampling, *Water treatment, Flow pattern, Hydraulics, Monitoring, Pennsylvania.

The effects of hydraulic mixing on water quality variations in a distribution system were examined. The study, which was conducted at the North Penn Water Authority, Lansdale, Pennsylvania, (average production of 5 mgd and 225 mi of distribution pipe), incorporated a field sampling program that utilized customized automated samplers designed to prevent loss of volatile constituents. As a complement to the field sampling program, computer models that would predict water quality variations in distribution systems were examined and developed. A clear need was shown for obtaining more representative monitoring results than are normally acquired from distribution system sampling. It is concluded that steady-state predictive modeling of water quality can provide insight into overall water quality variations and patterns within a distribution system. Interpretation of predictive modeling results must be made in light of an appreciation of system hydraulics, in particular an understanding of the flow patterns and directions that create the gradients of concentration. FLOCCULATION IN TURBULENT FLOW: MEASUREMENT AND MODELING OF PARTICLE SIZE DISTRIBUTIONS.
Pittsburgh Univ., PA. Dept. of Civil Engineering.
L. W. Casson, and D. F. Lawler.
Journal of the American Water Works Association JAWWA5, Vol. 82, No. 8, p 54-68, August 1990. 15 fig, 21 ref. NSF Presidential Young Investigator Grant CES 8451135.

Descriptors: *Flocculation, *Model studies, *Particle size, *Turbulent flow, *Water treatment, Eddies, Mixing, Statistical analysis, Suspension, Velocity, Water quality.

Fluid motion in an oscillating-grid flocculator was investigated quantitatively with a laser Doppler velocimeter for two mixing conditions. Batch flocculation experiments were performed for monodisperse, bimodal, and trimodal latex suspensions. The effects of mixing intensity, particle charge, and suspension concentration on the rate of change in particle size distributions were studied. Experimen-

LIBRARY U. OF I. URBANA CHAMPAIGN

tal results indicated that large eddies are relatively unimportant for flocculation and that flocculation is induced by eddies of approximately the same size as the particles. A method for estimating the velocity gradients in eddies of different sizes in the flow was developed and incorporated into an existing mathematical model for flocculation. The predictions of the revised flocculation model were compared with the experimental results and indicated that the velocity gradients of the eddies adequately describe the interparticle contacts resulting from mixing during flocculation. INFLUENCE OF OZONATED NATURAL ORGANIC MATTER ON THE BIODEGRADATION OF A MICROPOLLUTANT IN A GAC BED.
Weston (Roy F.), Inc., Valhalla, NY.
J. E. DeWaters, and F. A. DiGiano.
Journal of the American Water Works Association JAWWA5, Vol. 82, No. 8, p 69-75, August 1990. 7 fig, 1 tab, 23 ref. NSF Grant ECE-8520483.

Descriptors: *Activated carbon, *Biodegradation, *Granular activated carbon, *Organic matter, *Ozonation, *Water treatment, Biofilms, Industrial wastes, Pollutants, Sorption.

Biological activity on granular activated carbon (GAC) may significantly enhance the treatment process. Shifting the pathway for contaminant removal from adsorption to biodegradation reduces biodegradable organics and increases sorptive capacity for non-degradable or slowly degradable compounds. Biodegradation and adsorption of natural organic matter (NOM) were studied in a laboratory-scale GAC reactor. Investigations were done under controlled laboratory conditions in which feed concentration and empty bed contact time (EBCT) could be varied and a synthetic organic chemical (SOC) could be introduced. Ozonation of the NOM used in this research at a dose of 1 mg O3/mg TOC (total organic carbon) increased biodegradation and encouraged biofilm growth in the GAC bed. Substantial steady-state reductions in TOC were achieved within a relatively short EBCT in the presence of this actively growing biofilm. Significant removal of organic matter within a short EBCT implies that biological activity has the potential for reducing the necessary size of a GAC facility, thereby reducing capital costs. Biofilm grown on ozonated NOM readily degraded trace concentrations of phenol. It is concluded that the biological activity provided by a readily available substrate (ozonated NOM) can effectively remove not only the bulk substrate but trace synthetic organics as well. EFFECTS OF OZONE ON THE INFECTIVITY OF HEPATITIS A VIRUS.
New England Univ., Biddeford, ME. Dept. of Microbiology.
J. M. Vaughn, Y. S. Chen, J. F. Novotny, and D. Strout.
Canadian Journal of Microbiology CJMIAZ, Vol. 36, No. 8, p 557-560, August 1990. 1 fig, 1 tab, 34 ref. EPA Grant R-812140-01.

Descriptors: *Disinfection, *Enteroviruses, *Hydrogen ion concentration, *Infection, *Ozone, Disinfectants, Human pathogens, Immunoassay, Water treatment.

The inactivation of a large-focus-forming variant of hepatitis A virus (HM-175) by ozone was investigated as an alternative to chlorine for the disinfection of water and wastewater. Experiments using mainly single-particle virus preparations suspended in phosphate-carbonate buffer were conducted over a range of pH levels (6-8) at 4 C. Viral enumerations involved the use of a radioimmunofocus assay. While some tolerance to lower (i.e., 0.1-0.5 mg/L) ozone residuals was noted, the exposure of virus particles to ozone concentrations of 1 mg/L or greater at all pH levels resulted in their complete (5 log) inactivation within 60 seconds. The pH-related effects that were observed were not considered to be significant. (Author's abstract)

DETERMINATION OF VOLATILE ORGANICS IN DRINKING WATER WITH USEPA METHOD 524.2 AND THE ION TRAP DETECTOR.
Environmental Monitoring Systems Lab., Cincinnati, OH.
J. W. Eichelberger, T. A. Bellar, J. P. Donnelly, and W. L. Budde.
Journal of Chromatographic Science JCHSBZ, Vol. 28, No. 9, p 460-467, September 1990. 9 fig, 3 tab, 9 ref.

Descriptors: *Drinking water, *Ion trap detector, *Laboratory methods, *Pollutant identification, *Volatile organic compounds, *Water treatment, Chemical analysis, Mass spectrometry, Maximum contaminant levels, Measuring instruments, Monitoring.

New drinking water regulations require the monitoring of eight volatile organic compounds that have established maximum contaminant levels (MCLs), and 51 other volatile organics for which MCLs are not established. A laboratory analytical method (method 524.2) for the determination of 58 of these compounds is investigated which uses: a standard inert gas purge extraction; isolation of the volatile organics on a three stage solid-phase trap; thermal desorption into a gas chromatograph; separation with the fused silica capillary column; and identification and measurement with a relatively low cost, bench-top ion trap detector that functions as a mass spectrometer. At a concentration of 2 micrograms/L (2 ppb), the grand mean measurement accuracy for 54 compounds was 95% of the true value with a mean relative standard deviation (RSD) of 4%. At 0.2 micrograms/L (200 parts per trillion), the grand mean measurement accuracy was 95% of the true value with a mean RSD of 3%. (Author's abstract)

MODELING LINKED WATERSHED AND LAKE PROCESSES FOR WATER QUALITY MANAGEMENT DECISIONS.
Agricultural Research Service, Durant, OK.
R. M. Summer, C. V. Alonso, and R. A. Young.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 421-427, July/September 1990. 9 fig, 2 tab, 26 ref.

Descriptors: *Computer models, *Lake management, *Limnology, *Management planning, *Minnesota, *Model studies, *Water quality management, *Watershed management, Decision making, Land use, Physical models, Simulation analysis.

A physically based modeling approach is used to link watershed with lake processes and to simulate their responses to land management and weather conditions. Components of the watershed model, AGNPS (agricultural non-point source model) are hydrology, erosion, sediment transport, transport of nitrogen and phosphorus, and chemical oxygen demand. Runoff, sediment, and chemical variables from the watershed were used to provide input to a lake model with a cellular structure. This one-dimensional model of water bodies simulates temperature stratification, mixing by wind, sedimentation, inflow density current, and algal growth. Unsteady advection-diffusion equations characterize the dynamics of suspended sediment, soluble and sediment-attached N and P, and chlorophyll. This model, AGNPS-LAKE, is driven by random generation of weather conditions on a daily basis. Resulting impacts of alternative management plans were simulated by changing agricultural practices and land use, thereby modifying inflow characteristics to a lake. Modeling capabilities are being tested on eutrophic lakes in Minnesota for the purpose of simulating long-term trends and impacts of best management practices. (Author's abstract)

ASSESSMENT OF MANAGEMENT PRACTICES FOR REDUCING PESTICIDE RUNOFF FROM SLOPING CROPLAND IN ILLINOIS.
Illinois Natural History Survey, Champaign.
A. S. Felsot, J. K. Mitchell, and A. L. Kenimer.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 539-545, July/September 1990. 2 fig, 7 tab, 49 ref. North Central Regional Pesticide Impact Assessment Program Grant ILLU-12-0214, University of Illinois Water Resources Center Grant G1015-02, Southern Regional Research Project S-218.

Descriptors: *Agricultural practices, *Agricultural runoff, *Illinois, *Path of pollutants, *Pesticides, *Water pollution, *Water pollution control, *Water pollution prevention, Adsorption, Alachlor, Carbofuran, Conservation, Contour terracing, Cultivation, Sediment contamination, Simulated rainfall, Slopes, Soil contamination, Surface runoff, Terbufos, Tillage, Transport.

The influence of tillage system and contouring practice on runoff of soil-applied alachlor, carbofuran, and terbufos from small plots (30 sq m) were studied using a rainfall simulator. Plots were planted in corn (Zea mays L.) in 1983, soybean (Glycine max (L.) Merr.) in 1984, and corn in 1985. Runoff was measured during a 60 min event with a rainfall intensity of 63 mm/h. During 1984, moldboard-plowed and no-till systems were studied with rows oriented on the contour or up-and-down slope (7-11% slope). Compared to moldboard-plow, up-and-down slope no-till and contouring significantly reduced runoff of carbofuran and alachlor. Percentage of applied carbofuran lost in runoff and sediment ranged from 1% (contoured moldboard) to 11% (up-and-down slope moldboard). Percentage of alachlor lost ranged from 1% (contoured no-till) to 2% (contoured moldboard). During 1985, the effects of row orientation were evaluated on moldboard-plow, chisel-plow, ridge-tip, strip-till, and no-till systems. Under up-and-down slope conditions, runoff of alachlor and terbufos plus two metabolites (terbufos sulfoxide and terbufos sulfone) was significantly reduced by strip-till (<1% loss) compared to moldboard-plow (6% loss). With contouring, ridge tillage also was effective in reducing pesticide runoff (<1% of applied pesticide), and strip-till held losses to <0.1%. Alachlor and carbofuran were translocated from plots largely in moving water, but terbufos and metabolites were recovered mainly in eroded sediment. Although no conservation tillage system completely eliminated pesticide runoff, losses were most effectively minimized by contoured strip-till and no-till, which controlled both water and sediment movement. ERSANI V. EPA: TOWARD A PLAUSIBLE TERPRETATION OF THE 404(B)(1) GUIDE-NES FOR EVALUATING PERMIT APPLICA-ONS FOR WETLAND DEVELOPMENT.
Wendel.
olumbia Journal of Environmental Law ELE8, Vol. 15, No. 1, p 99-119, 1990.

escriptors: *Conservation, *Environmental pro-ction, *Judicial decisions, *Legal aspects, *Mas-chusetts, *Resource management, *Wetlands, rmits, Public rights, Zoning.

e rapid destruction of the wetland wealth of the ited States that began with European settlement ntinues despite the enactment of a federal law to event it. One recent case is Bersani v. EPA, a cond Circuit decision that spared from develop-nt a red maple swamp in Massachusetts. Bersani olved the Environmental Protection Agency's o of a permit to fill a wetland area on the unds that an alternative was available when the veloper entered the market for a site. The devel-er claimed that the relevant time for consider-on of whether alternative sites were available to was when he applied for a permit rather than en he entered the market in search of a site. The ny Corps of Engineers (as apparent enforcer of law) approach to the balance embodied in the delines between the developer's interest and the ial interest in wetland values can be described a private interest approach, characterized by ee elements: treatment of the alternatives analy-as the central provision of the guidelines; char-erization of alternatives as practicable or not cticable based upon the absolute size of the loss prospective profits entailed by the alternative; approval of a permit to develop when no cticable alternative is deemed to exist. The delines are meant to implement Section 404's nt as a wetland protection law. Bersani v. EPA es closer to implementing a social cost-benefit ysis and activating the incentive mechanism essary to perform an alternatives analysis than prior decisions of the Corps and the courts. The ng issue of the alternatives analysis of the b)(1) guidelines fails to focus on any of the ria crucial to determining the availability of ticable alternatives to a developer's proposed and site. It is hoped that the positive move-t taken by the case toward protecting society's ng interests in wetlands will be continued and lerated in future court review of wetland nit determination. MMING THE TIDE OF MARINE DEBRIS LLUTION: PUTTING DOMESTIC AND ERNATIONAL CONTROL AUTHORITIES WORK.
ins Coie, Washington, DC.
. Baur, and S. Iudicello.
ogy Law Quarterly ECLQAR, Vol. 17, No. 1, 142, 1990.

riptors: *International law, *Marine pollution, lic participation, *Solid waste disposal, ter pollution control, Degradation, Jurisdic-Public rights, Recycling.

Oceans and coastal seas have long been used as receptacles for all kinds of waste materials. Once the scope and impacts of persistent marine debris pollution became apparent, political institutions responded quickly. Annex V of the International Convention for the Prevention of Pollution from Ships Protocol entered into force after nine years of delay, and Congress enacted tough marine pollution control laws, including the Marine Plastic Pollution Research and Control Act. Lasting success in reducing marine debris depends primarily on translating current public awareness of the marine debris problem into modifications of the way people conduct their everyday activities. Ways to change this attitude and thus to lessen the impact of commonly pursued waste disposal activities on the marine environment include source reduction, recycling, and the judicious use of environmentally safe degradable material. All three ways call for instillation of public understanding of the problems presented by solid waste disposal practices in the vicinity of the ocean and coastal areas. Public education is central to capitalizing on public concern for the marine environment. Over time, however, institutional mechanisms will be needed to sustain this concern and force action. Incentives can be marshalled to encourage recycling, source reduction, and the use of degradable materials. Command and control authorities can mandate waste restrictions and other useful measures. Prompt and thorough action can keep beaches and waters free of debris long after washups of medical waste and plastic trash have become a distant memory. (Brunone-PTT)

EPA'S PESTICIDES-IN-GROUNDWATER STRATEGY: AGENCY ACTION IN THE FACE OF CONGRESSIONAL INACTION.
R. J. Sater.
Ecology Law Quarterly ECLQAR, Vol. 17, No. 2, p 143-177, 1990.

Descriptors: *Cleanup operations, *Contamination, *Environmental protection, *Groundwater pollution, *Pesticides, Agriculture, Aldicarb, Clean Water Act, Comprehensive Environmental Response Com, Dibromochloropropane, Drinking water, Federal Insecticide Fungicide and Rodent, Regulations, Safe Drinking Water Act, Wells.

Until a decade ago, contamination of groundwater by pesticides was not considered a serious health or environmental threat. This belief was shattered in 1979 when the pesticide dibromochloropropane (DBCP) was found in nearly 2500 wells and municipal drinking water systems in California, and aldicarb was found in wells in New York. In both cases, pesticides had entered the water supply through approved agricultural uses, not accidental spills or leaks. The EPA now considers pesticide contamination of groundwater a serious threat, and has developed its own regulatory program to deal with the problem: Agricultural Chemicals in Groundwater: Proposed Pesticide Strategy. The Pesticide Strategy develops a regulatory system that uses a combination of state pesticide management plans and federal groundwater quality standards (the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), the Federal Water Pollution Control Act (Clean Water Act or CWA), the Safe Drinking Water Act (SDWA) and the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA))to control pesticide contamination of groundwater. In theory, the EPA's Pesticide Strategy's pesticide-specific and site-specific approach leads to an exact fit between regulation and regulatory need, minimizing both underregulation and overregulation. In practice, however, the fine-tuned regulation demands state resources and political support for plan development, monitoring, and enforcement. A more sound approach to pesticide contamination of groundwater would be FIFRA's national cancellation for pesticides that pose significant health and environmental risks. National cancellation ensures the protection of groundwater, while compensating for the inefficiency of overregulation by reducing groundwater sites requiring public or private cleanup efforts. Although the Pesticide Strategy may ultimately fail, EPA's experience with it will provide many lessons for policymakers trying to respond to complex environmental problems. (Brunone-PTT)

CLEAN WATER ACT: A GOOD BEGINNING.
L. G. Billings.
Environmental Forum ENVFEN, Vol. 7, No. 2, p 46-48, March/April 1990.

Descriptors: *Clean Water Act, *Public participation, *Water quality standards, *Zero discharge, Chemical wastes, Economic aspects, Federal jurisdiction, Pesticides, Runoff, Water pollution.

Senator Edmund Muskie channelled public outrage into the passage of the landmark 1972 Clean Water Act (CWA), which set a national goal of zero discharge of pollutants. It is brought to public attention the fact that water is not a free good and its supply is extremely limited; public drinking water drawn from wells is often unsafe; and chemical contaminants in the water supply are a basic public health threat. Runoff pollution problems has been created by the establishment of more impervious surfaces like roads and parking lots and the increased use of chemicals and pesticides. Twenty years ago, a group of politicians developed a clean water policy based on three broad goals: the biological integrity of receiving waters, the maximum use of available technology, and the ultimate goal of zero discharge. Achieving these goals depended on state authority, federal mandates, citizen suits, and public funding. The single most contentious CWA issue was whether there would be an opportunity for individual polluters to appeal clean water requirements for their particular category of facilities, and was ultimately resolved in favor of categorical effluent standards based on feasibility and cost. For approximately ten billion dollars per year, nearly three quarters of the nation's surface water now meets the national water quality standard. Significant progress has been made as a result of a federal-state partnership, federal financial aid, and federal enforcement. The Environmental Protection Agency has recently, however, been advocating source-by-source waivers, cost-based appeals, pre-cooked risk assessments, and an impossible array of pollution reduction credits, tax law-type carry-forwards and carry backs, and compliance shields designed to minimize rather than maximize federal responsibility for public health related pollution control. A potential solution to the problem of decreased accessibility of members of Congress is the development of a viable Green Party in the USA, which would refocus public attention upon the problems of pollution control and maintenance of clean water. A regional authority should use an integrated framework when assessing the potential impacts of any policy initiative directed at improving groundwater quality. A policy model was therefore developed relying on three decision components (farm-level production decisions model, a household de-

LIBRARY U. OF I. URBANA-CHAMPAIGN

cisions model, and a regional policy decision model) where the objective is one of identifying the trade-offs that a regional authority will be confronted with as it strives to balance the preferences of farmers and households while endeavoring to maximize net economic welfare. The basic rule developed indicates that the regional authority must choose a policy whereby any increase (decrease) in regional income is just equal to the decrease (increase) in net benefits to households. The model developed does require a fair amount of information on the transport and fate of pesticides and fertilizers used in the agricultural production process, dose-response relationships for computing health risks and costs associated with excessive illnesses (and mortality), costs of remedial action options etc. (Author's abstract)

ENFORCEMENT OF FEDERAL UNDERGROUND STORAGE TANK REGULATIONS.
North Carolina Univ. at Wilmington. Dept. of Philosophy.
C. C. Gauthier.
Environmental Law EVLWA8, Vol. 20, No. 2, p 261-289, 1990.

Descriptors: *Enforcement, *Leakage, *Path of pollutants, *Regulations, *Underground storage tanks, *Water pollution prevention, Biodegradation, Economic aspects, Environmental protection, Federal jurisdiction, Flushing, Groundwater pollution, Hydrocarbons, Liability, Political aspects, Soil contamination, State jurisdiction.

During the 1980s, underground storage tanks (USTs) were leaking petroleum products into the soil and groundwater at an alarming rate. In 1986, the EPA tested 433 tanks for leakage at 218 establishments in the United States and found that 35% of the storage tanks tested were leaking. These releases both damage the environment and pose serious risks to public health and safety. The federal government has recently developed an UST regulatory program that includes operating and financial responsibility requirements. Federal regulation requires UST system owners to notify state environmental agencies of the existence of these systems, and directs the EPA to formulate regulations concerning UST release detection, prevention, and corrective action, as well as for financial responsibility for leaks of regulated substances from USTs. State environmental agencies are required to compile tank inventories and to provide this information to the EPA. The EPA is mandated to establish a federal program for the regulation of USTs that allows state programs to operate in lieu of the federal program is they are no less strict than the federal requirements and can be adequately enforced. When a petroleum product is released from an underground storage tank, there is contamination of the soil, and if the release is significant, there is also contamination of the groundwater. To recover shallow spills, the contaminated soil may be excavated and placed in a landfill. For deeper pollution, the only methods of treatment are flushing and recovery or an in-situ treatment, such as biological degradation using bacteria. Ethical issues include the relationship between the public demand for petroleum products, environmental damage, and the conflicts encountered by environmental consulting firms. Legal issues concern the notification of the public and the sale of property on which storage tanks are located, as well as the increasing involvement of the legal system in enforcement of environmental legislation. GROUND-WATER PROTECTION AND RECLAMATION.
Louisiana State Univ., Baton Rouge. Dept. of Civil Engineering.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 4, p 654-662, July/August 1990. 3 tab, 14 ref.

Descriptors: *Groundwater, *Groundwater availability, *Groundwater management, *Groundwater pollution, *Water pollution prevention, *Water pollution treatment, Aquifers, Groundwater contamination, Groundwater quality, Water management, Water treatment.

A review of the status of the nation's groundwater quality and pollution problems reveals the need to be concerned for its protection and to have cleanup technologies available for existing and future contamination problems. Present U.S. federal laws are more than adequate to protect and clean up the nation's groundwaters; compliance with existing groundwater pollution prevention legislation will be most effective. While national interest in the protection and cleanup of the nation's groundwaters is well justified, panic over the current status of groundwaters quality is not. Research needs to be expanded on how to prevent substances from being released to the environment during handling, treatment, storage, or disposal with specific emphasis, in loss control, along with continued efforts to develop and refine methodologies to clean up contaminated soils and aquifers. IMMOBILIZATION MECHANISMS IN SOLIDIFICATION/STABILIZATION OF CD AND PB SALTS USING PORTLAND CEMENT FIXING AGENTS.
Louisiana State Univ., Baton Rouge. Dept. of Chemistry.
F. K. Cartledge, L. G. Butler, D. Chalasani, H. C. Eaton, and F. P. Frey.
Environmental Science and Technology ESTHAG, Vol. 24, No. 6, p 867-873, June 1990. 3 fig, 2 tab, 32 ref.

Descriptors: *Cadmium, *Lead, *Portland cements, *Solid waste disposal, *Water pollution prevention, Groundwater pollution, Land disposal, Leaching, Path of pollutants, Sludge stabilization.

Cement is often used in solidification/stabilization (S/S) treatment of hazardous heavy-metal-containing wastes that are in liquid or sludge forms to produce a solid for land disposal. Analysis of the behavior of Cd and Pb salts during cement-based solidification, using the toxicity choroeteristic leaching procedure, conduction calorimetry, and solid-state nuclear magnetic resonance, demonstrated that although the concentration of Cd in leachates is very low, the Pb concentration is much higher and represents a serious threat to groundwater. While cadmium salts, whether initially water soluble or insoluble, are effectively immobilized by the cementitious process, lead hydroxide is not. In addition, particularly with mixed waste streams, other components have been previously shown to impair optimal waste immobilization by adverse effect on strength development of the cement matrix. The combined results suggest cautionary use of cement-based solidification. (D'Agostino-PTT)

Available from the National Technical Information Service, Springfield, VA 22161, as PB89-195002. Price codes: A11 in paper copy, A01 in microfiche. October 3-4, 1988, Denver, Colorado. EPA Report No. EPA/600/9-89/001, January 1989. 233 p. Edited by C. Y. James, Ben R. Urbonas, and Thomas O. Barnwell.

Descriptors: *Management planning, *Model studies, *Storm water, *Storm water management, *Urban hydrology, *Urban runoff, *Water quality management, Computer models, Computer programs, Computers, Conferences, Data interpretation, Field tests, Hydraulic models, Mathematical models, Water quality.

Twenty-two technical papers are presented on topics related to the development and application of computer-based mathematical models for water quality and quantity management. The papers address five subject areas: revisions and modifications to EPA models, administrative concerns, applications and experiences, latest developments, and field observations and related studies. Several of the studies present critical reviews of modeling concepts, numerical approaches, and comparisons with field observations. Revisions and modifications of the EPA SWMM model are helpful in the enhancement of the model's capability and user friendliness. Although the application of computer models is the prime subject area, many other subjects, such as spreadsheet use, statistical sensitivity of measured data, AUTOCAD enhancement in data management, and mapping database application, are addressed. IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 81-91, 4 fig, 1 tab, 5 ref.

Descriptors: *Model studies, *Patuxent River, *Urban hydrology, *Urban runoff, *Water quality, *Water quality management, Aeration, Biochemical oxygen demand, Dissolved oxygen, Flow profiles, Management planning, Nitrites, Pollution load, Simulation analysis, Urban watersheds.

The Pawtuxent River flows through heavily urbanized areas, receives effluent from 3 municipal wastewater treatment facilities (WWTFs) and one industrial WWTF, and has summer dissolved oxygen (DO) concentrations well below the 5.0 mg/L standard for much of its length. Data collected during three 48 hour sampling surveys was used to calibrate and validate the QUAL-II model. A review was conducted of the model calibration and validation and it was noted that although biochemical oxygen demand (BOD) decay and nitrification rates were calculated from field data, they varied greatly among surveys for a given reach, and between adjacent reaches. To provide a more defendable wasteload allocation (WLA), the model was recalibrated and revalidated using one set of decay rates which successfully predicted the field data. The data used to revalidate the model was collected during a flow profile very close to the 7Q10 flow and alternative WLA strategies were explored using this model. Flow augmentation, instream aeration, increasing the number of outfalls, and advanced treatment (AT) simulations indicated that discharge limits of BOD 10, NH3 2 mg/L are required to attain the instream DO criteria. Seasonal limits were developed using monthly USGS flow and temperature data. When simulating AT, effluent DO concentrations were set to 6.0 mg/L and instream BOD decay and simulated

gen demand (SOD) rates were reduced. (See W91-01188) (Author's abstract)

ERSHED 89: THE FUTURE FOR WATER LITY IN EUROPE. VOLUME II.
eedings of the IAWPRC Conference held in lford, UK, 17-20 April, 1989. Pergamon New York. 1989. 521p. Edited by D. Wheel-L. Richardson, and J. Bridges.

riptors: *Europe, *Eutrophication, tewater treatment, *Water pollution control, er pollution prevention, *Water quality, al wastes, Enteric bacteria, Groundwater pol-, Models, Path of pollutants, Pesticides, Pol- identification, Potable water, Viruses, Water ion effects.

rshed 89 brought together scientists, engi- environmentalists, industrialists, academia oliticians to provide a forum for a wide range inions concerning water quality in Europe. book contains proceedings from the confer-ponsored by the Commission of the Europe-mmunities, the World Health Organization e International Association on Water Pollu-Research and Control and organized by the s Institute, University of Surrey. A declara-greed upon by conference participants states rofessionals concerned with water quality nade substantial progress since the middle of t century. New problems threatening water have resulted from significant changes in in the last forty years. Problems of mercury olychlorinated biphenyl pollution have been with, but solutions to the other problems, s pesticides, cadmium, eutrophication, enter-ses and parasites will necessitate changing f society's established practices. There is a better anticipate new problems, especially lealing with the extent to which groundwat-ll ultimately become contaminated by sol- metals or other toxic substances, thereby tating the installation of new water treat-echnologies or abandonment of sources. The nce concluded that: (1) water pollution pre- was better than having to rehabilitate pol-vaters, (2) guidelines for water quality must n seriously and enforced, (3) water quality nes must take into account the dissimilar s on human health and the ecology of flora na, (4) research must be coordinated on a l and international level, (5) each citizen of has the right to be adequately informed ning the status and trends of the environ-n relation to human health, (6) all nations ake substantial investments in human re-sources to meet the need for increased monitoring and enforcement of standards and guidelines, and (7) guidelines and regulations are important, but they do not remove the need for political choices. Q2X: AN (EXPERT) SYSTEMS APPROACH TO QUANTITY AND QUALITY MANAGEMENT OF STRATEGIC RESOURCES.
Surrey Univ., Guildford (England). Centre for Information Technology Research.
K. Ahmad.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 129-145, 15 fig, 3 tab, 10 ref.

Descriptors: *Computers, *Expert systems, *Water pollution control, *Water quality, *Water resources management, Computer programs, Management planning, Monitoring, Quality control, Water distribution, Water supply.

Expert systems methods, tools and techniques can help in the acquisition, representation and deployment of knowledge about water quality and quantity, particularly in the design and rehabilitation of sewage systems, control and monitoring of water distribution networks, and in the quality management of water supply systems. The Water Industry Expert Systems Club (WIESC) tackles problems relevant to the United Kingdom water industry. WIESC adopted two expert systems, SERPES and WADNES to handle two water quantity problems, namely the rehabilitation of sewer networks, and water distribution networks, respectively. Face-to-face interviews of the experts were used as the principal knowledge elicitation method. Video-and audio-tape recorders were used to acquire knowledge and subsequently transcribe and analyze the interviews. Prototyping and paper-modelling techniques proved useful in the knowledge acquisition for the expansion and refinement of the implemented systems. The Quantity and Quality Expert System (Q2X) was used to carry out an initial feasibility study for a water utility responsible for supplying quality water to a large town with a time-varying demand profile. The Q2X system comprised six knowledge-bases: monitor quality, reservoir operations, feed-source use, network management, stored water quality management, and financial management. The simulation and modeling programs required for a full-fledged Q2X include: programs to model algal growth, network analysis programs, nitrate transformation programs, optimization programs for efficiently managing pump schedules and costs, and hydraulic performance analysis programs to manage head losses and secondary filter management. The Algae Prediction Expert System (APRES) was developed to demonstrate how expert systems methods and techniques could help to solve algae management problems in reservoirs. WATER QUALITY INDEX FOR USE IN THE OPERATIONAL MANAGEMENT OF RIVER WATER QUALITY IN EUROPE.
Middlesex Polytechnic, Enfield (England).
M. A. House.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 159-168.

Descriptors: *Europe, *Pollution index, *Regulations, *Water pollution control, *Water quality, *Water quality management, Biochemical oxygen demand, Monitoring, Nitrates, Public health, Rivers, Toxicity, Water quality standards.

The adoption of a water quality indexing system for the operational management of river water quality provides more detailed information than that of a classification system. The theoretical basis underlying the development of a series of four independent water quality indices involves incorporation of legal water quality standards and criteria and the inclusion of the information on potential water use and toxic determinands directly within their structural format. The General Water Quality Index (WQI) was developed for application within the routine water quality monitoring programs of the United Kingdom water industry. It has a scale of 10-100 and relates changes in water quality to its suitability for use in a range of possible water uses. The Potable Water Supply Index (PWSI) is based on routinely monitored determinands and reflects changes in water quality in terms of its suitability for use in potable water supply. This is similarly the case for the Potable Sapidity Index (PSI) which is based on less frequently monitored toxic determinands such as heavy metals, pesticides and hydrocarbons. The final index, the Aquatic Toxicity Index (ATI), is also based on toxic determinands and reflects water quality in terms of its ability to support healthy fish and wildlife populations. The continuous scale provided by a water quality index allows changes in river water quality to be highlighted. The sub-division of this scale into four water quality and water use categories contains sufficient flexibility to enable information at both government and public levels. ECOLOGICAL MONITORING: THE NEED FOR A STANDARD.
Wimpol Ltd., Swindon (England).
R. M. Pagett.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 169-176, 1 fig, 14 ref.

Descriptors: *Benthos, *Bioindicators, *Monitoring, *Water quality standards, Ecology, Mussels, Sampling, Toxicity, Water pollution effects, Water quality.

Studies of benthic organisms as indicators of water quality offer benefits over chemical surveys for determining suitability of bathing water according to EC directives. Monitoring of natural sentinels should give some quantifiable measure of the bioavailability of pollutants and provide a time-integrated value for a given contaminant. When using sentinel organisms such as mussels as bioindicators of pollutants the biological variability of size, age, reproductive condition, gender and seasonality should be considered. Programmable, submersible pump systems incorporating exchange and macroreticular resins (artificial sentinels) may also be used for in situ concentration of contaminants. Sub-lethal techniques may offer insights into toxicity effects that are otherwise difficult to measure by direct toxicity to benthos. The handbooks produced by the International Biological Programme and the Estuarine and Brackish Water Sciences Association provide a useful digest of present approaches and methodologies for benthic survey work and for various ancillary measurements. Legislative measures should be taken to establish a directive for benthic studies to develop standards in using benthos for water quality testing. (See also W91-01211) (Geiger-PTT)

DEVELOPING AN ECONOMIC METHODOLOGY FOR LEGAL PROVISIONS REGULATING GROUNDWATER POLLUTION.
Georgia Univ., Athens. Dept. of Agricultural Economics.
T. J. Centner.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 177-186, 1 fig, 21 ref.

Descriptors: *Groundwater pollution, *Liability, *Pesticides, *Water law, *Water pollution control, Compensation, Legal aspects, Legislation, Model studies, Negligence.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Liability for groundwater pesticide contamination from the application of pesticides is the focus of debate in recent environmental legislation. Two critical questions accompany the issue of compensation for pollution damage: who should bear losses and how to apportion the losses. To minimize costs, persons may reduce their polluting activities if such is less costly than expected liability costs. The liability models reveal that placement of costs influences the adoption of precautions which in turn affects the amount of a polluting activity. Notwithstanding the fact that it is difficult to delineate a preferred response for all types of pollution, the model and factors concerning groundwater contamination suggest that improvements in efficiency can be achieved through changes in existing liability legislation. In the absence of unilateral precaution, strict liability rules may not offer a very efficient solution. Rather, a liability rule based on negligence may be preferable with private rights of action. Comparative negligence may minimize evidentiary uncertainty and respond to risk aversion, although this depends on the symmetry of precaution. The cheapest cost avoider may impact what type of negligence solution is superior. Alternative suggested solutions involve modifying liability rules or employing property rules to modify entitlements. Legislation has been introduced to change from a strict liability standard to negligence for pesticide application pursuant to label instructions by agricultural producers. Comparative negligence may provide a preferred solution. The second category of response is to modify existing entitlements through new legislation. Special cases involving undeserving victims, small numbers of victims, high victim protection costs, and asymmetrical transaction costs may justify a property rule that shifts an entitlement to agricultural producers who engage in contamination, with victims protected by a liability rule that would allow them to pay the polluter to reduce pollution. However, given the growing concern about groundwater contamination, unknown risks, and externalities, economic incentives such as tradeable permits or pollution charges should be further considered as a component of legislation to respond to problems of nonpoint agricultural pollution. WATER QUALITY: THE PUBLIC DIMENSION.
Middlesex Polytechnic, London (England). Flood Hazard Research Centre.
C. H. Green, M. A. House, A. Burrows, and S. M. Tunstall.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 187-195, 1 fig, 2 tab, 18 ref.

Descriptors: *Cost-benefit analysis, *Public opinion, *Public policy, *Rivers, *Water law, *Water pollution control, *Water use, Recreation, Water costs, Water quality.

In the simplest terms, investment to improve river water quality is justified if the value the public puts upon these improvements is less than the cost of the improvements. Indirectly, such improvements may benefit the public by, for example, lowering the treatment costs of abstracted water. However, the major direct uses of river corridors by the public are as recreational resources, as amenities and as a 'psychic' resource. The latter value arises out of any desire by the public to preserve landscapes, flora and fauna. To determine the value that the public places on possible water quality improvements, it is necessary to explore the motives which underlie any public preference for clean rivers; and upon what basis the public perceives water quality, how they judge whether or not a river is polluted. At the same time, a river as a recreational and psychic resource cannot be separated from its context: the river corridor. The value of water quality improvement in part depends upon the value of the river corridor. Studies carried out to date indicate that perceived water quality is judged largely by the presence or absence of obvious signs of pollution, and of fish. Both as a recreational and as a psychic resource river corridors are valued as 'natural' resources: mature landscapes with abundant plants, birds and insect populations and an absence of other visitors are what the people desire of river corridors. CLINICAL AND ENVIRONMENTAL EFFECTS OF A MAJOR EMERGENCY INVOLVING PUBLIC WATER SUPPLY.
Robens Inst. of Industrial and Environmental Health and Safety, Guildford (England). Trace Element Lab.
A. Taylor.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 277-282, 2 fig, 6 ref.

Descriptors: *Drinking water, *Emergency planning, *Public health, *Water quality management, *Water treatment, Future planning, Management planning, Networks, Potable water, Water pollution effects, Water supply.

Incidents involving the contamination of drinking water supplies serve to illustrate that arrangements to handle the situation and ensure public health are ineffective or are too limited in scope. Appropriate thought should be given to: (1) dealing with an immediate problem, (2) enlisting the support of those affected, and (3) ensuring that follow-up is properly initiated to benefit all groups involved. Consideration should be given to work before an emergency with prediction of what disasters could take place, how a service would be affected, and the preparation of plans to maintain supplies. Procedures to be adopted in response to an emergency include: the immediate assessments and decisions that need to be made, the announcements and communications with the public, the collection and distribution of information, an assessment of areas of ignorance, and the collection of specimens, measurements, and contact with other interested organizations and institutions. A task force core group composed of water industry representatives, microbiologists, toxicologists, and secretariats should be assembled to meet with advisors and plan a course of action to prevent water pollution incidents and to solve pollution problems in an organized manner should an emergency arise. Descriptors: *Bacteriophage, *Bioindicators, *Enteroviruses, *Pollutant identification, *Water quality standards, *Water treatment, Chlorination, Coliforms, Disinfection, Ultraviolet radiation, Wastewater treatment.

Waterborne transmission of viruses is now an established fact, and particularly relevant for several viruses causing gastro-enteritis and infectious hepatitis. Water treatment processes must therefore be designed for adequate virus removal. Direct enumeration of relevant viruses is hampered by technical problems, and reliance is based primarily on culturable enteric viruses which can only be assayed in specialized laboratories and in small series. Bacteriophages offer prospects as routinely applicable model organisms. F-specific RNA (FRNA) bacteriophages are proposed as model viruses for process control because effluent chlorination has little effect on these organisms. In addition the FRNA-phages f2 and MS2 are at least as resistant to UV-radiation used in wastewater treatment processes as the human enteric viruses and more resistant than E. coli. FRNA-phages are sewage indicators rather than indicators of pollution by human excreta. In sewage-polluted environments, a relatively constant ratio of FRNA-phages to culturable enteric viruses of 1000:1 is found. More insight in the ecology of the FRNA-phages is needed before general water quality standards can be formulated. (See also W91-01211) (Author's abstract)

Descriptors: *Agricultural chemicals, *Crop production, *Fertilizers, *Leaching, *Nitrates, *Nonpoint pollution sources, *Water pollution control, *Water pollution sources, Cereal crops, Cultivation, Manure, Nitrogen, Path of pollutants, Soil contamination, Water quality.

Agricultural land is the major water catchment surface. The intensiveness of the farming practiced influences the nitrate content of both ground and surface water. Recent studies show that the majority of nitrate leached from soil comes not directly from fertilizers but is derived from soil organic matter and the quality of nitrate lost is largely a function of land use. Rotations of crops can be adjusted to give the maximum amount of crop cover. Early sown winter cereals will allow less nitrate loss than spring cereals where the land is likely to be uncropped over the autumn and winter. Crops should be fertilized for a realistic yield so that excess fertilizers are not applied to the soil. Fertilization schedules should be decided upon a field-by-field basis, rather than on a district or whole-farm basis, and the quantity of fertilizer nitrogen should take full account of the quantity of nitrogen available from the soil. A high standard of general crop husbandry should be achieved. Nitrogen fertilizers should not be applied in the autumn

in most situations. Cereal straw should be incorporated wherever possible as the input of carbon helps to mop up nitrates during the critical autumn and winter period. Fertilizers should be applied when the crop is ready to use the nitrogen. Adjusting the timing of cultivations can help to reduce mineralization. Use of ammonium-containing fertilizers combined with a nitrification inhibitor may help to reduce nitrogen release from fertilizers. Problems associated with excessive stocking rates supported by imported feeding stuffs can only be solved by moving manure or by reducing stock rate. There is a need for Pan European research to measure the impact of improved agronomy on the reduction of nitrate losses. (See also W91-01211) (Geiger-PTT)

WATER QUALITY MANAGEMENT IN ISTANBUL: CREATING A CLEANER ENVIRONMENT.
Istanbul Water and Sewerage Administration, Turkey.
A. Damali, H. T. Belek, and D. Orhon.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 505-514, 6 fig, 4 tab, 7 ref.

Descriptors: *Turkey, *Wastewater treatment, Water pollution control, *Water pollution treatment, *Water quality management, *Water treatment, Estuaries, Monitoring, Sewerage, Wastewater disposal, Water distribution, Water supply.

Efforts to cleanup environmental pollution problems in Istanbul, Turkey are outlined. Under the Istanbul Water and Sewerage Administration Act number 2560, the responsibility for pollution control rests with the Istanbul Water and Sewerage Administration. In 1984, this agency undertook the restoration of the Golden Horn estuary which was polluted from untreated discharges of municipal and industrial wastewater. Together with massive relocation of industries and the environmental rearrangement of the shorelines, a new plan was put into action to collect all wastewater generated in this area away from the Golden Horn and channel them to wastewater treatment plants. In stage 2 of the wastewater management plan, two major biological treatment works and outfalls were designed at Kucukcekmece and Tuzla. To reduce industrial discharges, pretreatment conditions were specified in relation to the characteristics of each wastewater collection zone and set limits were imposed on wastewater discharges. To balance water sapply with water demand, elaborate schemes involving a number of dams and pipelines under the Bosphorus interconnecting the Asian and the European sides of the city were implemented to provide water for a population of nearly 7 million. In 1987, a Regional Supervisory and Data Acquisition system was planned to monitor and control all the water transmission and distribution facilities within the Greater Istanbul Area. Measures were taken to prohibit all industrial activity with polluting potential in the protection areas defined around surface water resources. (See also W91-01211) (Geiger-PTT)

ADSORPTION OF ODOR SUBSTANCES FROM WATER BODIES TO THE ATMOSPHERE.
Fukuoka Prefecture Environmental Science Inst., Chikushino (Japan).
T. Tsuji, T. Nakano, and T. Okuno.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2019-2021, August 1990. 2 fig, 3 tab, 7 ref.

Descriptors: *Desorption, *Odor control, *Pollution identification, *Wastewater treatment, Air pollution, Ammonia, Dimethyl sulfide, Hydrogen sulfide, Japan, Methylmercaptan, Regulations, Trimethylamine, Water treatment.

The Control of Offensive Odor Law of Japan was established in 1971. Five odor substances were stipulated in the Law. The regulatory standards for odor substances consist of the following three items: (1) Regulation applied at the boundary line of the sites; (2) Regulation at the gas emission facilities; and (3) Regulation for the wastewater. The regulation standards for odor substances on the boundary line were decided according to the odor intensity of 2.5 and 3.5 of a five step scale. A method was developed for the evaluation of odor pollution caused by wastewater. Two standard analytical procedures were applied to the determination of odor substances in water: head space analysis and the purge-trap method. Henry's constants for five odor substances (hydrogen sulfide, methylmercaptan, dimethyl sulfide, ammonia and trimethylamine) were measured at several conditions of pH and equilibrium temperature, and were used for the estimation of odor emissions from wastewater. The concentration of odor substances that include partial dissociated compounds in water can be measured by head space analysis or the purge trap method. Concentrations above the effluent are related to the flux of odor substances from the water phase. (Lantz-PTT)

ACID RAIN AND PHOTOCHEMICAL OXIDANTS CONTROL POLICIES IN THE EUROPEAN COMMUNITY: A DECISION ANALYSIS FRAMEWORK.
Environmental Resources Ltd., London (England).
S. Bell, K. Raymond, S. Watson, and P. Wenman.
Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2253-2262, August 1990. 3 fig, 4 tab, 1 ref.

Descriptors: *Acid rain, *Decision making, *Environmental protection, *Europe, *Public policy, Air pollution, Cost-benefit analysis, Lakes, Model studies, Ozone, Urban areas.

The methodology and key findings are presented of a study to evaluate costs and benefits of alternative acid rain control strategies to be implemented at a European Community level between 1980 and 2000. The methodology adopted was decision analysis, whose key advantage is an explicit consideration of uncertainty. Benefits predicted under some of the control strategies were found to be significantly greater than those predicted for the 'no control' case, particularly for lakes. Urban environmental quality was only expected to improve greatly under the strategy that specifically targeted urban emissions. Predictions for crops and forests were relatively uncertain due to inadequacies in the measurement and modeling of ozone. (Author's abstract)

FIELD EVALUATION OF IN-SITU BIODEGRADATION OF CHLORINATED ETHENES: PART 2, RESULTS OF BIOSTIMULATION AND BIOTRANSFORMATION EXPERIMENTS.
Stanford Univ., CA. Dept. of Civil Engineering.
L. Semprini, P. V. Roberts, G. D. Hopkins, and P. L. McCarty.
Ground Water GRWAAP, Vol. 28, No. 5, p 715-727, September/October 1990. 10 fig, 5 tab, 40 ref. EPA Contract CR-812220.

Descriptors: *Biodegradation, *Biological treatment, *Chlorinated hydrocarbons, *Cleanup, *Fate of pollutants, *Methane bacteria, *Site remediation, *Water pollution treatment, Dichloroethylene, Land disposal, Methane, Oxygen, Trichloroethylene, Vinyl chloride.

Results are presented from a field study that document the in-situ biotransformation of trichlorethylene (TCE), cis-dichlorethylene (cis-DCE), trans-dichloroethylene (trans-DCE), and vinyl chloride (VC) in a saturated, semiconfined aquifer. The enhanced biotransformation was accomplished by stimulating the growth of indigenous methane-oxidizing bacteria (methanotrophs) which transform chlorinated aliphatic compounds by a cometabolic process to stable, nontoxic end products. Experiments were performed in the presence and absence of biostimulation by means of controlled chemical addition, frequent sampling, and quantitative analysis. Biostimulation and biodegradation experiments conducted demonstrated that: (1) A specific class of microorganisms, the methanotrophs which are indigenous to the subsurface environment, can be successfully biostimulated to promote the degradation of certain chlorinated aliphatic compounds; (2) Partial transformation of VC, 90 to 95%; trans DCE, 80 to 90%; cis-DCE, 45 to 55%; and TCE, 20 to 30%, occurred over a relatively short flow path of one to two meters in a field test with fluid residence times of one to two days; (3) The rate of biotransformation was dependent on the structure of the chlorinated organic compounds, with less chlorinated compounds more rapidly transformed; (4) An intermediate transformation product, trans-DCE oxide, was produced and resulted from trans-DCE oxidation, which is consistent with the proposed transformation pathway; and (5) Active utilization of methane in the test zone was required for chlorinated aliphatic biotransformation to occur. Field experiments confirmed the existence of a natural population of methane oxidizers that could be stimulated by introducing methane and oxygen. (Lantz-PTT)

SHORT TERM BIOTIC RESPONSE BEFORE AND DURING THE TREATMENT OF AN ACID MINE DRAINAGE WITH SODIUM CARBONATE.
Q.C. Services, Teton, ID.
W. D. Skinner, and D. E. Arnold.
Hydrobiologia HYDRB8, Vol. 199, No. 3, p 229-235, July 31, 1990. 2 fig, 5 tab, 7 ref.

Descriptors: *Acid mine drainage, *Acid streams, *Pennsylvania, *Sodium carbonate, *Water pollution effects, *Water pollution treatment, Aquatic insects, Colonization, Hydrogen ion concentration, Mayflies, Species distribution, Species diversity, Trout.

The lower portion of Upper Three Runs, a woodland stream in central Pennsylvania, receives acid drainage from a strip mine. In 1974, the effect of this input on pH and benthic invertebrates was studied. The same stations were again sampled in 1986 and the mine drainage was then treated with sodium carbonate for seven days in an effort to evaluate the short term colonization response of brook trout (Salvelinus fontinalis) and invertebrates. No differences in the pattern of pH and invertebrate distribution was found between the 1974 and 1986 results, although pH values and invertebrate densities were higher in 1986. Total number of invertebrates and number of taxa colonizing bricks during three pre-treatment time periods (8, 10, 18 days) did not differ from the single treatment period (7 days). However, two species of Baetis (Ephemeroptera: Baetidae) did increase in the treatment section during sodium carbonate application. The number of brook trout also increased in the treatment section, as compared to one pre-treatment estimate. These results indicate that motile species are able to respond within seven days, whereas, longer treatment may be required to produce community wide responses. (Author's abstract)

LIBRARY U. OF I. URBANA-CHAMPAIGN

Groundwater contamination is a serious problem that is growing in the US, but its true extent is not known and it is difficult to determine because of the complexities of contaminants, their transformation, and fate in groundwater systems. It is also difficult to predict their movement in groundwater. Since it is known that the problem is serious and that the need for groundwater will grow, the mitigation of groundwater contamination, despite its high cost, is necessary. Furthermore, it is difficult to predict effects on human health because they have not been defined for many of the chemicals. Antagonism and synergistic effects of interacting chemicals have not been determined because they are complicated by many factors, such as volatile compounds. The effects of leachates in groundwaters entering streams on the riverine environment and aquatic life have not been determined. Successful mitigation requires: (1) determining which microbial and chemical contaminants are the most serious threat to human health; (2) developing the technology to biologically, chemically and physically transform hazardous waste into nonhazardous materials; (3) developing the technology to properly contain hazardous materials; and (4) developing the technology to remediate contamination and determine the effects of those hazardous materials on soils and water microorganisms and macroorganisms. The challenge is how to immobilize or destroy groundwater contaminants so that they will not enter groundwater, or if they enter groundwater, are confined and destroyed. (Author's abstract)

BUFFERING CAPACITY OF COAL MINE SPOILS AND FLY ASH AS A FACTOR IN THE PROTECTION OF THE AQUATIC ENVIRONMENT.
Polish Academy of Sciences, Zabrze. Inst. of Environmental Engineering.
I. Twardowska.
Science of the Total Environment STENDL, Vol. 91, p 177-189, February 1990. 4 fig, 2 tab, 14 ref.

Descriptors: *Acid mine drainage, *Aquatic environment, *Buffering, *Coal mining effects, *Fly ash, *Mine wastes, *Water pollution control, Alkalinity, Buffer capacity, Calcium carbonate, Chemical analysis, Electric powerplants, Hydrogen ion concentration, Industrial wastes, Leachates, Magnesium carbonate, Path of pollutants, Poland, Thermal powerplants, Waste treatment, Water pollution sources.

Carboniferous rocks and colliery spoil samples representing all the stratigraphic series of the coal-bearing formation of the Upper Silesian coal basin (USCB) in Poland, as well as the drainage from the spoil tips were examined with respect to the contamination potential of colliery spoils as a function of the balance between the buffering and acid generation capacities. The susceptibility of spoils and leachates to acidification was estimated experimentally. Coal mine spoils show different buffering rates and compositions of buffering constituents. In general, for the spoils of the USCB, magnesium carbonate concentrations exceed calcium carbonate content in terms of equivalent units. The system is low-buffered and may produce strongly acidic, high sulfate, total dissolved solids and heavy metal drainage if its buffering rate is < 1.5. The buffering rate of freshly-produced spoils is > 2.4 and guarantees the permanent alkaline or neutral reaction of spoils and leachates. Fly ash from coal-fired thermal power stations contains considerable amounts of buffering calcium constituents, which minimize the solubility of neutralization products. Data obtained for representative samples of such fly ash indicate that an effective increase of buffering capacity of low-buffered colliery spoil, and hence a significant abatement of water contamination, could be achieved by means of controlled placing of fly ash layers in the colliery tip during its construction. This has been confirmed by a successful joint deposition of colliery spoil and fly ash over a 16-year period at Przezchlebie in the USCB. (Hoskin-PTT)

WILLINGNESS TO PAY FOR GROUNDWATER PROTECTION.
New Hampshire Univ., Durham. Dept. of Resource Economics and Community Development.
S. D. Shultz, and B. E. Lindsay.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1869-1875, September 1990. 3 tab, 34 ref. New Hampshire Agricultural Experiment Station Project H-337, Scientific 1643.

Descriptors: *Benefits, *Groundwater quality, *Public opinion, *Water pollution prevention, *Water quality control, Cost allocation, Economic aspects, New Hampshire, Payment, Public policy, Water policy, Water resources management.

To determine the willingness to pay (WTP) for a hypothetical groundwater protection plan in Dover, New Hampshire, a mail contingent valuation survey was conducted. The median WTP value among Dover residents was estimated to be $40 per household, and the community WTP value was estimated to be at least $100,000 annually for a groundwater protection plan. The assessed land values of respondents as well as their incomes were shown to positively influence their WTP values, while their ages had a negative influence on WTP. A variety of other socioeconomic variables, such as respondents assessed house values, the number of years they lived in the community, their knowledge of past groundwater problems and causes, their education, sex, and whether they had children living at home, were shown to have no influence on individuals WTP for groundwater protection. This research illustrates a methodology that other researchers, and water resource managers can use to estimate the value which people place on various water resources and can help to predict whether water policies and projects will be accepted by the public. POISON RUNOFF: NEW ANSWERS TO A PERVASIVE PROBLEM.
Natural Resources Defense Council, Inc., Washington, DC.
P. Thompson.
Environmental Forum ENVFEN, Vol. 6, No. 4, p 5-11, July/August 1989. 3 fig.

Descriptors: *Nonpoint pollution sources, *Path of pollutants, *Pollution load, *Runoff, *Waste load allocation, *Water pollution control, *Water quality management, Administrative regulations, Agricultural runoff, Environmental protection, Management planning, Regulatory agencies, Sediments, United States, Urban runoff, Water quality, Watershed management.

Known for years by the 1972 Clean Water Act title 'nonpoint source pollution', contaminated runoff from farms and urban areas is a dominant source of water pollution. Studies have shown that 65% of river water impairment and 75% of lake water impairment is caused by poisoned runoff form a variety of sources. Sediment is the single largest type of nonpoint source pollution. The barriers to controlling poison runoff include insufficient technical capabilities, the public's failure to perceive the problem, and lack of political resolve to pursue the problem. Recommendations for solving the poison runoff problem require improvement of technical knowledge, increasing public awareness, and implementation of a water quality based approach at the state level. Establishment of total maximum daily load standards for key pollutants provides a goal-oriented framework for implementing best management practices. Model land use and watershed management programs have been initiated by some state and local governments, including 'Load Allocations' for polluted rivers and waterbodies developed by Oregon. It is suggested that the role of the EPA be expanded beyond its present one of technical assistance to enforce a set of minimum criteria by which to judge the adequacy of state programs. FEDERAL AND STATE ROLES IN ENVIRONMENTAL ENFORCEMENT: A PROPOSAL FOR A MORE EFFECTIVE AND MORE EFFICIENT RELATIONSHIP.
Minnesota State Government, St. Paul.
H. H. Humphrey, and L. C. Paddock.
Harvard Environmental Law Review HELRDC, Vol. 14, No. 1, p 7-45, 1990. 186 ref.

Descriptors: *Environmental protection, *Federal jurisdiction, *Legal aspects, *State jurisdiction, *Water pollution control, *Water quality management, Administrative agencies, Enforcement, Institutions, United States.

The allocation of environmental enforcement responsibility between the state and federal government has varied dramatically in different statutory programs enacted over the past twenty years. A significant expansion of the federal role in water pollution control occurred with the passage of the Clean Water Act in 1972. The Safe Drinking Water Act (1982), which regulates the quality of public drinking water systems and the underground injection of contaminants, further expanded federal enforcement authority. Beginning in the mid-1980s, the trend toward federalizing environmental enforcement began to change. The three newest federal environmental programs, the Hazardous and Solid Waste Amendments of 1984 to the Solid Waste Disposal Act, the Emergency Planning and Community Right-to-Know Act of 1986, and the Medical Waste Tracking Act of 1988, all provide for a much stronger state enforcement role. It was recommended that a set of principles for allocating enforcement responsibilities to states and the federal government include the following: (1) States should adopt their own regulatory and enforcement authority to support federal regulatory programs that a state chooses to manage; (2) EPA should ensure a state has developed and has authority to implement a reasonable enforcement strategy before authorizing a state to enforce a federal program; (3) Once a state has been authorized to carry out a federal program, most cases should be handled without EPA inter-

vention; (4) EPA should retain authority to bring enforcement actions in cases involving significant interstate pollution; (5) States should be able to refer certain enforcement cases to EPA; (6) Systems used to account for progress in enforcement should be based on state strategies and designed to encourage innovation by states; and (7) EPA should maintain a credible threat to withdraw authority from states whose implementation of federal programs is consistently inadequate. LIABILITY FOR DAMAGES ARISING FROM AN OIL SPILL.
Exxon Co. USA, Houston, TX.
L. D. Schenke.
Natural Resources & Environment NRENEL, Vol. 4, No. 4, p 14-16/52-54, Spring 1990.

Descriptors: *Judicial decisions, *Legal aspects, *Liability, *Oil pollution, *Oil spills, Administrative agencies, Clean Water Act, Damage, Federal jurisdiction, Legislation, Natural resources, United States.

The Federal Water Pollution Control Act, also known as the Clean Water Act (CWA), provides for the recovery of damages to natural resources in behalf of the public arising from the release of oil. CWA creates liability for certain costs resulting from an oil spill, including damages to natural resources. The natural resource damage provisions of CWA lay dormant until the passage of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), commonly known as superfund. The recent appellate court decision in Ohio v. Department of Interior (DOI) further complicates a clear definition of liability, but brings the focus back to the statutory language of CWA. Several principles are apparent from that decision itself and earlier cases: restoration must take into account the elements of natural recovery and the restoration must be technically feasible and cost-effective. The government is limited in its recovery to resources that are owned by the public at large, and by the long-standing common law prohibiting double counting. Moreover, the statutory goal is of a compensatory rather than a punitive nature. These are the guidelines, together with the holdings in Ohio v. DOI, that will shape future considerations of this issue by DOI and the courts. (MacKeen-PTT)

EFFECT OF ENVIRONMENTAL STORAGE CONDITIONS ON THE ORGANIC CONTENT OF SIMULATED COAL LEACHATES.
Maryland Univ., Solomons. Chesapeake Biological Lab.
N. J. Fendinger, J. C. Radway, and J. H. Tuttle.
Archives of Environmental Contamination and Toxicology AECTCV, Vol. 19, No. 2, p 249-256, March/April 1990. 3 fig, 4 tab, 16 ref. Maryland Department of Natural Resources Grant P97-84-04.

Descriptors: *Biodegradation, *Coal mines, *Coal storage, *Leachates, *Mine drainage, *Path of pollutants, *Water pollution control, *Water pollution sources, Bacteria, Hydrocarbons, Lime, Organic carbon, Oxygen, Temperature.

Simulated coal leaching experiments were conducted at 25 C and 7 C, after lime treatment, and under reduced oxygen tension. Leachate from coal stored at lower temperatures, reduced oxygen, and higher pH values with lime, had lower conductivities, and lower concentrations of dissolved organic carbon (DOC) and total organic carbon (TOC) than leachates from coal stored at higher temperatures and/or oxygen rich conditions. The leaching of DOC was found to be related to acid production by chemoautotrophic bacteria. Lower concentrations of DOC in leachates from coal treated with lime can be attributed to neutralization, subsequent decreased production of acidity by autotrophic bacteria, and the utilization of DOC by heterotrophic bacteria. Concentrations of aliphatic and aromatic hydrocarbons associated with the liquid fraction of leachates were not influenced by temperature or reduced oxygen concentration. Changes in the aliphatic hydrocarbon content of the coal leachates are related to metabolism by heterotrophic bacteria and/or to decreased acidity. (Author's abstract)

GEOTEXTILES AS SEALING LINERS FOR EARTHEN MANURE RESERVOIRS: PART 1, GEOTEXTILE POROSITY.
Macdonald Coll., Ste. Anne de Bellevue (Quebec). Dept. of Agricultural Engineering.
S. F. Barrington, S. O. Prasher, and R. J. Raimondo.
Journal of Agricultural Engineering Research JAERA2, Vol. 46, No. 2, p 93-103, June 1990. 5 fig, 8 tab, 9 ref.

Descriptors: *Geotextiles, *Liners, *Manure, *Materials testing, *Porosity, *Waste storage, *Water pollution control, Infiltration, Performance evaluation, Permeability, Pressure head.

The development of an inexpensive but durable sealing liner is required for earthen manure storage facilities built of coarse sand or gravel. Fine porosity geotextiles can be used for this purpose, because manures seal media of small pore size. Non-woven geotextiles of 20, 30 and 40 micrometers in equivalent porosity were subjected to pressure heads of 0.9, 1.8, and 2.7 m of swine slurry for 1800 h. Infiltration rates decreased from 0.05 mm/sec to <0.1 and 0.02 microm/s within 150 and 1000 h, respectively. Although some of the experimental combinations gave significantly higher infiltration rates, all geotextiles demonstrated minimum seepage rates ranging from 1.3 m/s to 1.8 Nm/s after 100 to 1400 h. In all cases, seepages were highly contaminated. Highest chemical oxygen demand levels were observed for the 2.7 m heads as well as the 20 micrometer fabric. This 20 micrometer fabric produced significantly higher infiltration rates, probably because of its lower permeability which encourages a less compact manure seal at its surface. GEOTEXTILES AS SEALING LINERS FOR EARTHEN MANURE RESERVOIRS: PART 2, SEALING MECHANISMS.
Macdonald Coll., Ste. Anne de Bellevue (Quebec). Dept. of Agricultural Engineering.
S. F. Barrington, S. O. Prasher, and R. J. Raimondo.
Journal of Agricultural Engineering Research JAERA2, Vol. 46, No. 2, p 105-112, June 1990. 2 fig, 6 tab, 13 ref.

Descriptors: *Geotextiles, *Liners, *Manure, *Materials testing, *Waste storage, *Water pollution control, Canada, Infiltration, Permeability, Porosity, Solids, Temperature.

Field sealing of geotextile liners for earthen manure reservoirs was verified in the laboratory. A fabric of 20 micrometers in equivalent porosity was subjected to swine slurries of various total solid (TS) levels as well as sterilized and natural 5% TS swine slurries. The infiltration tests indicated that satisfactory clogging of the fine porosity geotextile requires swine slurries of minimum TS content of 4%. Furthermore, higher TS levels guarantee a longer lasting manure seal at the fabric surface. Sterilized manure was used to produce the cool field conditions found in Canada, where manure remains at temperatures of 5-10 C throughout most of the year. Under such conditions biological sealing mechanisms are almost nonexistent. The manure mat retained its impermeability under conditions of sterilization while the natural manure mat demonstrated an increase in infiltration after 1000 h. This gain in manure mat permeability can be attributed to the microbial degradation of manure solids. (See also W91-01700) (Author's abstract)

RESPONSES OF PLANKTON AND NUTRIENTS TO METHYLENE BLUE-PHOTOSENSITIZED LAKE RESTORATION.
Nevada Univ., Reno. Dept. of Civil Engineering.
R. J. Watts, and R. H. French.
Chemosphere CMSHAF, Vol. 20, No. 6, p 663-671, 1990. 9 fig, 13 ref. U.S. EPA Assistance Agreement R811124-01.

Descriptors: *Lake restoration, *Methylene blue, *Nutrients, *Photolysis, *Plankton, *Water pollution treatment, Algae, Algal blooms, Bacteria, Chlorophyta, Cyanophyta, Diatoms, Eutrophic lakes, Lakes, Nitrogen, Phosphorus, Trophic level, Viruses.

The use of sensitized photolysis has been proposed as an improved lake restoration method. Methylene blue is a sensitizer; in the presence of 500 to 700 nm light it is excited to a triplet state. A primary target of the triplet energy is molecular oxygen, which is excited to singlet oxygen. Singlet oxygen is toxic to bacteria, viruses, and algae, and serves as the basis for treating algal blooms. Sections of eutrophic Lahontan Reservoir, Nevada were isolated using in situ microcosms and treated with 1.0 mg/L methylene blue to assess its effectiveness for lake restoration. Green algae (Chlorophyta) and diatom (Bacillariophyceae) levels decreased significantly with one day of treatment; however, blue-green algae (Cyanophyta) levels did not decline. Nitrogen and phosphorus concentrations did not increase after photochemical treatment over the 10-day study period. It is concluded that the use of methylene blue for lake restoration may therefore be ineffective in treating blue-green algae, the group which often causes the most problems in eutrophic systems. (Agostine-PTT)

SOIL CLEAN UP BY IN-SITU AERATION: V. VAPOR STRIPPING FROM FRACTURED BEDROCK.
Vanderbilt Univ., Nashville, TN. Dept. of Chemistry.
D. J. Wilson.
Separation Science and Technology SSTEDS, Vol. 25, No. 3, p 243-262, 1990. 11 fig, 4 tab, 23 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Aeration, *Bedrock, *Cleanup operations, *Mathematical models, *Soil contamination, *Vapor stripping, *Water pollution treatment, Diffusion, Model studies, Transport, Ventilation.

A mathematical model for soil vapor stripping is presented which permits one to model vapor stripping from porous fractured bedrock, where one cannot make the assumption of local equilibrium between the stationary condensed phase and the moving vapor phase with respect to contaminant transport. Models for lab column operation and field operation of a vapor stripping well are presented. A lumped parameter approach is used to handle the kinetics of diffusion of the volatile contaminant from the interiors of the bedrock out to the moving soil gas. A method for estimating the time constant for this diffusion transport is presented and the effects of the time constant on the performance of vapor stripping operations are assessed. Increasing the diffusion time constant results in reduced removal rates. The effects of impermeable circular caps on vapor stripping wells with and without passive vent wells are examined. A moderate improvement in contaminant removal rate with increasing cap radius is seen in systems without passive vent wells. In the absence of a cap the presence of passive wells decreases the contaminant removal rate. In the presence of a cap the presence of passive wells increases the removal rate by 20%. These results suggest that the use of passive wells when one is vapor stripping underneath impermeable surfaces may be moderately advantageous. (See also W90-11832) (Agostine-PTT)

WELL LOCATION IN CAPTURE ZONE DESIGN USING SIMULATION AND OPTIMIZATION TECHNIQUES.
Connecticut Univ., Storrs. Environmental Research Inst.
D. P. Ahlfeld, and C. S. Sawyer.
Ground Water GRWAAP, Vol. 28, No. 4, p 507-512, July/August 1990. 6 fig, 1 tab, 12 ref.

Descriptors: *Flow models, *Groundwater pollution, *Model studies, *Site remediation, *Water pollution treatment, Aquifers, Cleanup, Costs, Economic aspects, Linear programming, Pump wells.

The utility of a groundwater simulation model in combination with numerical optimization to provide guidance for proper siting of extraction wells for aquifer remediation was examined. By mathematically defining design criteria, the analyst can directly determine the pump locations and pumping rates which minimize the operational cost of the remediation system. By varying the parameters of the optimization model and comparing the resulting solutions, inferences can be drawn about aspects of remediation. For an example problem, providing greater choice of the location of the wells produced a 37% reduction in pumping cost. Careful selection of well position in an aquifer cleanup can make a major difference in the total pumping cost when considering containment of the contaminant and subsequent cleanup. GROUND-SURFACE DELINEATION OF FRACTURES OVER MINED-OUT OPENINGS USING CARBON DIOXIDE EMISSIONS.
Idaho Univ., Moscow. Coll. of Mines and Earth Resources.
F. E. Kirschner, R. E. Williams, and D. R. Ralston.
Ground Water GRWAAP, Vol. 28, No. 4, p 576-583, July/August 1990. 7 fig, 1 tab, 35 ref. Bureau of Mines Cooperative Agreement No. CO278001.

Descriptors: *Acid mine drainage, *Carbon dioxide, *Geologic fractures, *Groundwater flow, *Groundwater recharge, *Grouting, *Water pollution control, *Water pollution sources, Path of pollutants, Soil gases.

Subsurface conduits or zones of hydrogeologic discontinuities that connect mined-out areas in the subsurface through the unsaturated zone to the ground surface of the study area of the Bunker Hill Mine located in Kellogg, Idaho, are amenable to detection by the probe extracted static grab sample/onsite analysis method when the appropriate conditions exist. The method is: cost effective; time-efficient; noninvasive; relatively precise; and relatively easy to use. Four discrete CO(2) anomalies are interpreted to identify four structurally created pathways for groundwater recharge. The high CO(2) concentration zone that is associated with the mappable fault appears to be discrete even though the hanging wall of this fault is a fracture zone, not an absolute plane. The area must be capped or otherwise treated and selective grouting is not justifiable for infiltration control. (Miller-PTT)

FIELD EVALUATION OF IN-SITU BIODEGRADATION OF CHLORINATED ETHENES: PART I, METHODOLOGY AND FIELD SITE CHARACTERIZATION.
Stanford Univ., CA. Dept. of Civil Engineering.
P. V. Roberts, G. D. Hopkins, D. M. Mackay, and L. Semprini.
Ground Water GRWAAP, Vol. 28, No. 4, p 591-604, July/August 1990. 12 fig, 6 tab, 29 ref. EPA Cooperative Agreement No. CR-812220.

Descriptors: *Biodegradation, *Chlorinated hydrocarbons, *Field tests, *Groundwater pollution, *In situ treatment, *Site remediation, *Tracers, *Water pollution treatment, Aquifers, Automation, California, Chlorinated ethenes, Data acquisition, Military reservations, Mountainview, On-site data collections, Organic solvents, Water pollution abatement.

The conditions at the Moffet Naval Air Station, Mountainview, California site proved to be favorable for a quantitative evaluation of in-situ aquifer restoration by enhanced biodegration. Bromide tracer tests revealed travel times of 8 to 27 hours from the injection well to the various monitoring wells and 20 to 42 hours from the injection well to the extraction well. Complete breakthrough of the tracer at the monitoring wells was facilitated by choosing a line of wells aligned with the regional flow and selecting injection and extraction flow rates of approximately 1.5 and 10 liters/min. Transport studies were conducted with selected halogenated organic compounds. The retardation factors ranged from 2 to 12. The breakthrough responses for the more strongly absorbing compounds, e.g. trichloroethylene, exhibited pronounced tailing, such that a minimum period of several weeks was required to achieve complete saturation of the aquifer. The microcomputer-driven sampling, analysis and data management system provided automated data acquisition at sample intervals of 40 minutes with coefficients of variation smaller than 20% and allowed for real-time surveillance of the dynamic responses. (Author's abstract)

DECREASING CHLORIDE TRENDS OBSERVED AT LAKE ERIE MUNICIPAL WATER INTAKES.
Lake County Dept. of Health, Waukegan, IL.
R. S. Whyte, J. H. Hartig, and G. J. Hopkins.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 233-240, 1990. 2 fig, 3 tab, 22 ref.

Descriptors: *Chlorides, *Lake Erie, *Pollution load, *Statistical analysis, *Water pollution control, Time series analysis.

Using available chloride data collected from seven municipal intakes drawing water from Lake Erie, linear trend analyses were performed to elucidate trends between the late 1960's and the early 1980's. Both seasonality and autocorrelation of the data were considered. Seasonality did not appear to significantly affect the trend. By removing the effects of autocorrelation more efficient estimates of the regression parameters were obtained and the achieved level of significance was considered valid. A decreasing chloride trend was found for all municipal intakes examined in the study. The rate of chloride decrease ranged from 0.47 to 0.88 mg/L/yr (mean:0.7 mg/L/yr). This decreasing chloride trend in Lake Erie is believed to be the result of reduced loadings resulting from point source controls and the cessation of certain industrial operations which historically discharged high chloride loadings. VOLATILIZATION OF SELENIUM FROM AGRICULTURAL EVAPORATION POND SEDIMENTS.
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
U. Karlson, and W. T. Frankenberger.
Science of the Total Environment STENDL, Vol. 92, p 41-54, March 1990. 3 fig, 4 tab, 27 ref.

Descriptors: *Biodegradation, *Decontamination, *Farm wastes, *Fate of pollutants, *Microbial degradation, *Sediment contamination, *Selenium, *Volatility, Agricultural chemicals, Agricultural runoff, Agricultural watersheds, Chitin, Evaporation ponds, Farm ponds, Manure, Microorganisms, Organic carbon, Organic nitrogen, Sediment analysis.

Microbial volatilization of Se was evaluated as a means of detoxifying Se-contaminated sediments. Sediment samples containing 60.7 mg Se/kg (Kesterson Reservoir) and 9.0 mg Se/kg (Peck ponds) were incubated for 273 days in closed systems located in the greenhouse. Various organic and inorganic amendments were tested for their capacity to enhance the microbial process, including Citrus (orange) peel, Vitis (grape) pomace, feedlot manure, barley straw, chitin, pectin, ZnSO4, (NH4)2SO4, and an inoculum of Acremonium falciforme (an active Se methylating fungus). With the Kesterson sediment, the highest Se removal resulted from the combined application of citrus peel and ZnSO4, followed by the citrus peel alone, and citrus peel combined with ZnSO4, (NH4)2SO4 and A. falciforme. Manure, pectin, chitin, and straw plus N had less pronounced effects. Without the amendments, cumulative Se volatilization was 6.1% of the initial inventory. Grape pomace inhibited the process. With the Peck sediment, the highest amount of Se removed was observed with chitin, manure, and citrus peel alone. Without amendments, 14% of the native Se was volatilized in 273 days. Pectin, straw plus N, and grape pomace were among the less effective amendments for the Peck sediments. The differences in the effectiveness of each treatment between the two seleniferous soils may be a result of the residual N content of the sediments. With the Kesterson sediment, which was high in organic C and N, added N inhibited volatilization of Se, while with Peck sediments (low in organic C and N), N-rich materials tended to accelerate Se volatilization. Inoculation with A. falciforme did not enhance Se evolution from either sediment, indicating that there was a sufficient population of microflora capable of producing gaseous Se. (Author's abstract)

EVALUATION OF DETENTION BASIN PERFORMANCE IN THE PIEDMONT REGION OF NORTH CAROLINA.
North Carolina Univ. at Charlotte. Dept. of Civil Engineering.
J. S. Wu.
Available from National Technical Information

Service, Springfield, VA 22161 as PB90-186768/AS. Price codes: A04 in paper copy; A01 in microfiche. North Carolina Water Resources Research Institute, Raleigh, Completion Report No. 248, (UNC-WRRI-89-248), July 1989. 45p, 18 fig, 15 tab, 18 ref. State Project 70077.

Descriptors: *Detention ponds, *North Carolina, *Pollutant identification, *Storm water, *Urban runoff, *Water quality control, Ammonia nitrogen, Copper, Iron, Lead, Metals, Phosphorus compounds, Piedmont region, Sampling, Storm runoff, Suspended solids, Zinc.

Results are summarized of a stormwater sampling program conducted on three existing urban wet detention ponds in the Piedmont region of North Carolina in the city of Charlotte. These ponds were not originally designed for water quality control. A total of eleven storm events was monitored. Runoff samples were analyzed for total suspended solids, total and ortho phosphorus, total Kjeldahl and ammonia nitrogen, and metals of iron, zinc, copper, and lead. The removal efficiency of pollutants for each detention pond was computed as the percent difference of the total pollutant mass entering and leaving the detention pond. An U.S.EPA model was employed to derive a relationship for estimating the size of detention ponds to achieve targeted levels of water quality improvement. It is estimated that about 1.0% to 2.0% of watershed area would be needed for siting of wet detention ponds to accomplish a sediment removal efficiency of 70% or better. The quality of storm runoff from the Piedmont North Carolina urban areas was found to be generally better than that reported by the National Urban Runoff Program. The research findings are consistent with the North Carolina State Government guidelines for sizing wet detention ponds for water quality considerations. Results of this study are based on Piedmont watershed characteristics and should not be applied to other regions without consideration of site specific information. (USGS)

Acid precipitation is a major threat to Norwegian ecosystems. Politically and administratively, the issue has been given top priority among environmental issues for nearly 20 years. Hence, fairly large resources are spent on monitoring, research activities, reduction measures and local ameliorating countermeasures. During the seventies, a joint interdisciplinary research and monitoring project was carried out to establish basic knowledge of the cause and effect relationships and extent of problems caused by acid rain. From 1980 onwards the activities were continued within a separate monitoring program which was divided into four major categories: air processes, water, aquatic fauna, and forest and vegetation. The main purpose of the program was to reveal the temporal trends and to assess the geographical distribution of effects. Presently, high priority acid rain projects in Norway include: photo-oxidants and nitrogen compounds, transformation processes and effects, mechanisms for acidification recovery of soils and waters, effects on forest and vegetation, effects of aluminum, and restoration of fish stocks. Norwegian scientists cooperate extensively with groups in other countries and participate in international monitoring networks and research programs. (Author's abstract)

ENVIRONMENTAL TESTING-ISSUES AND DIRECTIONS.
D. Friedman, and J. Poppiti.
Journal of Chromatographic Science JCHSBZ, Vol. 28, No. 9, p 450-452, September 1990. 2 tab.

Descriptors: *Environmental protection, *Monitoring, *Regulations, *Sampling, *Testing procedures, Data acquisition, Data interpretation, Laboratory methods, Standards.

The industry of environmental testing is expanding faster than the revisions to the EPA methods manuals are being developed. Changes are occurring in both directions of the testing itself and in the goals of public policy. Environmental decision making rests on the ability to monitor the environment, establish goals, and monitor for compliance with these goals. Because of the complexity of the analytical problems encountered in the hazardous waste program, it has become apparent to the EPA that the system needs to have greater flexibility. Often the analyst encounters matrix or interference problems when trying to measure an analyte of interest. Analysts need to have the flexibility to select the method that is most appropriate to the sample and problem. The lab also needs the freedom to modify methods when standard protocols do not yield data that meets the Data Quality Objective (DQO). (Lantz-PTT)

UTILIZATION OF HYDROCARBON SUBSTRATES BY HEAVY OIL-DEGRADING BACTERIA ISOLATED FROM THE SEA WATER OF OIL-POLLUTED BISAN SETO.
Shimonoseki Univ. of Fisheries (Japan). Lab. of Microbiology.
B. Kimura, M. Murakami, and H. Fujisawa.
Nippon Suisan Gakkaishi (Bulletin of the Japanese Society of Scientific Fisheries) NSUGAF, Vol. 56, No. 5, p 771-776, May 1990. 3 fig, 5 tab, 15 ref.

Descriptors: *Biodegradation, *Fate of pollutants, *Hydrocarbons, *Marine bacteria, *Oil pollution, *Water pollution treatment, Bisan Seto, Carbon, Japan, Oil spills, Seawater.

Eighty-one strains of oil-degrading bacteria were isolated from the seawater of Bisan Seto, a polluted Japanese coastal area which had been the site of an oil spill. These bacteria were tested for their ability to grow on four major groups of hydrocarbons--normal alkanes, branched alkanes, cycloalkanes and aromatic hydrocarbons--all known to be present in heavy oils. The hydrocarbon substrates tested were n-hexadecane (as a representative normal alkane), pristane (2, 6, 10, 14-tetramethylpentadecane, as a representative branched alkane), cyclododecane (as a representative cycloalkane), and low molecular weight polyaromatic hydrocarbon mixtures (fluorene plus anthracene plus pyrene). All the bacteria were able to utilize n-hexadecane and pristane, but not cyclododecane and the aromatic hydrocarbons, as a sole carbon source for growth. Using two representative strains of the bacteria, further degradation characteristics were also studied on normal alkanes of different chain length, pristane, and the aromatics. Results suggest that the degradation potential of normal alkanes and branched alkanes is quite high in Bisan Seto, and also that cyclo-alkanes and polyaromatic hydrocarbons are much more resistant to microbial attack in this area. GROUNDWATER TREATMENT WITH ZERO AIR EMISSIONS.
Peroxidation Systems, Inc., Gardena, CA.
D. A. Cheuvront, C. L. Giggy, C. G. Loven, and G. H. Swett.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 143-148, August 1990. 3 fig, 13 tab, 11 ref.

Descriptors: *Air pollution, *Cleanup operations, *Groundwater pollution, *Path of pollutants, *Volatile organic compounds, *Water pollution treatment, Activated carbon, Organic pollutants, Ultraviolet radiation.

Air emissions from the treatment of volatile organic compound (VOC)-contaminated groundwater are a growing problem in the United States. When air stripping is used to remove VOCs from contaminated groundwater, contaminants are released into the air causing air pollution problems. Several treatment processes with zero air emissions are available for the decontamination of groundwater. In the liquid phase carbon process, organic contaminated water is percolated through beds of granular activated carbon. The carbon is later regenerated in a fired furnace or is disposed of in a hazardous waste landfill. In air stripping/vapor phase carbon, the organic pollutants are scavenged in the vapor phase usually onto activated carbon which is regenerated either on-site by steam stripping or off-site by furnace. In ultraviolet (UV) chemical oxidation, hydrogen peroxide is used in conjunction with UV light to catalyze the chemical oxidation of organic contaminants in water. This system requires little operator attention and does not produce air emissions. Five case studies relate how the air pollution regulation factors affected the decision for groundwater remediation programs. A southern California aerospace manufacturer chose UV/peroxidation for emissions control in its air stripping operations because of the economic attractiveness of this process and the waiver of permit requirements for UV/peroxidation units. For similar reasons, a northern California fleet refueling facility chose UV peroxidation to cleanup a subsurface spill of leaded gasoline. A northern California industrial facility chose a UV/peroxidation system to handle air stripping discharge from the cleanup of a trichloroethylene plume that was migrating towards a residential area. A New York industry chose UV/peroxidation to help cleanup efforts for a groundwater contaminated with trichloroethylene, vinyl chloride and numerous other industrial solvents. A California industrial facility selected UV peroxidation to comply with regulations to reduce toxicity, mobility and volume of hazardous chemicals at Superfund sites. (Geiger-PTT)

PERFORMANCE OF SELECTED IN SITU SOIL DECONTAMINATION TECHNOLOGIES: AN AIR FORCE PERSPECTIVE.
Air Force Engineering and Services Center, Tyndall AFB, FL.
D. C. Downey, and M. G. Elliott.
Environmental Progress ENVPDI, Vol. 9, No. 3,

LIBRARY U. OF I. URBANA-CHAMPAIGN

p 169-173, August 1990. 19 ref.

Descriptors: *Biodegradation, *Cleanup operations, *Decontamination, *Groundwater pollution, *In situ treatment, *Site remediation, *Soil contamination, Aeration zone, Monitoring wells, Performance evaluation, Radio waves, Vadose zone.

Soil structure, fuel composition, and the depth at which the release of fuels occurs can affect accessibility of treatment chemicals on hydrocarbon contaminants. When hydrocarbons are released in water-saturated or near-saturated conditions, they form large blobs which are trapped in larger pore spaces with little displacement of water from micropores. Fuels released in drier soils above the water table tend to migrate into micropores and form thin films over soil particles. These residuals may have more limited contact with treatment fluids. Enhanced in situ biodegradation attempts to create favorable aerobic conditions in an environment of heterogeneous soils and delicate geochemical balances. Air Force pilot studies using enhanced in situ biodegradation were conducted at jet fuel spill sites at Kelly and Elgin Air Force Bases. A nutrient and hydrogen peroxide delivery system was designed to test the relative effectiveness of three delivery methods in stimulating biodegradation in the vadose zone and in the groundwater. Two shallow injection wells, infiltration galleries, and a spray irrigation system were installed for a side-by-side comparison. After 18 months of peroxide and nutrient additions, aromatic concentrations in groundwater monitoring wells had decreased from 8 ppm to 200 ppb. However, intense sampling of soils above and beneath the water table did not show a significant removal of soil-bound fuel residuals suggesting that enhanced biodegradation cannot be applied at sites with poor permeability. Results of in situ soil venting tests at Hill Air Force Base showed that venting is very effective in removing large amounts of jet fuel from the soil in a relatively short period of time. Laboratory and field tests using radio-frequency (RF) heating of soil contaminated with jet fuel showed high rates of removal of volatile aliphatic and aromatic compounds from the soil. Use of a state-of-the-art RF generator for full-scale applications could reduce the power input to less than 500 kilowatt-hr/cu yard. Two enhancements to the soil venting process that will be tested in the future are the combination of soil venting and RF heating and the optimization of biodegradation of fuels that occurs during the venting process. DESIGN CONSIDERATIONS FOR SOIL CLEANUP BY SOIL VAPOR EXTRACTION.
ENSR, Acton, MA.
R. Ball, and S. Wolf.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 187-189, August 1990. 4 fig, 4 tab, 3 ref.

Descriptors: *Cleanup operations, *Decontamination, *In situ treatment, *Organic pollutants, *Site remediation, *Soil contamination, *Volatile organic compounds, *Water pollution prevention, Aeration zone, Bioremediation, Design criteria, Groundwater pollution, Oil pollution, Oil spills, Volatility.

A state-of-the-art approach for design and implementation of a soil vapor extraction system to remediate soil at a federal site in the Midwest contaminated with tetrachloroethylene is presented. Soil vapor extraction is performed by applying a vacuum to the soils to induce volatilization of soil contaminants. The extracted air is usually treated for volatile organic compounds (VOC) removal prior to discharge to ambient air. Typical data requirements needed for site characterization and soil vapor extraction system design depend on the size and complexity of the contaminated site. The contaminants must have sufficient volatility, and the soil must have sufficient air permeability for soil vapor extraction to be feasible. In a soil containing both volatile and nonvolatile contaminants, if the nonvolatile fraction is biodegradable and the soil has sufficient air permeability, bioremediation of the nonvolatile fraction may be feasible by inducing subsurface air flow with soil vapor extraction and by adding nutrients. An integrated systems approach must be taken to remediate a site with contaminated soil and groundwater. The groundwater table is lowered during groundwater pumping and treatment thereby increasing the depth of the unsaturated zone and improving volatilization and capture efficiency of VOCs by soil vapor extraction. At the Midwest site a conceptual model of the subsurface contamination of the soil by tetrachloroethylene (PCE) was developed to design the air extraction and injection well for vapor extraction. In addition, computer analyses of the subsurface airflow induced by the soil vapor extraction process were performed to select optimal locations for the wells. To estimate the remediation time required to achieve the desired cleanup criteria of 1 ppm in the soil, a laboratory column study was performed. The modeled tetrachloroethylene emission rate curve from the laboratory column study was scaled-up to predict the emission rate for a full scale soil vapor extraction system. Actual PCE concentrations in the six monitoring wells agreed well with predicted PCE concentrations from the laboratory model. (Geiger-PTT)

IN SITU BIODEGRADATION OF TCE CONTAMINATED GROUNDWATER.
ECOVA Corp., Redmond, WA.
M. J. Nelson, J. V. Kinsella, and T. Montoya.
Environmental Progress ENVPDI, Vol. 9, No. 3, p 190-196, August 1990. 9 fig, 1 tab, 5 ref.

Descriptors: *Biodegradation, *Bioremediation, *Chlorinated hydrocarbons, *Groundwater pollution, *In situ treatment, *Organic solvents, *Water pollution treatment, Activated carbon, Air stripping, Aquifers, Biological treatment, Fate of pollutants, Microbial degradation, Pseudomonas, Solvents, Trichloroethylene.

Trichloroethylene (TCE)-contaminated groundwater is presently treated by transferring the solvent either to a solid (carbon adsorption) or to the atmosphere (air stripping). Biological treatment of the contaminated water is an alternative that causes complete destruction of the solvent. When performed within the aquifer it is termed in situ biotreatment. A specific strain of bacteria (G4) has been isolated that degrades TCE enzymatically. The process has been extensively tested in the laboratory and confirmed in a field pilot test. The pilot test involved the injection of a clean, oxygenated water stream directly into the TCE plume. Nutrients and G4 were added to the injection stream and TCE and TCE concentrations were measured up-and downgradient of the injection well. A decline in TCE levels was observed eight hr after injection and continued for the following ten days. TCE concentrations were reduced from a high of 3,000 parts per billion to a mean value of 78 parts per billion during a 20 day period. (Author's abstract)

SIMPLE AND RAPID METHOD FOR SCREENING OF HEAVY OIL-DEGRADING BACTERIA FROM MARINE ENVIRONMENT.
Shimonoseki Univ. of Fisheries (Japan). Lab. of Microbiology.
B. Kimura, M. Murakami, and H. Fujisawa.
Nippon Suisan Gakkaishi (Bulletin of the Japanese Society of Scientific Fisheries) NSUGAF, Vol. 56, No. 6, p 1009, June 1990. 1 tab, 6 ref.

Descriptors: *Aquatic bacteria, *Biodegradation, *Culturing techniques, *Microbial degradation, *Water pollution treatment, Fate of pollutants, Membrane processes, Nutrients, Oil spills, Separation techniques.

A rapid method for screening heavy oil-degrading bacteria involves dipping a nitrocellulose membrane filter in a hexane solution containing 2% (weight/volume) desulfurized fuel, evaporating the hexane, and placing the filter at room temperature on the top of 1/5 ZoBell 2216E agar plate on which bacterial colonies are present. After incubation at 25 C for 2 days, the filter is taken out from the agar plate and washed with hot water. Colonies with the ability of oil-degradation make hydrophilic spots on the filter which can be easily recognized by visual inspection or microscopic observation if needed. Results of a screening trial showed that among 23 bacterial strains which were isolated following a previously described procedure, 7 isolates demonstrated positive results with the present method. When these bacterial strains were tested for oil degradation determined by gravimetric analysis, all of the positive isolates degraded desulfurized fuel oil, whereas none of the negative isolates did. Besides being rapid and simple, the present method allows the isolation of oil-degrading bacteria even in the presence of organic nutrients other than hydrocarbons, such as peptone or yeast extract, which have been previously regarded as undesirable additives for isolation of oil-degrading bacteria. HISTORIC DEVELOPMENT OF THE CONCENTRATE REGULATIONS.
Stone and Webster Engineering Corp., Fort Lauderdale, FL.
W. J. Conlon.
Desalination DSLNAH, Vol. 78, No. 1, p 11-16, July 1990. 1 tab, 4 ref.

Descriptors: *Desalination wastes, *Florida, *Regulations, *Reverse osmosis, *Waste disposal, *Water treatment, Desalination, Environmental protection, Governmental interrelations, History, Injection wells, Land application, Membrane processes, Waste characteristics.

Florida has the highest percentage of membrane process plants in the United States. Membrane processes will play an important role as a treatment technology which will assist the water treatment industry to meet present and future drinking water regulations. Perhaps membrane technology will be the best available technology in terms of the greatest organic and inorganic contaminant removal for the amount of capital invested. However, safe methods of concentrate disposal will be necessary, as well as fair and pragmatic regulations concerning disposal, for the application of membrane processes to continue. Information on the characterization of concentrate discharges and deep well injection economics as they relate to all construction will assist the Florida Department of Environmental Regulation (FDER) in its negotiations with EPA on the creation of a separate class of injection wells solely for process concentrate design. A recent rule change to 17-28, Florida Administrative Code (FAC) allows membrane process plants discharging into Class G-III or Class G-IV groundwater to discharge non-hazardous concentrate through land application to aquifers containing greater than 1500 mg/L total dissolved solids. This demonstrates that regulations can be changed for the better through the cooperation of FDER with consultants, utility owners, and other interested parties. Further cooperation may result in additional rule changes and more uniform interpretation of the existing rules and regulations. (Author's abstract)

CURRENT REGULATORY CONCERNS RELATED TO THE DISPOSAL OF RO CONCENTRATES IN FLORIDA.

Florida State Dept. of Environmental Regulation, Tallahassee.
R. S. Dehan.
Desalination DSLNAH, Vol. 78, No. 1, p 17-26, July 1990. 2 fig, 3 tab.

Descriptors: *Desalination wastes, *Florida, *Regulations, *Reverse osmosis, *Waste disposal, *Water quality standards, *Water treatment, Desalination, Drinking water, Groundwater, Impaired water use, Injection wells, Local governments, Membrane processes.

During adoption of the latest amendments on groundwater regulations affecting reverse osmosis (RO) discharge, the Florida Department of Environment Regulation (FDER) sought to encourage the use of reverse osmosis as a good way of utilizing groundwater of marginal quality. Chapter 387 of the Florida Statutes, which is the State Comprehensive Plan, lists 14 policies, the very first of which is 'to ensure the safety and quality of drinking water supplies and promote the development of reverse osmosis and desalination technologies for developing water supplies. The groundwater regulation codes, which were developed in 1983, classify groundwater into four classes on the basis of water quality as measured by total dissolved solids and geological confinement. These classes are discussed, as well as water quality standards for groundwater and drinking water standards. Last year FDER amended the secondary drinking water standards as they relate to groundwater and exempted existing facilities from compliance with the secondary standards, but they are still applicable to new facilities. Existing sources and new sources of groundwater discharge are dealt with in different ways in the permitting rules. Regulations concerning desalting with discharge of RO concentrates, such as regulations governing deep well injection of concentrates and construction and operation of underground injection wells are outlined. Arguments from FDER are presented for changing current regulations to classify RO concentrate injections wells as municipal rather than industrial, to relieve RO concentrate wells of tubing and packer requirements. S. FEDERAL HIGHWAY ADMINISTRATION'S RECEIVING WATER IMPACT METHODOLOGY.
Woodward-Clyde Consultants, Oakland, CA.
W. Strecker, E. D. Driscoll, P. E. Shelley, D. Gaboury, and J. D. Sartor.
The Science of the Total Environment STENDL, Vol. 93, p 489-498, April 1990. 9 fig, 1 tab, 6 ref.

Descriptors: *Highway effects, *Model studies, Project planning, *Risk assessment, *Storm runoff, Federal jurisdiction, Political aspects, Pollutants, Probabilistic process, Rainfall intensity, Statistical methods, Vollenwieder model, Water pollution, Water quality.

A methodology for assessing the impacts of highway runoff on receiving waters has been developed for Federal Highway Administration (FHWA) for use by state transportation agencies. The methodology is intended to be used as a screening level analysis tool. In cases where there are serious enviornmental risks which cannot be easily mitgated, a more rigorous approach may be necessary. Included in the design procedure is a water impact analysis, which uses the Vollenwieder model. The lake analysis does not currently use a probabilistic approach. The interactive Decision Support program that takes the procedure user through the Federal Highway Administration's highway runoff analysis procedure is described. The procedure requires the input of fixed site data, rainfall and streamflow statistics, highway runoff water quality, and target concentrations. The methodology user is provided guidance in entering required data. Output of the procedure is a run frequency of the exceedances of the target concentration. This methodology is intended for screening level analyses. (Author's abstract)

The Science of the Total Environment STENDL, Vol. 93, p 507-514, April 1990. 4 tab, 10 ref.

Descriptors: *Decontamination, *Detention reservoirs, *Highway effects, *Surface runoff, *Water pollution control, *Water pollution treatment, *Water quality management, Effluents, Heavy metals, Suspended solids, Water pollution, Water quality standards.

In order to investigate the possibilities for removing the pollutants originating from motor vehicle trafic that are present in highway surface runoff, the influents and effluents of three detention basins that differed in design and function were analyzed during the years 1978 to 1981. The specific objective of the investigations was to study the elimination of heavy metals and organic substances from the runoff, in order to determine the dimensioning criteria for the construction of treatment facilities. A further objective was to determine the composition of the sludges accumulating in the basins. The investigation of the basins showed that, when properly dimensioned, a detention basin can discharge an effluent in which the concentrations of hazardous substances, originating from motor vehicle traffic, have been reduced by 50 percent to 80 percent through sedimentation and separation processes. Thus, quality requirements for discharges into natural bodies of water can be adhered to. (Author's abstract)

BALANCE OF REPRESENTATION IN WATER PLANNING: AN ASSESSMENT OF EXPERIENCE FROM NORTH CAROLINA.
Florida State Univ., Tallahassee. Dept. of Urban and Regional Planning.
B. Stiftel.
Environmental Science and Technology ESTHAG, Vol. 24, No. 9, p 105-120, September 1990. 3 tab, 34 ref.

Descriptors: *North Carolina, *Project planning, *Public participation, *Water resources management, Nonpoint pollution sources, Public policy, Public relations, Water pollution control, Water quality control.

Over-representation of private interests and under-representation of public interests has been endemic in citizen participation in water planning in the USA for many years. Attempts to correct this imbalance in interest representation have not been successful. Such failure is explained by showing that traditional perceptions may not be valid. Empirical evidence from the North Carolina nonpoint pollution control planning program is used. Categories of public and private participants are developed. Agency staff interpretation of representation are reported. Staff believed that private participants were heavily over-represented. The participant categories were tested with staff interpretations tested against participant attitudes. Suprisingly, participant attitudes do not support the staff interpretations. Limitations in traditional categorizations of interests were identified and it was suggested that participants respond to a wide array of incentives and disincentives, not just material rewards. Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 215-255, June 1990. 3 tab, 1 ref.

Descriptors: *Comprehensive planning, *Management planning, *Water conveyance, *Water treatment facilities, Budgeting, England, Operating policies, Performance evaluation, Projections, Utilities.

Asset management planning has been developed over the last 2 years in response to the needs of the UK water industry as a natural progression from existing engineering planning and accounting practices, to provide more detailed consideration of future investment needs. The six parts of an asset management plan include: procedures for preparing the asset management plan; statement of utility's relevant standards and policies; list of asset systems; information on the performance and condition of principal components of each system; long-term (20-year) investment estimates; and short term (5-year) detailed investment program. In order to achieve and continue to maintain asset management plans, it is necessary to consider the organization and control of the planning functions. Continued re-appraisal of both engineering and accounting objectives is required to ensure a satisfactory result. It is concluded that asset management planning provides an effective method of determining long-term investment needs and is of major benefit in the day-to-day management of a utility. Group 6A—Techniques Of Planning

The first installment of a four part series describes the application of decision analysis to engineering design for projects in which the geohydrological environment plays an important role. The methodology is well suited to the design of contaminant facilities and new waste management facilities, purge-well networks in contaminant remediation applications, or drainage systems in geotechnical projects. The method is based on a risk-based philosophy of engineering design, and involves the coupling of three separate models: a decision model based on risk-cost-benefit objective function, a simulation model for groundwater flow and transport, and an uncertainty model that encompasses both geological uncertainty and parameter uncertainty. The approach can be used for the comparison of alternative engineered components of a system, for the design of monitoring systems, and for the assessment of data worth in design of site investigation programs. This first paper lays the framework; the subsequent papers describe how the methods can be applied in geotechnical and waste management applications. (Author's abstract)

6B. Evaluation Process

ENVIRONMENTAL EVALUATION PROCEDURE FOR COASTAL DEVELOPMENTS IN SOUTH AFRICA.
Cape Town Univ. (South Africa). Environmental Evaluation Unit.
M. R. Sowman.
Ocean & Shoreline Management OSMAE6, Vol. 14, No. 2, p 133-150, 1990. 2 fig, 4 tab, 19 ref.

Descriptors: *Coastal zone management, *Decision making, *Evaluation, *Public participation, *Regional development, *Resources management, *South Africa, Economic aspects, Human population, Legal aspects, Political aspects, Recreation.

The South African coastline represents an area of intense development pressure. Rapid population growth as well as changing political and socio-economic conditions have resulted in increased demands on coastal land, especially for the development of holiday housing and recreation resorts. Until recently, developers and authorities have encouraged and satisfied these demands without rigorous environmental or developmental constraints. Inevitably, this haphazard and unrestrained approach has led to degradation to coastal resources. The root cause of this is the lack of a formal, structured approach for evaluating the environmental implications of development applications. In response to these problems, a systematic procedure for evaluating the environmental suitability and social desirability of development proposals has been developed to ensure that environmental considerations are routinely integrated into the planning, development and decision-making process; the right questions are asked; the developer becomes more involved with, and responsible for, the development proposal; the public are involved in the planning and decision-making process; costly delays are reduced; applications are processed more efficiently; and the process of decision-taking is improved. APPLICATION OF THE HSPF MODEL TO WATER MANAGEMENT IN AFRICA.
University of the Pacific, Stockton, CA. School of Engineering.
R. C. Johanson.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 102-109, 13 fig, 5 ref.

Descriptors: *Hydrological Simulation Program-Fortran, *Model studies, *South Africa, *Water management, *Water quality, Computer models, Management planning, Mgeni Basin, Rural areas, Simulation analysis, Water quality management.

The Hydrological Simulation Program-Fortran (HSPF), performs a deterministic simulation of hydrology and water quality, for watersheds of arbitrary complexity. Like any such model, HSPF requires calibration data. Thus, most applications (especially for water quality) have been in North America and Europe. However, HSPF was recently applied to two catchments in S. Africa. One was small (90 ha) and highly urbanized; the other was much larger (300 sq km) and rural. The results of simulations involving hydrology, sediment and phosphorus were very satisfactory. Therefore, this type of modeling will be continued in South Africa, with the goal being to help manage water and constituent cycling in the larger Mgeni basin (approximately 4000 sq/km), which serves as the water supply and effluent conduit for several rapidly expanding urban centers, as well as numerous rural villages. The use of the HSPF model in subcatchments of the Mgeni catchment gave local practitioners some valuable experience in using a comprehensive model; the ease with which time series could be stored and processed and the versatility of the model were readily accepted. However, efficient use of the model requires considerable effort in becoming acquainted with the modeling approach, data management techniques, etc. (See also W91-01188) (Lantz-PTT)

SOME PUBLIC ATTITUDES ABOUT HEALTH AND THE ENVIRONMENT.
Roper Organization, Inc., New York.
R. H. Baxter.
Environmental Health Perspectives EVHPAZ, Vol. 86, p 261-269, June 1990. 13 tab.

Descriptors: *Environmental protection, *Public health, *Public opinion, *Surveys, Data interpretation, Public rights, Regulations.

Public opinion is formed both by long-term developments and by single unanticipated events. This suggests that readers of opinion survey findings should note field interviewing dates and further determine what the news media have been reporting about relevant developments and events. Personal health and the cost of health care are high on the public's agenda; this is an important backdrop for any review of public attitudes and priorities related to health and the environment. Americans increasingly believe that they are not spending enough on environmental protection and improvement. Surveys have shown that the more people perceive an environmental threat to their safety, well being and health, the more they will want regulation or industry action to meet the threat. There is high public concern over hazardous waste disposal and the transport and use of toxic materials in manufacturing and processing, industrial accidents involving release of pollutants, the leakage of chemical waste into the soil, and the pollution of water and air from industrial sources. Data collected supports the assumption that for the foreseeable future these and certain other ecological dangers will be seen as serious by large majorities of Americans. (Lantz-PTT)

MULTIDIMENSIONAL SIMULATION APPLIED TO WATER RESOURCES MANAGEMENT.
Universidade Nova de Lisboa (Portugal). Environmental Systems Analysis Group.
A. S. Camara, F. C. Ferreira, D. P. Loucks, and M. J. Seixas.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1877-1886, September 1990. 11 fig, 5 tab, 36 ref.

Descriptors: *Cleanup, *Decision making, *Fate of pollutants, *Model studies, *Oil spills, *Planning, *Project planning, *Water resources management, Mathematical models, Simulation.

A framework for an integrated decision aiding simulations (IDEAS) methodology using numerical, linguistic, and pictorial entities and operations has been developed. IDEAS relies upon traditional numerical formulations, logical rules to handle linguistic entities with linguistic values, and a set of pictorial operations. Pictorial entities are defined by their shape, size, color, and position. Pictorial operators include reproduction (copy of a pictorial entity), mutation (expansion, rotation, translation, change in color), fertile encounters (intersection, reunion), and sterile encounters (absorption). Interaction between numerical, linguistic, and pictorial entities is handled through logical rules or a simplified vector calculus operation. This approach is shown to be applicable to various environmental and water resources management analyses using a model to assess the fate and impacts of an oil spill. Future developments include the implementation of IDEAS implementation on parallel processing machines. (Author's abstract)

Making wise investments is the goal of every investor. This is certainly true for public utilities as they invest in infrastructure to fulfill their mission of providing safe, reliable, cost-efficient service to their customers. Starting from a capacity deficit condition, the city of Austin, Texas, faced a boom-and-bust development cycle in the 1980s that made sizing and timing decisions for new water and wastewater facilities extremely difficult. Infrastructure and investment decisions were examined for a decade in which Austin experienced a 30% increase in demand, followed by five years of almost no growth. Basic demand-versus-capacity relationships were addressed first. The unusual rates of development activity describe the investment climate. The making of investment decisions was affected by service policies, rate impacts, environmental considerations, and political considerations, including revenue bond voting and the formation of municipal utility districts. Austin's experience calls attention to the importance of certain basic infrastructure planning guidelines, and are lessons learned. (Author's abstract)

RESPONSE OF COASTAL ZONE MANAGEMENT PROGRAMS TO SEA LEVEL RISE IN THE UNITED STATES.
Washington Univ., Seattle. Inst. for Marine Studies.
P. Klarin, and M. Hershman.
Coastal Management CZMJBF, Vol. 18, No. 2, p 143-165, 1990. 2 tab, 119 ref.

Descriptors: *Coastal zone management, *Environmental policy, *Global warming, *Sea level, *Sea level rise, *Water resources management, Erosion, Institutions, Land use, Legislation, Management planning, State governments, United States.

State coastal zone management programs are responding to the potential impacts of accelerated sea level rise through a wide range of activities and policies. The federal Coastal Zone Management Act provides a basis for coastal state regulatory activities. State Coastal Zone Management Program (CZMP) responses to concerns about accelerated eustatic sea level rise were classified into four categories: official recognition and assessment of problems and issues; new public and intergovernmental processes; existing adaptable legislation; and new policies responding to sea level rise. Of 24 coastal states, 16 were credited with formal recognition of the problem, while only 3 have implemented new policies addressing the issue. Alternative policy responses to sea level rise included zoning restrictions, economic incentives/disincentives, prohibitions or restrictions on development, nonstructural engineering, and groundwater protection policies. Linking sea level rise to more immediate and tangible issues, such as coastal erosion, storm protection, public recreation, and access, provides an opportunity for CZMPs to increase their role in coastal land use policy. Programs that are able to incorporate sea level rise considerations into their overall program objectives will succeed in broadening the scope and range of the planning process. (MacKeen-PTT)

EYE TO EYE WITH HURRICANE GLORIA ON VIRGINIA'S TANGIER ISLAND.
Old Dominion Univ., Norfolk, VA.
C. Friberg, D. J. Zeigler, and G. K. Fortner.
Coastal Management CZMJBF, Vol. 18, No. 2, p 157-178, 1990. 2 fig, 3 tab, 30 ref.

Descriptors: *Coastal zone management, *Emergency planning, *Hurricanes, *Management planning, Chesapeake Bay, Evacuation, Hurricane Gloria, Natural hazards, Surveys, Tangier Island, Virginia.

A field survey on Tangier Island in the Chesapeake Bay and interviews with emergency management officials in Virginia have provided a base on which to assess and interpret the evacuation response of the resident population when threatened by Hurricane Gloria in 1985. Because of their finely tuned recognition of environmental hazards, most islanders responded to an evacuation advisory by leaving the island. The pattern of evacuation response, including choices of evacuation destinations and transit mode off the island, however, indicated a decision-making process that did not conform to the expectations of emergency officials, but betrayed an understanding of human-environment interaction and insights that needs to be incorporated into the emergency planning process. CALIFORNIAZATION OF ARIZONA WATER POLITICS.
W. Parsons, and D. Mathews.
Natural Resources Journal NRJOAB, Vol. 30, No. 2, p 341-359, 1990. 37 refs.

Descriptors: *Arizona, *California, *Groundwater management, *Policy making, *Resources development, *Water allocation, *Water policy, Decision making, Institutions, Political aspects, Regional development.

An analysis of Western water policy suggested that an elite core of decision makers establishes the values, determines the agenda and controls the conditions under which water policy is made. The core elite are primarily urban business leaders who guide water resources development as a means of promoting urban growth and development. Semicore actors include agriculture, San Diego, and Arizona. The history of Western water policy was seen as being divided into four stages: (1) the foundation of the elites (1880s to 1920s); (2) the rise of the elites (1920s to 1930s); (3) the golden age of concrete (1930s to 1960s); and (4) maintaining elite controls (1970s to present). In the West, a small group of growth and development interests comes to dominate water policy. Furthermore, water policy making in Arizona resembles water policy making as practiced in Southern California, particularly in the continued control of the water agenda. (Author's abstract)

MAR DEL PLATA ACTION PLAN: REVIEW OF PROGRESS OF IMPLEMENTATION IN ASIA AND THE PACIFIC.
Water Resources Journal, No. 163, p 1-35, December 1989. 20 tab.

Descriptors: *Developing countries, *Planning, *Water conservation, *Water quality management, *Water resources development, *Water supply development, Agricultural water, Conservation, Data acquisition, Data interpretation, Economic aspects, Flood control, Governmental interrelations, Legal aspects, Regional planning, Water pollution control.

The Mar del Plata Action Plan was formulated to help participating countries plan and implement efficient programs for the use, management and conservation of water. In May 1988, the U.N. General Assembly issued a questionnaire to review the overall progress in implementing The Plan, to identify measures to improve U.N. support, and to promote exchange of information among member states. Countries and areas responding as of June 1989 were Australia, Bangladesh, Guam, Hong Kong, India, Indonesia, Japan, Maldives, Myanmar, the Philippines, the Republic of Korea, Samoa, Singapore, Sri Lanka, Thailand and Vanuatu. The survey indicated that most of the countries and areas had a national water policy reflecting the priority attached to water resources development within the national development plans. Problems of renovation of major project structures were experienced or anticipated. Most areas had legislation dealing with ownership and use of surface and groundwater, but felt that it was insufficient or incompatible with development plans. Six countries or areas had multilateral/bilateral agreements for the development of shared water resources. All areas reported networks for climatological and hydrological data collection with varying degrees of adequacy and reliability. Floods are a major concern, although most areas do not have adequate structural or non-structural measures. The survey indicated that constraints in the implementation of agricultural water development programs were due to lack of qualified manpower, shortage of financial resources, institutional deficiencies and lack of equipment. Virtually all reporting countries indicated that multilateral and bilateral cooperation would assist in overcoming constraints. Lack of financial resources was considered the major constraint in the area of research. Most reporting countries and areas were willing to participate in establishing joint regional or subregional organizations or institutions. (Miller-PTT)

REGIONAL OVERVIEW OF WATER QUALITY MONITORING.
Water Resources Journal, No. 163, p 95-108, December 1989. 9 tab.

Descriptors: *Developing countries, *Planning, *Regional planning, *Water quality management, *Water resources development, Economic aspects, Legal aspects, Water pollution control.

In a survey conducted by the Economic and Social Council for Asia and the Pacific (ESCAP) (1988-89) on water quality monitoring in the region, a total of 31 countries/areas responded, more than twice as many as in a similar survey conducted in 1980, indicating the growing concern and interest in the subject. Almost all countries/areas reported having some programs for monitoring water quality. The results of the analysis are presented, showing the status of legal, institutional and budgetary allocations for control, monitoring and management of water quality. No less than eight countries still did not have any legal instrument or national legislative policy for water quality monitoring and management. Eight other countries reported that existing legislation was inadequate to deal with the problem of pollution. Almost all countries, including Australia and New Zealand, reported that budgetary allocations were not adequate for effective control of water and environmental pollution in their countries. All regional developing countries reported lack of trained manpower, modern technology and equipment. Interest was expressed by all countries or areas in participating in regional seminars or workshops, and also in exchanging information on up-to-date developments in the field of water quality monitoring. Descriptors: *Developing countries, *Domestic water, *Economic aspects, *Nigeria, *Rural areas, *Water costs, *Water use, Cost recovery, Public policy, Social aspects, Water supply development.

In-depth interviews were conducted with 395 households in three rural communities in the Nsukka district of Anambra State, Nigeria, concerning their household water use practices, water expenditures to vendors, willingness to pay for improved water supplies, and household socioeconomic characteristics. Households in Nsukka district do not want to pay for water in advance or commit themselves to a fixed monthly payment for water. They want the freedom to buy water only when they use it, partly due to the seasonal nature of water use and partly because they want control over their cash flow in order to meet other more immediately pressing needs. Equally important, they do not trust government to provide a reliable public water supply. They do not want to pay in advance for a service they are not sure they will ever get. If they are required to pay a fixed fee every month, households are willing to pay only relatively small amounts for improved services, even less than they are currently paying water vendors. Current arrangements for cost recovery, fixed monthly fees for both public taps and unmetered private connections, are inappropriate. Kiosk systems, or kiosk systems with metered private connections for some households, are the most promising way to improve cost recovery and meet consumers' cash flow needs. (Author's abstract)

6D. Water Demand

STEPWISE TIME SERIES REGRESSION PROCEDURE FOR WATER DEMAND MODEL IDENTIFICATION.
Pellissippi International, Inc., Knoxville, TN.
S. P. Miaou.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1887-1897, September 1990. 1 fig, 8 tab, 22 ref.

Descriptors: *Model studies, *Statistical models, *Water demand, *Water use, Regression analysis, Time series analysis.

Annual time series water demand has traditionally been studied through multiple linear regression analysis. Four associated model specification problems have long been recognized: (1) the length of the available time series data is relatively short, (2) a large set of candidate explanatory or 'input' variables needs to be considered, (3) input variables can be highly correlated with each other (multicollinearity problem), and (4) model error series are often highly autocorrelated or even nonstationary. A stepwise time series regression identification procedure has been proposed to alleviate these problems. The proposed procedure adopts the sequential input variable selection concept of stepwise regression and a previously published 'three-step' time series model building strategy. Autocorrelated model error is assumed to follow an autoregressive integrated moving average (ARIMA) process. The stepwise selection procedure begins with a univariate time series demand model with no input variables. Subsequently, input variables are selected and inserted into the equation one at a time until the last entered variable is found to be statistically insignificant. The order of insertion is determined by a statistical measure called between-variable partial correlation. This correlation measure is free from the contamination of serial autocorrelation. Three data sets from previous studies (Oklahoma City and Tulsa, OK, and Tucson, AZ) were used to illustrate the proposed procedure. (Author's abstract)

DEMAND-BASED BENEFIT-COST MODEL OF PARTICIPATION IN WATER PROJECT.
Arizona Univ., Tucson. Dept. of Economics.
R. B. Billings.
Journal of Water Resources Planning and Management (ASCE) JWRMD5, Vol. 116, No. 5, p 593-609, September/October 1990. 1 fig, 5 tab, 42 ref.

Descriptors: *Cost-benefit analysis, *Model studies, *Water demand, *Water resources development, *Water use efficiency, Arizona, Rate of return, Regression analysis, Urban planning, Water rates, Water resources management, Water use.

Numerous economists and water resource specialists have advocated the use of demand-based consumer's-surplus measures to determine the benefits of possible new water supplies and other water-related projects. This benefits model was estimated for the projected arrival of Central Arizona Project (CAP) water in Tucson, Arizona, using the parameters of a regression-based demand model. The estimated benefits to water users of the anticipated CAP water are $91 million compared to costs of $175 million at the 8.625% discount rate currently required for federal projects. Thus direct costs exceed direct benefits by $84 million over the 100 year life of the project. To keep current water customers from suffering net losses, a payment of $2,514 in 1985 dollars would be required from each new housing unit over the 100 year life of the project. The internal rate of return for the project is 4.86%, which exceeds the 3.25% rate used in the original analysis of the project. Thus, the practical application has been demonstrated of the frequently-advocated but less frequently-used consumer-surplus model in estimating the benefits of increasing the supply of urban water. MODELING TO GENERATE RECREATIONAL ALTERNATIVES.
Colorado State Univ., Fort Collins. Water Resources Research Inst.
M. Flug, D. G. Fontane, and G. A. Ghoneim.
Journal of Water Resources Planning and Management (ASCE) JWRMD5, Vol. 116, No. 5, p 625-638, September/October 1990. 4 fig, 2 tab, 18 ref.

Descriptors: *Model studies, *Recreation demand, *River flow, *Water resources management, *Water use, Boating, Dynamic programming, Fishing, Linear programming, Optimization, Watershed management, West Virginia.

Water resource managers are often faced with the task of balancing recreational activities in an attempt to maximize the overall recreational benefits from a river system. Available recreation-use functions for white-water rafting, boating, and fishing as a function of river flow are used to estimate benefits. Optimization models were used to generate alternatives (MGA) that maximize total recreational activities. Monthly river-flow scenarios that produce different mixes of the three recreational activities, yet ave essentially the same value of total recreational benefits, were sought. Four MGA methods were evaluated with data for the New River Gorge National River in West Virginia. Two of the MGA methods were based on linear programming, and two were based on dynamic programming. It was found that the MGA methods based on dynamic programming were easier to use and modify. The dynamic programming method provides optimal and alternative solutions over the entire flow range of the New River Gorge. (Author's abstract)

R. C. Peralta, and B. Datta.
Journal of Water Resources Planning and Management (ASCE) JWRMD5, Vol. 116, No. 5, p 676-692, September/October 1990. 2 fig, 4 tab, 23 ref.

Descriptors: *Alternative planning, *Aquifer management, *Groundwater use, *Pumping, *Water resources management, Arkansas, Cropland, Flow control, Groundwater movement, Louisiana, Political aspects, Potentiometric surface, Social aspects, State jurisdiction, Water use.

For any large groundwater use area there are an infinite number of feasible sustainable groundwater withdrawal strategies. Also, there are generally several water management objectives. Alternative explicit planning objectives are: (1) maximize total pumping from the underlying aquifer while causing the evolution of a steady potentiometric surface; and (2) maintain a prespecified target potentiometric surface. Implicit objectives involve controlling stream/aquifer interflow and water flow across a state boundary, and attempting to avoid gross disruption of current cropping patterns. Models, bounds, constraints, and data are formulated. Alternative optimal strategies and the rationale for preferring one strategy were developed for a region in Arkansas. The objective of maintaining the relatively unstressed target potentiometric surface yielded politically and socially unacceptable water use strategies. The most acceptable strategy maximized sustainable groundwater extraction, maintained recent groundwater flow to Louisiana, maintained current potentiometric surface heads at the Louisiana-Arkansas border, maintained more than minimally acceptable surface water flow to Louisiana, and approximately maintained current cropping distributions. Developed planning models utilized the embedding approach, over 300 pumping variables, and 700 total variables, indicating the utility of the embedding method for regional sustained yield (steady-state) planning. (Author's abstract)

WATER SUPPLY OR WATER DEFICIENCY.
Dufresne-Henry, Inc., Westford, MA.
M. L. Wetzel.
Water Engineering and Management WENMD2, Vol. 137, No. 8, p 24-26, August 1990. 2 fig.

Descriptors: *Management planning, *Water resources management, *Water supply development.

In the late 1980s, many New England communities experienced water supply shortages that could have been avoided through proper water supply planning and management. While planning will not predict the problems that cause shortages, it will assure that the system is developing new supplies ahead of increased demands and has sufficient capacity to operate in emergency situations. The water supply requirements of a public water system can be predicted by studying past water-use trends in conjunction with detailed planning and zoning data. The two most important trends to evaluate are the maximum day/average day demand ratios and the per service consumption (residential, commercial, industrial, and municipal). Predicting maximum day demand is the most important aspect of water supply planning in order to size groundwater supplies, treatment facilities, pumping equipment, and transmission water mains. The final step in developing water supply projections requires input from the water department, town planning board, and/or local planning agency, to identify potential growth within the existing and future water-system-service areas. Water supply projections should be updated every year, which can be easily performed using a computer. Water supply planning helps provide a safe and adequate supply for both existing and future customers of the water system. Development of new sources requires planning, engineering investigation, regulatory approvals, design, and construction. This process can take several years depending upon the type of supply and treatment facilities required. Therefore, a water department must consider both short-term and long-term solutions for meeting its water supply requirements. (Fish-PTT)

CHANGES IN WEST AFRICAN SAVANNA AGRICULTURE IN RESPONSE TO GROWING POPULATION AND CONTINUING LOW RAINFALL.
International Crops Research Inst. for the Semi-Arid Tropics, Patancheru (India).
H. 1. D. Vierich, and W. A. Stoop.
Agriculture, Ecosystems and Environment AEENDO, Vol. 31, No. 2, p 115-132, June 1990. 4 fig, 4 tab, 42 ref.

Descriptors: *Agricultural practices, *Burkina Faso, *Irrigation practices, *Land use, *Rainfall, *Water conservation, *Water use, Fertilizers.

Changes in village farming systems, brought about by population growth and continuing low rainfall, are described for the three main agro-ecological zones in Burkina Faso: the Sahel, Sudanian and Guinean zones.The toposequential land use and cropping patterns were used as the basis for a model, which describes the long-term ecological degradation caused by declining proportions of fallow land and over cropping. Several earlier studies have emphasized the flexibility of traditional African agricultural systems. Increasing population pressure and an extended cycle of low rainfall years starting in 1970, have had impacts on farming in Burkina Faso with serious land degradation, particularly for uplands in the Sahelian and North Sudanian zones as a consequence. The Guinean zone, because of its higher rainfall, was less affected, although the same process of fertility depletion and soil crusting of uplands which have caused the serious situation in the north, have also been set in motion in the south. To offset these trends, farmers in all three zones have been introducing more intensive practices (manure and fertilizer use, irrigated gardens, moisture conservation practices) and earlier maturing cereal cultivars. SINGLE-STAGE AND TWO-STAGE DECISION MODELING OF THE RECREATIONAL DEMAND FOR WATER.
Economic Research Service, Washington, DC. Resources and Technology Div.
... T. Hansen, and J. A. Hallam.
Journal of Agricultural Economics Research, Vol. 2, No. 1, p 16-26, Winter 1990. 1 fig, 4 tab, 26 ref.

Descriptors: *Fisheries, *Model studies, *Recreation, *Water demand, Competing use, Decision making, Fishing, Water supply.

Past rivalry over access to water has usually been between the farmers who irrigate, and new agricultural, industrial and municipal demands. Recently, the recreational demand for water has become another consideration in water allocation decisions. The significance of the recreational demand for water as a fishery resource is examined in this study by applying two different frameworks to the decision to fish recreationally. The consistency of the estimated responses to changes in fishery resources across both decision frameworks testifies to the importance of streams as a recreational fishery resource. Modeling behavior within the household production framework allows all downstream effects to be estimated, not just impacts at particular sites. Marginal values of water as a recreational fishery resource are estimated based on daily values of fishing derived in prior research. (Author's abstract)

QUEENSLAND RAINFOREST AND WETLANDS CONFLICT: AUSTRALIA'S EXTERNAL AFFAIRS POWER--DOMESTIC CONTROL AND INTERNATIONAL CONSERVATION.
Lewis and Clark Coll., Portland, OR. Northwestern School of Law.
T. H. Edmonds.
Environmental Law EVLWA8, Vol. 20, No. 2, p 387-413, 1990. 124 ref.

Descriptors: *Australia, *Conservation, *Environmental protection, *Federal jurisdiction, *International law, *Queensland, *Rain forests, *Resource management, *State jurisdiction, *Wetlands, Legal aspects, Political aspects, Public participation, Tasmanian Dam decision, United Nations, World Heritage sites.

The federal government of Australia exercised environmental protective power by registering a 3500 square mile Queensland rainforest region with UNESCO's World Heritage Committee and legislating to prevent further timber cutting. This exercise of power sparked a fierce battle between the federal and the State of Queensland governments. The protection, however, is legally valid and met with the popular approval of the Australian electorate. Australia's High Court paved the way for the federal government's successful action with its 1983 Tasmanian Dam decision. This decision authorized the same protective federal legislation as a proper implementation of a treaty, the World Heritage Convention, under the Australian Constitution's external affairs power. The government's exercise of power and the Tasmanian Dam decision are unique because they represent the only worldwide legal test of World Heritage protection. Furthermore, Australia's use of external affairs power to protect the environment is different from United States action, which is so heavily reliant on broadened commercial power. Australia's action provokes observance of the potency of World Heritage protection, and thus elicits questions for future expansion of World Heritage protection of endangered natural areas throughout the world. Australia's example also allows portrayal of World Heritage obligations and possibilities. Australia's action is progressive as a globally emerging nation, and sets an example for other nations faced with internal power struggles to protect the environment. (Author's abstract)

RISK PERCEPTION IN INTERNATIONAL RIVER BASIN MANAGEMENT: THE PLATA BASIN EXAMPLE.
Reid, Collins and Associates Ltd., Vancouver (British Columbia).
J. O. Trevin, and J. C. Day.
Natural Resources Journal NRJOAB, Vol. 30, No. 1, p 87-105, Winter 1990. 66 ref.

Descriptors: *International agreements, *International law, *International waters, *Rio de la Plata Basin, *Risk assessment, *Watershed management, Argentina, Bolivia, Brazil, Jurisdiction, Paraguay, Political constraints, Relative rights, Rio de la Plata Basin Treaty, Treaties.

Perception of the risk of multilateral cooperation has affected joint international action for the integrated development of the Plata River Basin. The origins of sovereignty concerns among Argentina, Bolivia, Brazil, Paraguay, and Uruguay are explored in terms of their historical roots, which caused rival nations to interpret certain integrating actions as risky. The Plata Basin Treaty is a result of both the common acceptance by all the Plata nations of the mutual advantages of international cooperation in basin development, and of the particular ways in which the treaty provisions allayed the apprehensions of some states. The role of risk in determining the character of the Plata Basin Treaty, and the ways in which risk was managed in order to reach cooperative agreements, are analyzed. The treaty incorporates a number of risk management devices (nonbinding arrangement, the division of the agreement and inclusion of secondary matters, a provision for unilateral denunciation, the unanimity requirement in collective decision making, and an agreement to agree on the ways of implementing future cooperation) that were necessary to achieve international cooperation. The institutional system implemented under the treaty produced few concrete results for almost two decades. Within the current favorable political environment in the basin, however, the structure already in place reopens the possibility of further rapid integrative steps. (Brunone-PTT)

IN RE WATER OF HALLETT CREEK SYSTEM.
M. Basham.
Natural Resources Journal NRJOAB, Vol. 30, No. 1, p 187-201, Winter 1990.

Descriptors: *California, *Federal jurisdiction, *Judicial decisions, *Riparian rights, *State jurisdiction, *Water law, *Water rights, Land tenure, Land use, Legal aspects, Legislation.

In In re Water of Hallett Creek System (Hallett Creek), the California Supreme Court held that on federal reserved lands, the United States has state riparian water rights to be used for secondary purposes. The Hallett Creek decision re-opens the question of the impact of the Desert Land Act upon the nonnavigable waters of the West, an issue once thought to be settled by the United States Supreme Court's decision in Beaver Portland Cement. In addition, this holding raises the issue of whether the United States may be treated as an ordinary landowner thereby receiving benefits from state law, and, if so, whether subsequent changes in state law can deprive the United States of these benefits. Consequently, the Hallett Creek decision creates more questions than it answers. It remains to be seen how subsequent decisions answer them. (Author's abstract)

MARINE RESERVE MANAGEMENT IN DEVELOPING NATIONS: MIDA CREEK--A CASE STUDY FROM EAST AFRICA.
Exeter Univ. (England). Dept. of Biological Sciences.
A. D. Kennedy.
Ocean & Shoreline Management OSMAE6, Vol. 14, No. 2, p 105-132, 1990. 16 fig, 3 ref, 23 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Africa, *Developing countries, *Mida Creek, *Resources management, *Water pollution, Coastal zone management, Conservation, Environmental protection, Recreation, Tourism, Wildlife.

Mida Creek, part of the longest established marine national reserve in Africa, is used to illustrate contemporary problems facing coastal zone managers in developing nations. Activities performed in the creek by tourists, expatriates and indigenous people are having deleterious effects including pollution, over-exploitation, loss of wildlife and the destruction of natural habitat. Despite management policies designed to protect the creek's resources, considerable overexploitation and associated damage is still occurring. Suggestions are made for improved management techniques, and reconciliation of the conflicting needs of conservation, exploitation and recreation. Despite strong economic pressure, the future of the area lies in the conservation of its biotic resources. To attract tourists, and to continue to provide for the needs of the local people, Mida Creek needs first and foremost to be protected as a reserve for wildlife. (Author's abstract)

UNITED STATES V. LARKINS: CONFLICT BETWEEN WETLAND PROTECTION AND AGRICULTURE; EXPLORATION OF THE FARMING EXEMPTION TO THE CLEAN WATER ACT'S SECTION 404 PERMIT REQUIREMENTS.
K. E. Varns.
South Dakota Law Review, Vol. 35, No. 2, p 272-297, 1990. 169 ref.

Descriptors: *Agricultural runoff, *Clean Water Act, *Environmental protection, *Judicial decisions, *Permits, *Water law, *Wetlands, Agricultural practices, Cultivated area, Drainage effects, Federal jurisdiction.

Section 404 of the Clean Water Act requires a dredge and fill permit whenever dredge or fill material is deposited into any of the 'Waters of the United States'. However, the Clean Water Act exempts incidental discharges into 'waters of the United States' resulting from normal, ongoing types of farming activities. United States v. Larkins, presented the Sixth Circuit United States Court of Appeals with the issue of whether the Clean Water Act's farm exemptions applied when the landowners replaced one type of wetland crop with another type of wetland crop, eventually draining and filling the wetland area of his property. The Sixth Circuit held that the farming exemption to section 404's permit requirement is not applicable when a farmer switches from one wetland crop to another thereby causing wetland to be filled. Where an area served primarily wetland functions, even though adjacent to farming activities, the courts have consistently found that if the effect of the change in land use is to convert extensive areas of water into dry land, the conversion is not a 'normal' farming or silviculture activity within the meaning of section 404(f)(1). The court in Larkins followed the same approach in examining the consequences of the landowner's activity. Even though the Larkins used the bottomlands for silviculture and some row crop cultivation prior to draining and filling the land, the court refused to hold that the conversion to dry land fell within the section 404 permit exemption. The holding in Larkins is consistent with the general approach used by other courts and is consonant with Congress' intention that the farming exemption be construed narrowly. (Brunone-PTT)

IS THERE A RESERVED WATER RIGHT FOR WILDLIFE ON THE WIND RIVER INDIAN RESERVATION: A CRITICAL ANALYSIS OF THE BIG HORN RIVER GENERAL ADJUDICATION.
D. M. Stanton.
South Dakota Law Review, Vol. 35, No. 2, p 326-340, 1990. 148 ref.

Descriptors: *Big Horn River, *Federal jurisdiction, *Judicial decisions, *Reservation doctrine, *Water law, *Water rights, *Wildlife, Agriculture, History, Indian reservations, Legal aspects, Wildlife habitats, Wyoming.

In In re the Rights to Use the Water in the Big Horn River the Supreme Court of Wyoming held that Indian tribes occupying the Wind River Indian reservation and the United States were entitled to an award of reserved water rights quantified solely on the basis of an agricultural purpose for the Indian reservation dating from the time the reservation was created. This note contends that the court erred in failing to follow the Special Master's report wherein wildlife uses were included in the quantification of the reserved water rights award. The Wind River Indian Reservation was reserved from the public domain by the United States as the permanent home of the Eastern Shoshone and Bannock Tribes of Indians by the Second Treaty of Fort Bridger in 1868. Implicit in this reservation was a reserved water right in quantities necessary to fulfill the purposes for which the reservation was created. The 1868 Treaty encouraged agricultural development. However, the Treaty also provided for the use of the reservation as a permanent home for the Tribes, and specifically preserved hunting rights. As the Tribes subsisted on the indigenous wildlife at the time the Treaty was signed, and since both parties contemplated this means of subsistence into the indefinite future, the court should have awarded additional reserved water rights in an amount sufficient to maintain wildlife populations at historic levels on the reservation. ENVIRONMENTAL IMPACT ASSESSMENT: THE EXAMPLE OF MARINE BIOLOGY AND THE UK POWER INDUSTRY.
Central Electricity Generating Board, Fawley (England). Marine Biological Unit.
R. N. Bamber.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 270-274, June 1990. 1 fig, 9 ref.

Descriptors: *Electric power production, *Environmental impact statement, *Environmental policy, *Environmental protection, *Europe, *United Kingdom, Ecological effects, Electric powerplants, Regulations, Water resources development.

Environmental impact assessment (EIA) is a process which has been undertaken in some form by the Central Electricity Generating Board in the U.K. for many decades, both as a contribution to public enquiries for consent application and as a natural response to the statutory conditions of the Electricity Act of 1957. The formal title comes from the US originating in the National Environmental Policy Act of 1969. The Commission of the European Communities committed to an official EIA in 1988. The directive became law in July 1988 for any power generating plant with a heat output of 300 MW or more and may be required for smaller plants. The purpose of any single phase of an EIA is to produce the data necessary for the Environmental Statement (ES), which must form a cohesive whole as a procedure of collation, not correction. The ES must make the process of decision easier and meaningful to judges, lawyers, assessors, objectors, and officials. The steps for a biological EIA procedure are: (1) identify the site; (2) determine the fauna and flora, gather the data; (3) identify sensitive or important species or communities; (4) determine the relevant aspects of the development; (5) determine the potential interactions and degree of effect; (6) suggest minimizing or ameliorative procedures; and (7) define post-auditing of monitoring sites. EXPERT TESTIMONY FOR THE PLAINTIFFS IN THE CASE THAT BROUGHT OHIO GROUND-WATER LAW INTO THE 20TH CENTURY.
Ohio State Univ., Columbus. Dept. of Geology and Mineralogy.
E. S. Blair, and S. E. Norris.
Ground Water GRWAAP, Vol. 28, No. 5, p 767-774, September/October 1990. 8 fig, 13 ref.

Descriptors: *Groundwater management, *Ohio, *Water law, *Water use, Case studies, Competing use, Legal aspects, Water resources management.

The 1984 Ohio Supreme Court ruling on Cline v. American Aggregates changed Ohio's groundwater law from an 1861 ruling based on the English Rule of absolute ownership to a doctrine of reasonable use which recognizes that landowners have the privilege to use the water beneath their land, but can be held liable to others if their use of groundwater causes others unreasonable harm. The Ohio Supreme Court did not define unreasonable harm in the Cline case. As a result, unreasonable harm is being established through case law, the first such case being the relitigation of Cline v. American Aggregates. Depositions and expert testimony presented during the Cline cases, which represent a group of 56 landowners in a single lawsuit, showed the diverse ways in which the quantity and quality of groundwater used for domestic water supplies were affected by operation of a dewatering system at an aggregate mine. The testimony highlighted the complex interaction between regional hydrodynamics, variations in local geohydrologic settings, well construction methods, spatial variations in infiltration and recharge, and vertical leakage with the effects of the regional decline in water levels produced by the dewatering system. The decisions in the Cline cases recognized that groundwater is a common resource which needs to be shared and managed for the common benefit of all. The decisions are consistent with changes in groundwater laws in other midwestern states. (Lantz-PTT)

SUPPORTING WORLD HYDROLOGY: ACTIVITIES OF INTERNATIONAL HYDROLOGICAL PROGRAMS.
World Meteorological Organization, Geneva (Switzerland). Dept. of Hydrology and Water Resources.
J. C. Rodda.
EOS EOSTAJ, Vol. 71, No. 30, p 996-997, July 24, 1990. 2 fig, 12 ref.

Descriptors: *International agreements, *International hydrological decade, *Meteorological data, *Water resources development, Disasters, Forecasting, Foreign research, Hydrologic data, Institutions, Monitoring, Publications.

The 160 member countries of the World Meteorological Organization (WMO) are intimately involved in routinely observing, recording, analyzing, and forecasting the procession of hydrological phenomena (floods, droughts, soil erosion, pollution incidents, landslides, avalanches, river ice formation and breakup) that occur within their territories. These agencies are also involved in water resources assessment. The hydrological services

hat perform these tasks face the painstaking re-
cording of events and the utilization of tried and
ested methods for prediction and forecasting on a
egular basis: standardization of methods, the cre-
tion of archives, and the exchange of data. The
etworks they operate and the data they collect
rovide the essential ingredient of many research
rojects. WMO's activities in support of operation-
l hydrology include reports on flood frequency
nalysis and water quality monitoring; a Guide to
lydrological Practices; Technical Regulations; na-
onal testing of suspended sediment samplers, cur-
ent meters, and water level recorders; an inter-
omparison of 14 models from 11 countries; and 20
r so technical assistance projects in hydrology.
he Commission for Hydrology has agreed upon a
rogram that is being implemented by 32 rappor-
urs and working group members, and includes
ie International Decade for Natural Disaster Re-
uction and the issues of climate change. Impor-
nt to most, if not all, of these endeavors is the
nprovement in the knowledge and understanding
the hydrological cycle. (Fish-PTT)

oastal Management CZMJBF, Vol. 18, No. 2, p
5-141, 1990. 1 tab, 66 ref.

escriptors: *British Columbia, *California, Canada, *Coastal zone management, *Environ-ental policy, *Oregon, *Washington, *Water re-urces management, Governmental interrelations, stitutions, Legislation, Local governments, Man-ement planning, Resources development.

e basis for coastal zone management in the ited States is established in legislation. In com-rison, Canadian federal and provincial govern-nts have adopted a piecemeal approach for man-ng a variety of concerns examined here: water ality, ecological protection, public access, aes-tics, natural hazards, and water dependency. As esult of this approach, which is characterized by inimum of federal, provincial, and interjurisdic-nal coordination, the British Columbia coastal e is showing signs of stress. For example, major llfish harvesting areas are being lost to water lution; ecologically sensitive habitats are being sumed by urban, commercial, and industrial ansion; recreation and tourism opportunities are g impaired by clear cutting and other inappro-te developments; and infrastructure is allowed flood-prone and erosion-prone areas. Recom-dations to improve the approach to coastal agement in British Columbia include a variety nnovations. New federal and provincial poli-, legislation, institutions, and experimentation n local and regional integrated resource plan-g are required to better govern the coastal zone. reased support for existing agencies, public in-vement, and access to information as well as e common use of environmental impact studies needed to justify proposed coastal develop-ts. VIRONMENTALISM, POLICY FACTORS O THE COURTS IN NEW ZEALAND.
oria Univ., Wellington (New Zealand).
E. Fisher.
ironmental and Planning Law Journal JEX, Vol. 6, No. 4, p 316-331, December . 28 ref.

criptors: *Environmental policy, *Jurisdiction, gal aspects, *New Zealand, *Resources man-ent, Administrative agencies, Legislation, cy making.

ronmentalism, it was suggested, is simply an oach to decision making. This analysis is con-ed specifically with the changes that have place within the environmental legal system ew Zealand within the last five years. The Treaty of Waitangi is in form an agreement concluded in 1840 between the Crown and a group of Maori Chiefs guaranteeing the exclusive and undisturbed possession of their lands to the Chiefs and their Tribes. The Treaty of Waitangi is being increasingly recognized as an instrument of legal significance so that at some stage in the future it is likely to be seen as a formal impediment upon the legislative capacity of Parliament. In recent years, Parliament has enacted three major statutes with implications for environmentalism: (1) The Environment Act (1986) establishes the Ministry for the Environment and the Parliamentary Commissioner for the Environment; (2) The State-owned Enterprises Act (1986) provides for the formation, inter alia, of the Coal Corporation of New Zealand Ltd, the Electricity Corporation of New Zealand Ltd, the Land Corporation Ltd, and New Zealand Forestry Corporation Ltd; and (3) The Conservation Act (1987) established the Department of Conservation as a department of government. The New Zealand courts have, either independently of legislation or by the creative use of legislation, treated Maori cultural and spiritual values as matters relevant to environmental management. The significance of environmental perspectives, statutory statements of objective, and policy conflicts between environmental statutes have been practical difficulties faced by the New Zealand environmental legal system. ACCOMMODATING FISH AND WILDLIFE INTERESTS UNDER THE FPA.
Gordon, Thomas, Honeywell, Malanca, Peterson and Daheim, Seattle, WA.
J. A. Bearzi, and W. R. Wilkerson.
Natural Resources & Environment NRENEL, Vol. 4, No. 4, p 20-22,57-58, Spring 1990.

Descriptors: *Federal jurisdiction, *Fish conservation, *Hydroelectric plants, *Legislation, *Licensing, *Wildlife conservation, Administrative agencies, Legal aspects, Project planning.

The Federal Power Act (FPA), as amended by the Electric Consumers Protection Act of 1986 (ECPA) governs the licencing of hydroelectric projects by the Federal Energy Regulatory Commission (FERC). ECPA has significantly changed the relationships among electric power interests, environmental advocates, fish and wildlife interests, treaty tribes, and state and federal agencies. The new hydroelectric licencing and relicensing process under ECPA illustrates the cycle of Congress responding to pressure by interest groups before judicial solutions fully achieve what these groups seek. The major fish and wildlife provisions of the newly amended FPA require that: (1) the FERC give conservation interests equal consideration with developmental interests in licencing decisions; (2) where the project is within a reservation, the FERC adopt the recommendations of the federal agency managing the reservation; (3) a project must be 'best adapted' to a comprehensive plan for improving or developing a waterway; (4) licence conditions adequately protect, mitigate damages to, and enhance fish and wildlife; and (5) a licensee construct, maintain, and operate at its own expense such fishways as may be prescribed by the Secretary of the Interior or the Secretary of Commerce. The FERC relicensing consultation process consists of three stages: (1) prefiling consultation; (2) applicant identifies its internal licensing team; and (3) public information forums. Affected tribes must be included in the process from the outset and be treated as any other government agency. If policy makers cannot resolve their disputes, the consultation process allows the Director of the FERC Office of Hydropower Licensing to do so. It is recommended that applicants utilize every opportunity to settle fish and wildlife issues in prefiling consultation, in order to avoid the litigation-legislation cycle. (MacKeen-PTT)

CALIFORNIA V. FERC: STATE REGULATION OF FEDERAL HYDROPOWER.
T. J. P. McHenry, and J. D. Echeverria.
Natural Resources & Environment NRENEL, Vol. 4, No. 4, p 26-28,58-59, Spring 1990.

Descriptors: *California, *Federal jurisdiction, *Hydroelectric plants, *Judicial decisions, *State jurisdiction, Administrative agencies, Hydroelectric power, Legal aspects, Legislation, Licensing, Placerville, Project planning, Rock Creek, Water regulation, Water resources development.

On December 4, 1989, the United States Supreme Court granted the state of California's petition for certiorari in a case which will resolve whether the Federal Power Act (FPA) preempts state water regulatory laws or whether Congress intended that hydroelectric projects licensed by the Federal Energy Regulatory Commission (FERC) must comply with the requirements of state water law. The case arises from a hydropower project on Rock Creek, a tributary of the South Fork of the American River located near Placerville, California. The California State Water Resources Control Board (State Board) found that flow rates set by the FERC would greatly reduce the fishery habitat in Rock Creek and adopted permanent higher flow rates. The State of California, acting on behalf of the State Board, has taken the position that federally licensed hydropower projects must comply with state water rights law. The Supreme Court's analysis of the state role in regulating hydropower projects will turn on section 27 of FPA, which has been characterized as an 'antipreemption provision'. A congressional intent to defer to state regulation of water resources is revealed in the Federal Water Power Act, later incorporated into the FPA. In California v. United States (1978), the requirement for water leases for the protection of fish imposed by the State Board was upheld by the Supreme Court. A Ninth Circuit decision cited FERC's 'comprehensive hydropower planning authority' to support the conclusion that FERC is vested with exclusive jurisdiction over hydropower projects. Oral argument in California v. FERC was scheduled for March 20, 1990, and a decision was expected by the end of the term. (MacKeen-PTT)

URBAN CAPACITY SHARING: AN INNOVATIVE PROPERTY RIGHT FOR MATURING WATER ECONOMIES.
University of New England, Armidale (Australia). Centre for Water Policy Research.
N. J. Dudley.
Natural Resources Journal NRJOAB, Vol. 30, No. 2, p 381-402, 1990. 63 refs.

Descriptors: *Water allocation, *Water management, *Water rights, *Water supply, Administration, Economic aspects, Urban capacity sharing, Water demand, Water policy, Water users.

Researchers have previously proposed an innovative property right structure for sharing reservoir catchment water between groups of users and, in the case of irrigation farmers, between individual users. The concept is being implemented for sharing between groups. An urban version for individual consumers, urban capacity sharing, has a number of attractive features as an alternative property rights structure. Its introduction would create decentralized demand management with consumers taking the opportunity cost of water into account. It would be as if each user had his own small reservoir on his own small stream. Urban capacity sharing would provide a sound basis for achieving high levels of short and long

LIBRARY U. OF I. URBANA-CHAMPAIGN

run economic efficiency of water use. Its introduction into urban water economies would be easier and more beneficial if completed early in the water economy maturation process. (Author's abstract)

IN RE RIGHTS TO USE WATER IN THE BIG HORN RIVER 753P.2D76 (WYO. 1988).
P. Rogers.
Natural Resources Journal NRJOAB, Vol. 30, No. 2, p 439-458, 1990. 118 ref.

Descriptors: *Indian reservations, *Judicial decisions, *Legal aspects, *Water rights, *Water use, *Wyoming, Big Horn River, Federal jurisdiction, State jurisdiction, Water law, Wind River Reservation.

In 1977, the State of Wyoming initiated a suit destined to become the first general stream adjudication involving Indian reserved water rights completed under state jurisdiction. In In re Rights to use Water in the Big Horn River (Big Horn), decided in February 1988, the Wyoming Supreme Court quantified the reserved water rights of the Shoshone and Arapahoe tribes of the Wind River Reservation in northwestern Wyoming. The decision in Big Horn set the stage for future state adjudications of Indian reserved water rights. The court's strict application of the New Mexico primary purpose test in tandem with its narrow interpretation of the Second Treaty of Fort Bridger departed from accepted principles of federal law. Since the Wind River Reservation is the only Indian reservation in Wyoming, the decision may never be followed. However, other states faced for the first time with complex Indian water adjudications previously within the exclusive jurisdiction of the federal courts may find the Big Horn decision persuasive. If so, the decision may herald a shift away from liberal federal treaty interpretation in the Indian water rights context toward a more restrictive state view, unsupported by existing Supreme Court precedent. CITIZEN ENFORCEMENT OF CLEAN WATER ACT VIOLATIONS; THE SUPREME COURT STEERS A NEW COURSE OVER MUDDIED WATERS; GWALTNEY OF SMITHFIELD, LTD. V. CHESAPEAKE BAY FOUNDATION, INC.
S. J. Viscoli.
Natural Resources Journal NRJOAB, Vol. 30, No. 2, p 459-469, 1990. 75 ref.

Descriptors: *Clean Water Act, *Judicial decisions, *Public participation, *Water law, *Water pollution, Federal jurisdiction, Legal aspects, Legislation, Litigation, Water quality standards.

In Gwaltney of Smithfield, Ltd. v. Chesapeake Bay Foundation, Inc. the Supreme Court held that citizens may bring suit under the Federal Water Pollution Control Act (FWPCA) if they can make a good faith allegation of continuous or intermittent violations, but they may not bring suit for wholly past allegations. The Court's decision cleared up a three way conflict in the circuit courts' interpretation of the citizen suit provisions of the FWPCA. Between 1981 and 1984, the petitioner, Gwaltney of Smithfield, Ltd., discharged effluents in excess of its National Pollutant Discharge Elimination System (NPDES) permit. Respondents Chesapeake Bay Foundation and the National Resources Defense Council, both environmental groups, used FWPCA's citizen suit provision after first notifying the federal administrator and giving the state or federal authorities 60 days in which to enforce the NPDES violations. The Court's conclusion was based on an intricate explanation of the procedure Congress expected after the filing of the lawsuit and before the imposition of relief. In future, litigation is likely to focus on the gray area in between a past violation and a continuous violation. (MacKeen-PTT)

PERMIT REFORM THROUGH COASTAL CONSISTENCY PREVIEW: AN ANALYSIS OF ALASKA'S COORDINATED PROCESS.
Alaska Univ., Fairbanks.
T. J. Gallagher.
Coastal Management CZMJBF, Vol. 18, No. 2, p 179-193, 1990. 2 fig, 3 tab, 13 ref.

Descriptors: *Administrative decisions, *Alaska, *Coastal zone management, *Land development, *Permits, Administration, Coasts, Federal jurisdiction, Legislation, Surveys.

In 1984 the state of Alaska created a process that combined permit review with coastal district review of proposed state and federal projects as provided by the Alaska Coastal Management Act. The process, managed by the Division of Governmental Coordination, incorporates permit reform strategies such as joint reviews, preapplication consultation, time-limiting techniques, and a rapid appeals process. This study examined the success of the process through a survey of 74 people, including permit applicants, both private and public, and representatives of coastal districts and state permitting agencies. Responses support the conclusion that the process achieves its primary goals of coordinating permits, increasing communication among participants, and increasing participation of local communities, as well as other benefits such as saving applicants and agencies time and money. Although all groups suggested changes to the process, all groups felt strongly that the process should be retained. (Author's abstract)

FEDERAL-STATE TENSIONS IN AUSTRALIAN ENVIRONMENTAL MANAGEMENT: THE WORLD HERITAGE ISSUE.
Murdoch Univ. (Western Australia). Dept. of Political Science.
B. Davis.
Environmental and Planning Law Journal EPLJEX, Vol. 6, No. 2, p 66-78, June 1989. 24 ref.

Descriptors: *Australia, *Conservation, *Environmental protection, *Federal jurisdiction, *Resource management, *State jurisdiction, *World Heritage sites, Legal aspects, Political aspects.

Nowhere is the conflict of values inherent in conservation and resource development more glaringly obvious than in the political and legal battles which have often accompanied proposed World Heritage Listing. From the wilderness of South West Tasmania through tropical rainforests of North Queensland to the open spaces of Kakadu, the struggle between competing interests has mirrored the shifting values of Australian society as a whole. Australia has met its internal obligations and appears willing to fund World Heritage sites and the States have received substantial financial compensation. The Commonwealth has only acted after repeated attempts at negotiation and in instances where mismanagement of resources is clearly evident at State levels. The extent to which State and Territorial decisions can be permitted to infringe upon foreign policy clearly has limits. Some of the unilateral actions taken by the Tasmanian, Queensland and Northern Territory Governments in directly confronting World Heritage Committee members can only be regarded as damaging to Australia's reputation, particularly as the aim is frequently political point-scoring, rather than any deep concern about environmental issues. ENVIRONMENTAL IMPACTS OF DEVELOPMENT ON WETLANDS IN ARID AND SEMI-ARID LANDS.
University Coll., London (England). Dept. of Geography.
G. E. Hollis.
Hydrological Sciences Journal HSJODN, Vol. 35, No. 4, p 411-428, August 1990. 1 fig, 46 ref.

Descriptors: *Ecological effects, *Ecosystems, *Environmental impact, *Land development, *Water resources development, *Wetlands, Agriculture, Arid lands, Greece, New Zealand, Semi-arid lands, United States, Urbanization, Water resources management.

Wetlands, as defined by the Ramsar (Greece) Convention, are productive ecosystems providing goods and services for people. Negative effects from the 'development' of wetlands are exemplified through adverse climatic effects (Aral Sea, USSR), inadvertent environmental changes (Canadian Prairie Potholes), non-sustainable alternative uses (South Chad Irrigation Scheme, Nigeria), exacerbation of problems (Garaet El Haouaria, Tunisia), detrimental effects on rare species (Mikri Prespa, Greece), social disruption (Kissingin Fadama, Nigeria), international obligations (Ich-

keul, Tunisia), and sub-optimal management (Weija-Panbros, Ghana). The functions and values of wetlands are described in the 'Adamus approach,' and are exemplified even for the 'dry' areas of the Hadejia-Nguru wetlands (Nigeria) and Lake Hula (Israel). Wetlands are threatened by agricultural intensification, pollution, engineering schemes, and urban development. Since the societies and institutions that degrade wetlands are themselves complex systems, an understanding of hydrology and ecology is insufficient for a wetland manager. Wetland destruction can be aided by misconceptions, public subsidy, international funds, local-scale planning, sectoral approaches, and narrow disciplinary thinking. National Wetland strategies are needed, on the order of those presently developed in New Zealand and the United States. Hydrologists should be more involved in wetlands and their sustainable utilization. 'Political hydrology' must complement 'scientific hydrology.' (Author's abstract)

ORITIZING FLOW ALTERNATIVES FOR IAL OBJECTIVES.
rado State Univ., Fort Collins. Water Reces Research Inst.
lug, and J. Ahmed.
al of Water Resources Planning and Manage- (ASCE) JWRMD5, Vol. 116, No. 5, p 610- September/October 1990. 2 fig, 5 tab, 7 ref.

riptors: *Environmental policy, *Flow ls, *Multireservoir networks, *Social aspects, *Water resources management, Canada, Environmental control, Flow equations, Mathematical models, Minnesota, Numerical analysis, Priorities, Reservoir operation, Simulation analysis, Urban planning.

Most mathematical modeling efforts in water resources fall far short of adequately including social and environmental objectives. Although many modelers have good intentions at the start of their analyses, the objective functions and constraint sets do not provide a good mechanism for addressing these resource issues. Results from a three-reservoir network simulation model were numerically rated for impact upon 22 natural resource attributes associated with seven resource objectives. Priority weighting of individual resource objectives was included, as well as the ranking of importance for each attribute to its respective resource objective. This technique provides a quantitative and objective approach to evaluate flow regulation alternatives. Input from special interest groups, the general public, and concerned individuals, as well as professionals in each resource area, are a part of the overall analysis. The simple technique provides a screening tool to identify good and bad flow alternatives. These methods were successfully applied to a three-reservoir system at Voyageurs National Park on the Minnesota and Canadian border. (Author's abstract)

HYDROELECTRIC DAMS AND THE DECLINE OF CHINOOK SALMON IN THE COLUMBIA RIVER BASIN.
Marquette Univ., Milwaukee, WI. Dept. of Economics.
D. E. Booth.
Marine Resource Economics JMREDD, Vol. 6, No. 3, p 195-211, 1989. 8 tab, 29 ref.

Descriptors: *Chinook, *Columbia River, *Dam effects, *Ecological effects, *Hydroelectric plants, *Salmon, *Water resources management, Environmental impact, Fish harvest, Fish migration, Fish populations, Oregon, Regression analysis, Spawning, Washington, Watershed management.

Chinook salmon runs into the mouth of the Columbia River (Oregon and Washington)--runs that historically were among the largest in the world--have declined significantly since the mid-1920s. The decline is thought to be partly attributable to the construction of hydroelectric dams. The magnitude of losses in chinook salmon runs caused by hydroelectric dams has been estimated using regression analysis. Such estimates are not only of historical interest but also can potentially affect the extent of efforts to mitigate salmon losses from hydropower operations. Congress has mandated that the magnitude of run losses caused by hydroelectric operations be considered in determining the extent of mitigation efforts. The total annual loss of chinook salmon resulting from both mainstem and tributary dams is estimated to be somewhere between 3,543,890 and 4,891,897 fish. In-river runs have recently been less than the weighted and lagged spawner escapement levels for both the spring and summer runs, suggesting that the continued existence of these runs is clearly threatened. The regression equations can be used to calculate the optimum level of spawner escapement and the maximum run level that results given the existence of dams. Unless the ocean harvesting of summer chinook is reduced or extensive mitigation efforts are undertaken, the summer run appears to be doomed. The question is as much ethical as it is economic, given that the destruction of the wild spring and summer runs would be essentially equivalent to the destruction of species. (Fish-PTT)

COMPARATIVE ANALYSIS OF STATE ENVIRONMENTAL POLICY.
Colorado State Univ., Fort Collins. Dept. of Political Science.
J. P. Lester, and E. N. Lombard.
Natural Resources Journal NRJOAB, Vol. 30, No. 2, p 301-319, 1990. 1 fig, 4 tab, 39 ref.

Descriptors: *Environmental policy, *Environmental protection, *Governmental interrelations, *Policy making, *State jurisdiction, Administrative agencies, Administrative decisions, Comparison studies, Data interpretation, Model studies, Political aspects.

Since the enactment of the National Environmental Policy Act (NEPA) of 1969, comparative state environmental policy studies have ranged from case studies to systematic input-output analyses. Conditions that promote or inhibit state environmental management have not been clearly identified due to research problems such as lack of theory, a reliance upon cross-sectional (versus longitudinal) analysis, limited measures of environmental effort, and inadequate analytical techniques. Sources of data on state commitment to environmental protection include Department of Commerce, The Council of State Governments, The Conservation Foundation, and the Fund for Renewable Energy and the Environment. Comparative state politics and policy research has been criticized as being atheoretical, endogenic, time-bound and methodologically unsound. An intergovernmental model is presented for future state environmental politics research which conceptualizes the implementation process at the state level. This model adopts a conceptual framework that represents the intergovernmental nature of policy implementation in the 1980s (and presumably in the 1990s). Such a framework would respond to the criticisms that previous research in this area has been too concerned with bivariate relationships (in the absence of a genuine theory) or has adopted a 'mainstream model', which was endogenic (at best) or inaccurate (at worst) by assuming that only state-level variables influenced state policy outputs. Obstacles to the further theoretical advance of the state environmental politics and policy literature can be overcome by: (1) collecting data and analyzing relationships in a diachronic (longitudinal) fashion; (2) measuring state environmental policy with both expenditure and non-expenditure data and testing their relationships with predictor variables separately; (3) using path-analytic techniques whenever possible; and (4) combining quantitative (fifty-state) with qualitative (case studies of individual states) analyses. ESTIMATION OF RECRUITMENT FORGONE RESULTING FROM LARVAL FISH ENTRAINMENT.
Michigan Univ., Ann Arbor. School of Natural Resources.
A. L. Jensen.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 241-244, 1990. 1 tab, 1 fig, 12 ref.

Descriptors: *Electric powerplants, *Entrainment, *Fish populations, *Lake Erie, *Model studies, *Perch, Fish eggs, Larvae, Mathematical analysis.

A method for estimation of recruitment forgone, or lost, as a result of larvae and egg entrainment was developed; it requires parameter estimates only for recruited members of the population, which are more easily estimated than those for younger life stages. It requires no estimates for abundance. The method was applied to assess yellow perch larvae entrainment at the Monroe Power Plant, Monroe, Michigan, located on the

LIBRARY U. OF I. URBANA-CHAMPAIGN

western basin of Lake Erie. The number of yellow perch larvae entrained was 128 million, which is an enormous number, but larvae mortality is high and the recruitment forgone was 8933 fish. (Author's abstract)

The free-flowing nature of streams in the U. S. has been dramatically altered over the past century, especially through construction of dams. The Nationwide Rivers Inventory (NRI) estimated a total of 5,2000,000 km of streams in the contiguous 48 states, but only 2% (<100,000 km) have sufficient high quality features to be worthy of federal protection status. The future of this dwindling number of high-quality streams is in doubt as proponents if development compete with conservation interests. Hydropower projects are projected to be built well into the future with a large increase in small projects (55% more than in 1988) even though the total generating capacity of the U. S. would increase only 0.3%. On the other hand, conservation efforts have resulted in increasing levels of federal protection of streams since the 1960s. National River or Wild and Scenic River status now provides protection for almost 16,000 km of streams, but only about 10% are found east of the Mississippi River. Analysis of the NRI database showed that the greatest quantity and density of high-quality streams are found in the south-Atlantic states, where streams have the least protection. The greatest number of NRI streams are found in the Coastal Plain and Central Lowland physiographic provinces. The NRI analysis showed only 42 high-quality, free-flowing (no major dams) rivers > 200 km remaining in the 48 contiguous states. With continuing threats of exploitation, major conservation efforts are required to preserve these last free-flowing streams. (Author's abstract)

EVALUATION OF DESIGNS OF PERIODIC COUNT SURVEYS FOR THE ESTIMATION OF ESCAPEMENT AT A FISHWAY.
Department of Fisheries and Oceans, Halifax (Nova Scotia). Biological Sciences Branch.
B. M. Jessop, and C. J. Harvie.
North American Journal of Fisheries Management NAJMDP, Vol. 10, No. 1, p 39-45, Winter 1990. 3 fig, 2 tab, 13 ref.

Descriptors: *Fish migration, *Nova Scotia, *Sampling, Alewife, Fish passages, Fish populations, Quality control, Statistical analysis.

Counts of the number of alewives Alosa pseudoharengus migrating through the fishway on the Gaspereau River, Nova Scotia, were used to evaluate the accuracy and precision of various sampling schemes for estimating the population mean (true mean count/sample unit (15 min)). High variability in counts within day and season required more intensive sampling than suggested by previous studies to estimate the population mean to within a given percent relative error. Stratification in some cases doubled or trebled the precision of the estimated mean relative to the mean obtained from simple random sampling, whereas systematic sampling produced no gain in precision. Stratification to reduce the number of sample units required for a given precision may reduce the power of a test to detect differences between annual estimates of population means, depending on their variances. The importance of these interrelated factors should be determined before a particular scheme and level of effort are chosen for sampling. (Author's abstract)

Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4123, 1990. 104p, 9 fig, 12 tab, 76 ref.

Descriptors: *California, *Hydrologic data, *Network design, *Salinas River, *Water resources data, Groundwater, Groundwater level, Groundwater management, Groundwater quality, Land use, Monterey County, Precipitation, Precipitation quality, Surface water, Surface water quality, Surface water records.

This report evaluates existing data collection networks and possible additional data collection to monitor quantity and quality of precipitation, surface water, and groundwater in the northern Salinas River drainage basin, California. Of the 34 precipitation stations identified, 20 were active and are concentrated in the northwestern part of the study area. No precipitation quality networks were identified, but possible data collection efforts include monitoring for acid rain and pesticides. Six of ten stream-gaging stations are active. Two surface water quality sites are sampled for suspended sediment, specific conductance, and chloride; one U.S. Geological Survey NASOAN site and one site operated by California Department of Water Resources make up the four active sampling locations; reactivation of 45 inactive surface water quality sites might help to achieve objectives described in the report. Three local networks measure water levels in 318 wells monthly, during peak irrigation, and at the end of the irrigation season. Water quality conditions are monitored in 379 wells; samples are collected in summer to monitor saltwater intrusion near Castroville and are also collected annually throughout the study area for analysis of chloride, specific conductance, and nitrate. An ideal baseline network would be an evenly spaced grid of index wells with a density of one per section. When baseline conditions are established, representative wells within the network could be monitored periodically according to specific data needs. (USGS)

Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 549-561, May 1990. 10 fig, 2 tab, 29 ref. NSF Grant No. DPP 87-12533 and DOE Contract No. DE-AC03-76-SF01012.

Descriptors: *Dosimetry, *Instrumentation, *Measuring instruments, *Radiometry, *Ultraviolet radiation, Antarctica, Biological dosimeter, DNA.

A biological dosimeter has been developed for use in aquatic environments. This method is based on the sensitivity of a DNA repair-deficient strain of Escherichia coli (CSR06) to ultraviolet (UV) radiation. The dosimeter permits evaluation of the penetration of biologically active UV radiation within a water column, reflecting the potential effect of exposure over selected time intervals. With the use of various filters, the biological dosimeter can discriminate between the effects of UV-B (280-320 nm) and UV-A (320-400 nm) or other selected portions of the solar UV spectrum. During springtime ozone depletion over the Antarctic in 1988, a general relationship was observed between stratospheric ozone concentration and the contribution of incident solar UV-B radiation to lethality of dosimeter cells. The use of dosimeters within the water column indicated that significant amounts of UV-B can be transmitted to a depth of 10 m and biological effects of UV could be detected to 20 and 30 m. Biological dosimeters may provide a means of standardizing in-water UV measurements across all types of aquatic habitats and at any geographical location. (Author's abstract)

SIMPLE PORE-WATER SAMPLER FOR COARSE, SANDY SEDIMENTS OF LOW POROSITY.
Nederlands Inst. voor Onderzoek der Zee, Texel.
P. M. Saager, J. P. Sweerts, and H. J. Ellermeijer.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 747-751, May 1990. 3 fig, 2 tab, 9 ref.

Descriptors: *Centrifugation, *Interstitial water, *Pore-water samplers, *Samplers, *Water sampling.

A simple, inexpensive, and highly efficient centrifuge tube allows nearly complete extraction of interstitial water from coarse, sandy sediments with porosities as low as 32%. The method is fast (5 min), efficient (55-92% of the available water is obtained), reliable, and can be performed on board ship at only 1,500 x g. The efficiency of the method permits a high sampling resolution (millimeter scale). The centrifuge tube is made of polyethylene and can be used for trace metal determinations after cleaning with acid. Due to a built-in filter, pore waters are clean and need not be filtered afterward, thus reducing the risk of contamination and possible oxidation artifacts. (Author's abstract)

The task of groundwater resources protection represents one of the most difficult tasks of the hydrologist. Geophysical well logging has played an important role in completing geohydrological tasks particularly where boreholes are concerned. A new quantitative method for the evaluation of fluid resistivity logs has been developed which provides information on partial yields of individual inflows. In the wells which penetrate zones of high mineralized waters near their bottoms, it is possible to delineate individual inflows and to determine partial yields of each water producing horizon using only one fluid resistivity log recorded during or after the pumping test. Together with the formation resistivity log it is also possible to distinguish zones yielding fresh and mineral waters. Estimating the run-in characteristics of aquifers during a constant water injection into the well, it is possible to determine the thickness and the hydraulic conductivity of aquifers prepared for artificial recharge. Descriptors: *Aerosols, *Atmospheric water, *Data acquisition, *Instrumentation, *Measuring instruments, *Meteorological data, *Remote sensing, *Satellite technology, *Spectral analysis, *Water vapor, Climatic data, Marine climates, Microwaves, Optical properties, Reflectance, Solar radiation.

A new technique is proposed to estimate atmospheric total water vapor amounts from space. The technique consists of viewing the Earth's surface in two spectral channels, one narrow, the other wide, centered on the same wavelength at the water vapor absorption maximum near 940 nm. With these characteristics, the ratio of the solar radiance measured in the two channels is independent of the surface reflectance, and yields a direct estimate of the water vapor amount integrated along the optical path. To test the technique, a two-channel radiometer was designed and built based on the above concept. Airborne experiments carried out with the new device demonstrate the technique's feasibility under clear sky conditions over both sea and land. Over the ocean and in the presence of thick aerosol layers, however, total water vapor amounts may be underestimated by as much as 20%. Compared to satellite microwave techniques, which are applicable under most weather conditions, the proposed technique has the advantage of simplicity and constitutes a promising alternative over land, where microwave radiometry is inappropriate. Passive microwave sounding of terrestrial atmospheric temperature profiles was first suggested in 1963. Imaging of O2 emissions using the 118.75-GHz (1-) resonance has been investigated for tropospheric and stratospheric remote sensing of atmospheric temperature and precipitation. An imaging millimeter-wave spectrometer (MTS) was constructed. The MTS collected data during 33 flights of a high-altitude aircraft in 1986, yielding the first high spatial resolution microwave images of atmospheric O2 brightness. The isolated 118-GHz line offers higher spatial resolution and precipitation sensitivity than O2 lines in the 5-mm band near 60 GHz. The brightness temperature perturbations of clouds in nonprecipitating regions are typically twice as large in the 118-GHz channels relative to comparable 60-GHz channels. However, observations over cirrus anvils show that the 118-GHz brightnesses are not adversely sensitive to some optically opaque cloud cover. Thus, these channels are expected to be useful for temperature sounding in the presence of clouds, although retrieval ambiguities can result from variations in the water vapor profile and surface emissivity. Over deep convective precipitation, 118-GHz brightness temperature images are characterized by decreases of up to 200 K due to strong scattering in the storm core. The amplitudes and shape of the 118-GHz spectrum contain information on the cell top by virtue of the various peaking altitudes of the 118-GHz weighting functions. Precipitation cells observed by the MTS sometimes appear in bands or rows, and have been accompanied by periodic radiance structures. (Author's abstract)

In order to track water resource information and how it relates to independent consumer interests in the irrigable land in the Mid-Pacific Region of the US, the Bureau of Reclamation (Department of the Interior) uses geographic information system (GIS)

LIBRARY U. OF I. URBANA-CHAMPAIGN

technology--a computerized mapping/database management system that allows users to capture, edit, display, and analyze geographic data. The database allows them to combine information from various sources into a single map displaying areas of concern. The Computer Assisted Cartographic (CAC) document was created to outline functional requirements and allow a more appropriate automation tool. A system was needed that could take data from a variety of different sources, analyze it, and store it in individual layers. When the system requirements were completed, the CAC included such particulars as scale and projection transformations, topological overlays, addition of new layers to existing drawings and the ability to create new layers from existing layers. The Bureau purchased a general-purpose data management package that allows users to bring survey information into the database from many sources. It consists of the ARC system, which stores cartographic data, and the INFO relational database, which stores attribute data. In its efforts to automate the everyday analysis and mapping tasks, the Bureau has expanded its role in water resource management to better provide the districts it serves with accurate and fair water contracts. Their efforts are contributing to the resolution of litigation and water disputes in the arid and semiarid western land. (Fish-PTT)

Descriptors: *Computer models, *Computer programs, *Data acquisition, *Supervisory control, *Wastewater management, *Water management, Cost-benefit analysis, Monitoring, SCADA system, Wastewater facilities.

Over the past five years, supervisory control and data acquisition (SCADA) has evolved from a fledgling tool for the water industry to a reliable, sophisticated means of monitoring, reporting, and controlling the operation of modern water/wastewater plants. A successful installation will reduce manpower requirements by 50% or more, ease future expansion and effortlessly keep pace with the ever-increasing paperwork requirements of regulatory agencies. The benefits of SCADA are not restricted to large plants. SCADA becomes an asset when the costs of installing the system are surpassed by the benefits achieved from the system. System architecture is critical to a successful SCADA system. Over-design and under-design are dangers paid for by high cost, complex maintenance, increased variables, and undertrained operators. Personal computer-platform SCADA systems perform best (most quickly and dependably) when user programs are solved outside of the personal computer. If the system requires only monitoring and direct output of operator commands to the field, remote terminal units can be used. Manual and semi-automatic backups must be designed into the system to maintain all critical processes in the event of malfunction. Today's technology has brought simple SCADA control, financially, within the reach of almost every district. A basic SCADA system can be purchased for less than $30,000. (Fish-PTT)

M. D. Fornwall, and A. Hough.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 379-382, June 1990. 1 fig, 10 ref. NSF Grant DEB81-D3528.

Descriptors: *Benthic flora, *Biological samples, *Bottom sampling, *Samplers, *Submerged aquatic plants, Aquatic soils, Cores, Ecosystems, Macrophytes, Sediments.

A coring device for quantitative sampling of benthic submerged macrophyte beds was constructed. The device has a relatively large-diameter barrel to include both above and below ground biomass, a long (variable length) handle for direct control, and a simple sample retaining mechanism to maximize ease of operation and to minimize cost. The sampler is effective in sediments ranging from organic muds to sandy clays, and in water depths of up to four meters. The 30-cm barrel consistently reaches below the maximum depth of plant roots in the sediment. This sampler cuts and retains dense macrophyte growth quite well. Tall shoots are difficult to sample however, requiring careful, vertical lowering of the sampler, and thus the sampler is not well suited for beds of tall plants. The large root systems of the Nymphaceae challenge the sampler also, but at their relatively shallow depths it is possible to achieve the cutting necessary to produce acceptable samples. These types of problems require the direct control provided by the pole-type handle. A short-handled version of this sampler could be adapted for diver use. (Agostine-PTT)

MEASUREMENT AND INTERPRETATION OF LOW LEVELS OF DISSOLVED OXYGEN IN GROUND WATER.
Geological Survey, Menlo Park, CA.
A. F. White, M. L. Peterson, and R. D. Solbau.
Ground Water GRWAAP, Vol. 28, No. 4, p 584-590, July/August 1990. 6 fig, 1 tab, 22 ref.

Descriptors: *Analytical methods, *Dissolved oxygen, *Groundwater pollution, *Metals, *Path of pollutants, *Radionuclides, *Selenium, Agricultural runoff, Analytical techniques, Aquifers, California, Kesterson Reservoir, Monitoring.

A Rhodazine-D colorimetric technique was adapted to measure low-level dissolved oxygen concentrations in groundwater. Prepared samples containing between 0 and 8.0 micromoles/l dissolved oxygen in equilibrium with known gas mixtures produced linear spectrophotometric absorbance with a lower detection limit of 0.2 micromoles/l. Excellent reproducibility was found for solutions ranging in composition from deionized water to sea water with chemical interferences detected only for easily reduced metal species such as ferric ion, cupric ion and hexavalent chromium. Such effects were correctable based on parallel reaction stoichiometries relative to oxygen. The technique, coupled with a downhole wire line tool, permitted low-level monitoring of dissolved oxygen in wells at the selenium-contaminated Kesterson Reservoir in California. Results indicated a close association between low but measurable dissolved oxygen concentrations and mobility of oxidized forms of selenium in the shallow aquifer which were in general electrochemical disequilibrium. (Author's abstract)

PRIMER ON CLOTHING SYSTEMS FOR COLD-WEATHER FIELD WORK.
Geological Survey, Bow, NH. Water Resources Div.
J. C. Denner.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 89-415, April 1990. 14p, 2 fig, 4 tab, 9 ref.

Descriptors: *Acclimatization, *Clothing, *Cold regions, *Data acquisition, *Hydrologic data, *Hypothermia, *Thermal stress, High-loft insulators, Layering system, Moisture absorption, Thermal conductance, Thin insulators.

Hypothermia in cold environments can be prevented by physiological adaptation and by the proper use of cold weather clothing. The human body adjusts to cold temperature by increasing the rates

' basal metabolism, specific dynamic action, and
ıysical exercise. Heat loss is reduced by vasocon-
riction. Clothing systems for cold weather reduce
ss by providing insulation and protection from
e elements. Satisfactory cold-weather clothing is
ınstructed of wool fabrics or the synthetic fibers
olypropylene and polyester. Outerwear suitable
r cold climates is insulated with down, high-loft
olyester fiberfills, or the new synthetic thin insu-
ors. (USGS)

urrent measuring device, the Shot-Sensor, was
eloped as a low cost alternative to measuring
er flow speeds and directions using convention-
more expensive instrumentation. The device
ases stainless steel shot, of know size and set-
speed, into a flowing water mass. As the shot
es, it is dispersed by currents and ends up in
ng traps. Mean current speed and direction
be calculated from the patterns of dispersal and
ercentages of shot of various sizes in the traps.
n current speed and direction can be calculat-
om the patterns of dispersal and the percent-
of shot of various sizes in the traps. Determi-
n of precision and accuracy indicate that the
-Sensor can measure within a few cm/sec of
expensive meters and may be suitable for
shallow-water applications. Speed range of
Shot-Sensor is presently limited to between 3
40 cm/sec, but further development could
this range to be extended. (Author's abstract)

IMPROVEMENTS TO SURCHARGE CALCULATIONS IN EXTRAN.
Brown and Caldwell, Seattle, WA.
L. K. Belvin.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 33-42, 6 fig, 4 ref.

Descriptors: *Flow profiles, *Storm Water Management Model, *Storm water management, *Unsteady flow, *Urban hydrology, *Urban runoff, Data interpretation, Flood peak, Fluid dynamics, Mathematical studies, Pipe flow, Storm runoff.

Unsteady non-uniform surcharged flow is a condition frequently found in combined sewer systems. Yet, to date there is no well documented, publicly available sewer model which can accurately simulate such flows. The Extended Transport (EXTRAN) block of the EPA's Stormwater Management Model (SWMM) was designed to model such flows, but it has deficiencies. Continuity is not necessarily preserved in the model, especially under surcharge conditions, which causes errors in flow balance, peak flow time and peak heads. In this paper, modifications have been made to the model to improve the non-uniform surcharge flow calculations. By accounting for fluid volumes in the pipes, the calculations of continuity are improved, especially under surcharge. These modifications were incorporated into the existing model without changing the input or output parameters. The improved model does not require additional user training to operate the model. The result is a publicly available, well-documented hydraulic sewer model that more accurately models unsteady, non-uniform surcharge flows. As demonstrated in a sample application, the modified EXTRAN code preserves continuity and matches computed head values better than the original EXTRAN code. Because the improvements were made without changing the user parameters of the model, this new version of EXTRAN, in conjunction with the available EXTRAN documentation, is the only publically available, well-documented program that accurately models surcharge flow under non-uniform, unsteady conditions. CUHPCAD is a computer program developed for the promotion of hydrological data automation, which serves as a control program to link between AutoCAD and the CUHP program. The program was developed for the purpose of hydrologic data automation, and consists of two parts: (1) the CUHP.LSP program which analyzes and stores the data generated by using AutoCAD; and (2) the CUHPCAD.BAS program which can abstract the data from CUHP.LSP and perform data calculation and preparation of CUHP data input files. The CUHPCAD program has been tested and applied to a major drainage basin planning project for the study of Second, Third, and Box Elder Creeks in Adams County, CO. The study area is approximately 70 sq mi. Total sub-basin number is 390. Soil types include A, B, and C groups based on Soil Conservation Service's soil survey report. Land use for existing conditions are mostly agricultural. Three baseline hydrological conditions for the frequencies of 20, 5-, 10-, and 100-year need to be modeled by using CUHP which includes existing basin conditions, and future basin conditions with or without the proposed New Denver Airport. With the use of CUHPCAD, The hydrology portion of this project was completed within the allowable schedule and budget. After the manual preparation of the basin map, soil map, and the land use map, the input of all maps to the computer was completed. (Lantz-PTT)

LIBRARY U. OF I. URBANA-CHAMPAIGN

A cascade-of-reservoirs rainfall-runoff model, called MAPHYD, has been developed which incorporates automatic generation of model input data using geographical information system functions integrated into a user friendly workstation. Digital terrain modeling is conducted to obtain slope and the direction of slope for a user-selectable grid cell resolution. Associated data on soils and infiltration characteristics, land use and percent impervious, antecedent moisture conditions, and rainfall distribution are simulation routines. Output result of the spatial distribution of runoff at each time step are displayed using an interval color scale. Input, retrieval, and editing of the digital database is accomplished by interactive computer graphics techniques. (See also W91-01188) (Author's abstract)

E. W. Strecker, E. D. Driscoll, and G. E. Palhegyi.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 161-172, 3 fig, 7 tab, 9 ref.

Descriptors: *Computer programs, *Data processing, *Microcomputers, *Rainfall-runoff relationships, *Storm runoff, *Synoptic Rainfall Analysis Program, *Urban hydrology, *Urban runoff, Computers, Runoff, Statistical analysis.

EPA's Synoptic Rainfall Analysis Program (SYNOP) for the personal computer analyzes an hourly rainfall record, that can be obtained on floppy disk from the National Climatic Data Center, for rain gages located throughout the country. It generates a variety of storm event based summary statistics. By specifying a minimum dry period that separates successive storms, SYNOP groups the hourly rainfall record into storm events and analyzes the resulting record. A user friendly interface has been provided for the selection of computational and printout options. Some of the added features include the ability to: (1) select either a water year or calendar year organization, (2) to conduct an analysis on a seasonal basis (useful for dealing with the pronounced wet and dry seasons in some areas of the country), (3) to exclude from the statistical analyses all storm event volumes that are less than some user specified minimum (used to determine the characteristics of only those storm events that will produce runoff), and (4) the ability to write out a separate file containing storm event information on all storm events in the record for downloading to a spreadsheet or statistical analysis program. A cooperative analysis is presented in tabular form that examines the effects and some of the implications of a minimum storm event that generates runoff. (See also W91-01188) (Lantz-PTT)

COMPUTER AIDED PLANNING OF DRAINAGEWAY IMPROVEMENTS MADE EASY WITH LOTUS 1-2-3.
Greenhorne and O'Mara, Inc., Aurora, CO.
M. B. Cooke, and R. P. Gildersleeve.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 173-182, 3 ref.

Descriptors: *Computer programs, *Computer-aided design, *Drainage systems, *Storm water management, *Urban hydrology, *Urban runoff, Channels, Culverts, Data processing, Hydraulic properties, Pipes, Storm runoff, Stormwater Master Plan Model.

A computer program was developed which combines an hydraulics package with a cost-estimating program to allow quick planning level comparisons of alternative planning scenarios. The Stormwater Master Plan Model (SMPM) is a menu-driven program for those involved in the master planning of drainageways. The program computes hydraulic characteristics of existing and planned drainageway improvements and estimates their cost. SMPM models four types of drainageway elements: channels, culverts bridges and detention ponds. Channels can be grasslined, riprap or concrete and can include concrete or riprap drop structures. The program accommodates four types of culverts: corrugated metal pipe, corrugated metal arch, concrete pipe and reinforced concrete box culverts. One of the most powerful features of SMPM is its cost routine. The program computes a planning level cost estimate for each drainageway element included in the model. The cost is based on user defined unit costs for excavation, riprap, pipe right of way and other common capital cost items. Modifications to design flows and any drainageway element can be made quickly and easily via the menu. SMPM is designed for those that are familiar with running LOTUS 1,2,3 Release 2. Each model can contain up to 35 channel, culvert or bridge elements. (See also W91-01188) (Lantz-PTT)
W91-01205

HYETOGRAPH COMPOSITING EFFECTS ON URBAN RUNOFF MODELLING.
Kiowa Engineering Corp., Denver, CO.
M. P. Jansekok, and B. R. Urbonas.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 183-195, 15 fig, 1 tab, 1 ref.

Descriptors: *Data processing, *Hyetographs, *Model studies, *Rainfall-runoff relationships, *Urban hydrology, *Urban runoff, Case studies, Colorado, Computer models, Denver, Flood peak, Runoff, Storm runoff.

Rainfall and runoff data from a 3.08 sq mi urban watershed in Denver, Colorado was used to investigate the effects of compositing several recorded rainstorm hyetographs on urban stormwater runoff modelling results. The watershed in this semi-arid region had data at five rain gages and two flow gages, which provided the basis for calibrating an Urban Drainage and Flood Control District version of the Storm Water Management Model (SWMM). The calibrated model was then used to examine the effects of runoff calculations using a single composite hyetograph for each storm. Compositing of hyetographs was performed using two types of area weighted techniques. The five hyetographs were then composited directly using the recorded rainfall depth at each clock time interval. In addition, the hyetographs were composited using a technique that first shifted the five gage records so the peak rainfall time increments of each hyetograph were aligned. In this study very little difference was found in peak flow and runoff volume simulations between the two types of hyetographs compositing techniques, namely compositing straight across or compositing using peak preservation. However, the author's believe that it is premature to accept this finding as a general finding applicable under all conditions. Both methods tended to underestimate peak flows and volumes when compared against the calibrated multi-rain gage hyetograph runs using a calibrated SWMM model. (See also W91-01188) (Lantz-PTT)
W91-01206

FLOOD HYDROGRAPH FOR UNGAGED WATERSHED.
Stewart Environmental Consultants, Inc., Fort Collins, CO.
W. C. Cunha.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 196-207, 3 fig, 1 tab, 8 ref.

Descriptors: *Data interpretation, *Flood hydrographs, *Model studies, *Rainfall-runoff relationships, *Storm runoff, *Urban hydrology, *Urban runoff, Computer models, Flood routing, Hydrographs, Infiltration.

The flood hydrograph for ungaged watershed can be calculated utilizing the Soil Conservation Service (SCS) data and physically-based soil infiltration equations, and the XSRAIN model. This software utilizes physically-based infiltration equations to calculate the abstraction of rainfall in basins for which there is a minimum of available hydrologic information. The hydraulic soil parameters can be easily calculated from a relationships between the SCS's curve number (CN) and the mentioned parameters. Large heterogeneous watersheds can be partitioned into several smaller homogeneous sub-basins. Routing of excess rainfall is performed with the SCS dimensionless unit hydrograph to produce a runoff hydrograph for each individual sub-basin. The final flood hydrograph is obtained by routing and summing the runoff hydrographs of sub-basins according to the travel time associated with them. Rain data can be supplied by simply providing the depth and duration of rain or the user may input variable rain depths. (See also W91-01188) (Lantz-PTT)

UNIT-HYDROGRAPH PROCEDURES FOR ARID LANDS.
G. V. Sabol, J. M. Rumann, D. Khalili, and T. A. Dominguez.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 208-216, 2 tab, 6 ref.

Descriptors: *Arid lands, *Arizona, *Data interpretation, *Flood control, *Rainfall-runoff relationships, *Unit hydrographs, Graphical analysis, Hydrographs, Mathematical studies, Storm runoff.

Unit hydrographs are used in most hydrometeorological flood analyses in the arid west and throughout the U.S. Recently, two studies were conducted for the Flood Control District of Maricopa County, Arizona, for the purpose of selecting or developing synthetic unit hydrograph procedures for use in the County. A study was conducted to compile S-graphs from the southwest, and to select S-graphs for use in the various physiographic landforms within Maricopa County. A second study was conducted to collect rainfall-runoff data from the southwest and to analyze this data to develop a synthetic hydrograph procedure for Maricopa County. Rainfall-runoff data was compiled from the Walnut Gulch Experimental Watershed at Tombstone, Arizona, Tucson Experimental Watersheds, urban hydrology programs of the USGS in Denver and Albuquerque, and a USGS data collection program in Wyoming. The procedure to synthesize the Clark unit hydrograph was: (1) Estimate the time of concentration (TC); (2) estimate the storage coefficient (R); and (3) develop the appropriate time-area relation which would be expected to fall within appropriate envelopes to select the default time-area relations. DROGEOLOGIC DATABASE FOR OUND-WATER MODELING.
undwater Services, Inc., Houston, TX.
. Newell, L. P. Hopkins, and P. B. Bedient.
ound Water GRWAAP, Vol. 28, No. 5, p 703-, September/October 1990. 9 ref, 7 tab, 17 ref, end.

scriptors: *Computer programs, *Databases, eohydrology, *Groundwater movement, *Hydlogic data collections, *Model studies, ifers, Classification, Computers, Flow velociGroundwater data, Hydraulic conductivity, draulic gradient, Land disposal, Monte Carlo hod, Saturated flow, Seepage.

ew geohydrologic database, the HGDB, was eloped from a national survey of National Water Well Association (NWWA) members. The database contains general geohydrologic information from 400 field site investigations across the country, and detailed statistical summaries of five groundwater parameters: hydraulic conductivity, seepage velocity, hydraulic gradient, saturated thickness, depth to top of aquifer. The HGDB was developed to verify and expand statistical distributions used in a Monte Carlo groundwater model developed by EPA for land disposal regulation. The database structure is a unique application of the aquifer classification method used in the NWWA's DRASTIC system. Respondents were asked to classify their aquifers as one of 111 different DRASTIC geohydrologic settings, and 12 groupings of settings were analyzed to produce statistical distributions of geohydrologic data based on site geology and geomorphology. Three examples of geohydrologic groupings are: coastal beaches; alluvial basins, valleys and fans; and outwash settings. The HGDB can be used for several purposes. First, the HGDB results indicate that the EPA's distributions of seepage velocity and hydraulic conductivity used in the land disposal model are sound. These are the most important geohydrologic parameters in the model. The HGDB goes a step further and provides a set of statistical distributions that can be used to make the land disposal regulations more site-specific than the national approach now being used. Finally, the HGDB data can be used for general site characterization and for educational purposes. The database is available as a detailed written report and spreadsheet file from the American Petroleum Institute, and is contained in a graphical computerized decision support system for groundwater modeling called OASIS. The HGDB serves as a framework for organizing geohydrologic information from different site investigations and can be expanded easily beyond the 400 sites now in the database. (Author's abstract)

PROGRAM TO CALCULATE HYDRAULIC CONDUCTIVITY USING SLUG TEST DATA.
Idaho National Engineering Lab., Idaho Falls.
A. Wylie, and T. R. Wood.
Ground Water GRWAAP, Vol. 28, No. 5, p 783-786, September/October 1990. 4 fig, 1 tab, 7 ref.

Descriptors: *Aquifer testing, *Hydraulic conductivity, *Pumping tests, *Slug tests, *Well testing, Computer programs, Data interpretation.

SLUGTST is a computer program which calculates hydraulic conductivity from data obtained during a slug test. An on-screen graphical display allows the user to view the data and make a rapid evaluation. During the execution of a slug test, the water level in a well is instantaneously raised or lowered and changes in the water level are monitored as it seeks an equilibrium position. SLUGTST a program written in TURBO BASIC for IBM-PC computers and compatibles, calculates hydraulic conductivity from data obtained during these tests. (Lantz-PTT)

ALGORITHM FOR RETRIEVING WATER VAPOR PROFILES IN CLEAR AND CLOUDY ATMOSPHERES FROM 183 GHZ RADIOMETRIC MEASUREMENTS: SIMULATION STUDIES.
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.
T. T. Wilheit.
Journal of Applied Meteorology JAMOAX, Vol. 29, No. 6, p 508-515, 1990. 6 fig, 1 tab, 11 ref.

Descriptors: *Algorithms, *Atmospheric water, *Data interpretation, *Radiometry, *Remote sensing, *Simulation analysis, *Water vapor, Atmospheric circulation, Cloud physics, Clouds, Marine climates, Microwaves.

The latent heat represented by atmospheric water vapor is extremely important to the energetics of the Earth system. Future satellites (NOAA and DMSP) will carry microwave radiometers designed to measure the profile of water vapor globally. The problem of retrieving water vapor from the measurements is highly nonlinear even in clear atmospheres, and the addition of clouds only makes it more so. An algorithm has been developed which will retrieve water vapor profiles from microwave radiometric measurements even in the presence of clouds. Simulations with this algorithm show a vertical resolution on the order of 3 km; clouds are well handled in many circumstances. At low altitudes the performance is decidedly better over the ocean than over land backgrounds; above 5 km the background makes little difference. The most surprising result is that clouds can actually improve the vertical resolution of the retrieval. (Author's abstract)

Descriptors: *Agricultural hydrology, *Clays, *Data interpretation, *Fertilizers, *Leaching, *Loam, *Model studies, *Soil water, *Solute transport, Agriculture, Arable soils, Calibrations, Fertilization, Model testing, Nitrogen, Permeability, Scotland, Soil science, Soil texture.

Conditions for arable farming in the southeast of Scotland are very variable because of the wide range of elevation, mean annual temperature, and annual effective precipitation. However, the rate of mineralization of nitrogen (N) during winter is low, and rather low carry-over of mineral N to spring occurs. Early application is vulnerable to leaching; thus the prediction of leaching of early spring fertilizer N is important so that later applications can be adjusted. A capacity-type approximate leaching model with a simple treatment of soil matrix permeability was tested, using field tracer experiments with CaBr2, on hydrologically isolated plots. The model predictions are sensitive to the value of the soil matrix permeability factor, and four methods of estimating this parameter were evaluated: (1) using a calibration based on soil texture; (2) least-squares fitting of the model to successive neutron probe measurements of the water content profile; (3) least-squares fitting to daily drainage outflow; and (4) least-squares fitting to cumulative drainage outflow. The best independent method (method 3) led to a slight (20-30%) under-prediction of leaching losses for two of the four experiments, but in one experiment leaching was much less than predicted. As a management model the approach seems promising but more attention needs to be paid to estimation of the value and variability of the permeability parameter. The convective-dispersion equation, using steady-state assumptions and a fitted dispersion length, gave as good a prediction of cumulative leaching losses as the approximate model. (Fish-PTT)

Descriptors: *Aquatic environment, *Secondary productivity, *Statistical analysis, *Statistical methods, *Statistics, Aquatic life, Benthos, Calculation methods, Cohort production interval, Ecosystems, Mathematical studies, Population dynamics, Precision.

The hypothesis that different secondary production estimation methods yield unbiased and equally precise estimates was tested using published data from 66 benthic invertebrate populations from lentic habitats. Tests are performed by Kruskal-Wallis one-way analysis of the residuals of a published empirical equation accounting for the important covariables biomass, body-mass, and water temperature. The data set analyzed came from 22 different ecosystems spanning a range of production from 0.03 to 66.40 g dry mass.sq m/yr, a range of mean annual biomass from 0.002 to 10 g dry mass/sq m, a range of body size from 0.01 milligrams to 60 mg dry mass and were found in environments with average annual surface water temperatures ranging from 4 to 18 deg. Of these estimates, 20 were made with the size-frequency technique, 26 were made with the Allen curve or growth increment summation methods, and 20 were made with the instantaneous growth technique. While no method was found to be significantly biased, the size-frequency method was less precise than the Allen curve, growth increment summation or instantaneous growth methods, yielding estimates about three times farther from the probable production values than other methods. Imprecision of inferred cohort production interval (CPI) is suggested as one source of error. (Author's abstract)

WATER RESOURCES DATA FOR NEW MEXICO, WATER YEAR 1989.
Geological Survey, Albuquerque, NM. Water Resources Div.
J. Borland, R. K. DeWees, R. L. McCracken, L. Lepp, and D. Ortiz.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-252040. Price codes: A19 in paper copy, A03 in microfiche. USGS-Water Data Report-NM-89-1. USGS/WRD/HD-90/276, April 1990. 426p. Prepared in cooperation with the State of New Mexico and with other agencies.

Descriptors: *Hydrologic data, *New Mexico, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water level, Water temperature.

Water-resources data for the 1989 water year for New Mexico consist of records of discharge and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels and water quality in wells and springs. This report contains discharge records for 166 gaging stations; stage and contents for 26 lakes and reservoirs; water quality for 56 gaging stations and 84 wells; and water levels at 104 observation wells. Also included are 108 crest-stage partial-record stations. Additional water data were collected at various sites, not involved in the systematic data collection program, and are published as miscellaneous measurements. Also, two seepage investigations are published this year. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in New Mexico. (See also W90-06444) (USGS)
W91-01828

WATER RESOURCES DATA FOR NEBRASKA, WATER YEAR 1989.
Geological Survey, Lincoln, NE. Water Resources Div.
J. A. Boohar, C. G. Hoy, and M. J. Ellis.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-251893. Price codes: A19 in paper copy, A03 in microfiche. USGS-Water Data Report-NE-89-1. USGS/WRD/HD-90/268, April 1990. 437p. Prepared in cooperation with the State of Nebraska and with other agencies.

Descriptors: *Groundwater, *Hydrologic data, *Nebraska, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water level, Water temperature.

Water-resources data for the 1989 water year for Nebraska consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality in wells. This report contains discharge records for 160 streamflow gaging stations, 12 partial-record or miscellaneous streamflow stations, and 5 crest-stage, partial-record streamflow stations; stage and content records for 11 lakes and reservoirs; water quality records for 38 streamflow stations, 8 ungaged stream-sites, and 159 wells; and water level records for 55 observation wells. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Nebraska. (See also W90-06429) (USGS)

WATER RESOURCES DATA FOR OREGON, WATER YEAR 1989, VOLUME 1. EASTERN OREGON.
Geological Survey, Portland, OR. Water Resources Div.
L. E. Hubbard, R. L. Moffatt, T. A. Herrett, R. L. Kraus, and G. P. Ruppert.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-251885. Price codes: A10 in paper copy, A02 in microfiche. USGS-Water Data Report-OR-89-1. USGS/WRD/HD-90/287, May 1990. 197p. Prepared in cooperation with the State of Oregon and with other agencies.

Descriptors: *Hydrologic data, *Oregon, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water level, Water temperature.

Water-resources data for the 1989 water year for Oregon consists of records of stage, discharge, and water quality of streams; and stage, contents, and water quality of lakes and reservoirs. This report, in two volumes, contains discharge records for 251 gaging stations; stage only records for 7 gaging stations; stage and contents for 39 lakes and reservoirs; water quality for 43 stations, and water quality for 3 precipitation stations. Also included are 5 crest-stage, partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Oregon. (See also W90-07847) (USGS)

WATER RESOURCES DATA FOR IOWA, WATER YEAR 1989.
Geological Survey, Iowa City, IA. Water Resources Div.
D. J. O'Connell, M. J. Liszewski, R. B. Lambert, and W. J. Matthes.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-222423/AS. Price codes: A18 in paper copy, A03 in microfiches. USGS Water Data Report IA-89-1. USGS/WRD/HD-90/256, 1989. 399p. Prepared in cooperation with the Iowa Department of Natural Resources (Geological Survey Bureau) and other agencies.

Descriptors: *Groundwater, *Hydrologic data, *Iowa, *Surface water, *Water quality, Chemical analysis, Data collections, Flow rates, Gaging stations, Groundwater level, Lakes, Reservoirs, Sampling sites, Sediments, Streamflow, Temperature, Water, Water analysis, Water level.

Water resources data for the 1989 water year for Iowa consist of record of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; groundwater levels and water quality of groundwater wells. This report contains records of water discharge for 117 stream-gaging stations; stage or contents for 8 lakes and reservoirs; water quality for 6 stream-gaging stations; sediment records for 10 stream-gaging stations; water levels for 185 observation wells; and chemical analyses for the 135 municipal wells. Also included are 113 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous discharge measurements and miscellaneous water-quality analyses. WATER RESOURCES DATA FOR WEST VIRGINIA, WATER YEAR 1988.
Geological Survey, Charleston, WV. Water Resources Div.
S. M. Ward, J. A. Macy, F. M. Taylor, and G. M. Ferrell.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-222589. Price codes: A09 in paper copy, A02 in microfiche. USGS Water Data Report WV-88-1. USGS/WRD/HD-90/248, 1990. 185p. Prepared in cooperation with the State of West Virginia and other agencies.

Descriptors: *Groundwater, *Hydrologic data, *Surface water, *Water quality, *West Virginia, Chemical analysis, Flow rates, Gaging stations, Sampling sites, Sediments, Water analysis, Water level, Water temperature.

Water resources data for the 1988 water year for West Virginia consist of records of stage, discharge, and water quality of streams; contents of reservoirs; and water levels of observation wells. This report contains discharge records for 79 streamflow-gaging stations; stage only records for 7 gaging stations, and 2 crest-stage partial-record stations; (2) change in contents for 1 reservoir; (3) water quality records for 15 streamflow-gaging stations; and (4) water level records for 30 observation wells. Locations of these sites are shown. Additional water data were collected at various sites, not involved in the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in West Virginia. (USGS)

WATER RESOURCES DATA FOR MICHIGAN, WATER YEAR 1989.
Geological Survey, Lansing, MI. Water Resources Div.
S. P. Blumer, J. C. Failing, W. W. Larson, C. R. Whited, and R. L. LeuVoy.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-230947/AS. Price codes: A13 in paper copy, A02 in microfiche. USGS Water Data Report MI-89-1. USGS/WRD/HD-90/255, 1990, 283p. Prepared in cooperation with the State of Michigan and with other agencies.

Descriptors: *Groundwater, *Hydrologic data, *Michigan, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Sampling sites, Sediments, Water analysis, Water level, Water temperature.

Water resources data for the 1989 water year for Michigan consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water temperature of groundwater. This report contains discharge records for 145 streamflow-gaging stations; stage only records for 13 lake-gaging stations; stage and contents for 5 lakes and reservoirs; water quality records for 21 streamflow-gaging stations; water level records for 51 observation wells; and water temperature records for 4 observation wells. Also included are 48 crest-stage partial record stations and 8 low-flow partial-record stations. Additional water data were collected at various sites not involved in the systematic data collection program. Miscellaneous data were collected at 62 measuring sites and 10 water quality sampling sites. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State, Local and Federal agencies in Michigan. (See also W90-05242) (USGS)
W91-01864

GROUND-WATER LEVELS, SPRINGS 1985, AND GROUND-WATER LEVEL CHANGES, SPRING 1983 TO SPRING 1985, IN THREE BASALT UNITS UNDERLYING THE COLUMBIA PLATEAU, WASHINGTON AND OREGON.
Geological Survey, Tacoma, WA. Water Resources Div.
R. C. Lane, and K. J. Whiteman.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 88-4018, 1989. 4 sheets, 4 fig, 20 ref.

Descriptors: *Aquifer systems, *Columbia Plateau, *Geohydrology, *Geologic units, *Groundwater movement, *Maps, *Oregon, *Washington, Columbia Basin Irrigation Project, Wanapum Basalt, Water resources data.

Groundwater level contour maps for three basalt units of the Columbia Plateau regional aquifer system were constructed by using water levels measured in 1,105 wells during 1985. These measurements then were compared with similar measurements from spring 1983 to assess the changes in groundwater levels over the 2-year period for each of the basalt units. Configuration of the groundwater contours and water level changes reflect (1) recharge and discharge; (2) hydraulic conductivity; (3) use of imported surface water for irrigation; and (4) pumpage of groundwater. The movement of groundwater within each basalt unit is controlled mainly by the major rivers, streams, and coulees, whereas variations in flow directions between units are related to the occurrence, extent, and hydraulic conductivity of the basalt units and sedimentary interbeds and to differences in the amounts of recharge to each unit. DESIGN OF ROCK SLOPES IN SOVIET HYDROPOWER CONSTRUCTION PRACTICE.
V. I. Reznikova, and V. I. Rechitskii.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 669-674, June 1990. 5 fig, 1 tab, 4 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 4-8, December 1989.

Descriptors: *Construction methods, *Dam construction, *Engineering geology, *Hydroelectric plants, *Rock mechanics, *Slope stability, Blasting, Drilling, Mathematical analysis, Mathematical studies, Shear stress, Structural engineering, USSR.

Since 1970, the All-Union Planning, Surveying, and Scientific Research Institute (Gidroproekt) has been calculating the stability of natural slopes and rock slopes of foundation pits, canals and other structures of hydroelectric stations and pumped-storage stations. In all, the stability of slopes with heights of 15-125 m at 20 Soviet hydropower facilities were analyzed. The most widely-used methods for calculation of rock slope stability were the deficit forces method and the method of shear along a plane surface. The form of the sliding limit surface depended on the fracture character of the mass, topography and the kinematic failure possibility. Stability was calculated mainly as a two-dimensional problem, since long slopes in which the effect of side surfaces could be neglected occurred in most cases. The purpose of these calculations included not only a determination of the slope stability factor for given parameters of fracturing and shear strength, but also an evaluation of the effect of the latter on stability. Analysis of the stability of artificial slopes proceeded as follows: on the basis of a model of rock mass fracturing constructed by engineering geologists, a number of

ossible sliding surfaces were outlined and the ability of the rock slope with an initial steepness ontour) value was calculated. Generally, an it- ative cycle of stability calculations was carried it for different values of the dip angles of the ear-dangerous fractures and for the purpose of ding the rock mass region with a minimum lue of the stability factor K. If K was greater an the standard value Ks, the contour of the ture slope was adjusted steeper, otherwise a re gentle slope was recommended or a variant its stabilization was calculated. Design-related lures of masses were not observed in any of the signed slopes. The conditions for, and the pa- neters of, drilling and blasting operations have a ticeable effect on slope stability and angle, indi- ing the need for thorough development and orous observance of drilling and blasting oper- on plans. At a number of hydropower facilities, ailed stability calculations made it possible to ninate costly engineering measures and reduce ject costs. (Hoskin-PTT)

iptors: *Concrete technology, *Construction ods, *Load testing, *Retaining walls, *Struc- engineering, Construction joints, Locks, ematical analysis, Mathematical models, Me- al engineering, Reinforced concrete, Struc- nodels, Waterways.

isting retaining structures, which exhibit de- ns in performance from design premises, an ve reinforcement system should be devel- to reduce active loads with a simultaneous se in bearing capacity and a reduction in ure deformability. Experimental investiga- f lightly reinforced concrete models of walls :8 scale (with respect to the lock walls of the Moscow Canal) were performed. The structural components of the reinforcing system were an additional wall (metallic or reinforced-concrete in the form of sheet piling, wall in the ground) and inclined components (metallic or reinforced-concrete girders or cross pieces), which transmitted the load from the additional wall to the front face of the existing wall. The wall models were tested under a static short-term load applied in increments of 0.05 of the computed failing load, Qc. Crack formation in the experimental wall was characterized by the formation and vigorous development of a crack along the construction joint of the second concrete lift and an inclined crack leading away from the joint under a load of 21.4 kN; the failing load was 25.68 kN; this was more than one and one-half times smaller than the Qc value. The mounting of two planes of inclined yokes led to partial restoration of the wall's bearing capacity as compared with the computed Qc value. Installation of an additional wall from which the external load is transmitted onto the concrete wall using two planes inclined at a 12 degree angle to the horizontal made it possible to reduce somewhat the width of the joint opening of the second concrete lift under a load of $>$ 24.0 kN as compared with tests performed without the additional wall. The data obtained for the increase in limiting load that can be taken up by the reinforced wall suggest a significant reduction in bending moments and an increase in the longitudinal (vertical) compressive forces due to transfer of external forces from the additional wall through the force components onto the concrete wall at an angle of alpha-2 = 38 degrees to the horizontal. MONITORING THE STATE OF THE DAM OF THE SAYANO-SHUSHENSKOE HYDROELECTRIC STATION.
A. I. Efimenko, K. K. Kuz'min, and E. K. Aleksandrovskaya.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 10, p 573-577, April 1990. 3 fig, 5 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 10, p 15-18, October 1989.

Descriptors: *Dam foundations, *Hydraulic engineering, *Hydraulic structures, *Hydroelectric plants, *Measuring instruments, *Soviet Union, Dam stability, Foundation rocks, Monitoring, Piezometers, Stress analysis.

The Sayano-Shushenskoe (Soviet Union) dam is a unique hydraulic structure. Because high reliability demands are imposed on it. A considerable number of on-site observations and investigations are performed to monitor the reliable operation of the dam. The monitoring system includes geodetic, piezometric, and flow monitoring and measuring instruments (MMI) that were installed during construction of the dam, its components, and the rock foundation, making it possible to observe the structure and evaluate its state at various stages of construction and filling of the reservoir. During current monitoring on the dam the main parameters characterizing the static behavior of the dam foundation system are evaluated: the total displacements (settlements, tilts, horizontal displacements), state of the rock-concrete contact; state of the horizontal joints between blocks, sections, and columns; cracking in the concrete; and the seepage pressure in the concrete and rock foundation. The results of long-term monitoring of the dam indicate a satisfactory state of the structure at all stages of filling the reservoir and correspondence of the values of the parameters being monitored on site to their design premises, with the exception of stresses near the downstream face. To obtain representative information it is necessary to provide in the design for routine correction of the layouts of the MMI, particularly embedded instruments. (Fish-PTT)

Descriptors: *Cold weather construction, *Dam construction, *Dams, *Hydraulic structures, *Hydroelectric plants, *Soviet Union, *Stress analysis, Dam design, Deformation, Earth dams, Reservoirs, Rockfill dams, Temperature effects.

The harsh natural and climatic conditions and year-round operation of hydroelectric stations at low negative air temperatures cause substantial changes in temperature and moisture state (TMS) of materials being placed in earth-rock dams in the Far North of the Soviet Union. On-site and experimental investigations of the TMS and stress-strain state of the upstream shoulder during filling of the reservoir were carried out to predict deformations of the earth-rock dam of the Kureika hydroelectric station. The results of the 2-year on-site observations of the behavior of the earth-rock dam being constructed under conditions of the Far North during filling of the reservoir permit the following conclusions: (1) rapid temperature and deformation processes occurred in the frozen upstream shoulder of the dam during its primary subirrigation; (2) under unfavorable deformation conditions, the formation of cracks is possible and in these cases special designs providing static and seepage stability of the structures are necessary; (3) the calculated strength and deformation characteristics should be assigned differentially depending on the working conditions of dams in the initial operation period; (4) special consideration should be devoted to the size and deformability of the transition zones which perform the role of a buffer between the core and shoulders; (5) mined rock should be placed uniformly over the entire area in layers with compaction by heavy vibrating rollers; and (6) on-site observations of the TMS and deformations of the upstream shoulders should be performed during their construction and operation in order to refine the design parameters of dams being constructed in the Far North. The slopes of rockfill and blast-formed dams often have unorganized heapings of stone, often in a

LIBRARY U. OF I. URBANA-CHAMPAIGN

loose state relative to the dam body. To prepare such a slope for a reinforced-concrete facing, it is necessary to carry out considerable crushing, leveling, and compaction of the stone. However, this work often need not be performed if the facing on such a dam is made of poured asphalt. The depth of penetration of asphalt under the effect of its own weight into the pores of the rockfill with one-time pouring is determined by an empirical relation. The larger the size of the rock and the higher its porosity, the deeper the penetration of asphalt into it during pouring. However, the rock must most often be covered several times, counting on its flow into the pores of the fill between pourings. The formation of the given facing is quite simple and consists of: crushing of large rocks on the slope with subsequent grading; washing of the rock distributed over the slope not later than a day before covering it with asphalt by a pressure jet of clean water delivered to the slope through hoses; covering the rock with poured asphalt after its surface dries; holding the formed coating for a time during which the asphalt penetrates into the fill pores to the prescribed depth; a repeated leveling and covering of the rock with poured asphalt. Using empirical relations, for a known fractional composition of the rock a composition of the asphalt mass can be selected such that its penetration into the fill pores will be optimal. Thus facings of rockfill and blast-formed dams of rock covered with poured asphalt are easily designed and easily made, which opens broad opportunities for their use. (Fish-PTT)

GEODETIC PROBLEMS IN THE CONSTRUCTION OF HIGH CONCRETE DAMS.
D. M. Grachev.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 661-664, 1990. 4 fig. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 36-38, November 1989.

Descriptors: *Arch dams, *Concrete dams, *Dam construction, *Dam design, *Dams, *Deformation, *Geodesy, *Gravity dams, *Hydraulic structures, *Soviet Union, Dam foundations, Dam stability, Gravity-arch dams, Hydraulic geometry.

A high-head dam under construction undergoes deformation under the water head, its own weight, and other factors. The dam shifts along the foundation, moves vertically, and tilts or bends. The deformations increase with an increase of the dam height and head of water, as a consequence the elements of the structure are noticeably displaced. Other discrepancies are then noted between the constructed part of the dam and its overlying part, which is still to be constructed. Discrepancies are also noted while performing geodetic location work for the overlying concrete levels. In designing high concrete dams of the arch and gravity-arch types it is necessary to provide special measures for geodetic construction provisions. A change to a system that involves location axes that move in space together with the dam under construction is recommended. This approach requires calculated predictions of the magnitude of deformations and data from on-site observations of the structure under construction. This approach was used for constructing the Sayano-Shushenskoe Dam. The points of the geodetic base, metal surface markers, were embedded every other section at a distance of 35 to 50 m from one another along the lower face of the dam around its perimeter (here final construction had to be put off until last). The coordinates of the points were determined by a geodimeter survey from points on the geodetic base of the construction site as of a certain date. The points of the geodetic base, once determined on the structure, are kept until the end of construction. They can then be raised from tier to tier along the plumb line. (Korn-PTT)

Powerplant cooling systems that entrain large volumes of seawater in multiple discharge jets can produce changes in the local field of flow. A case history of observed flow modification is provided by dye studies and records of currents around the diffusers of the San Onofre Nuclear Generating Station (SONGS), which entrain a volume of flow on the order of 1000 cu m/s. Field observations of dilutions and velocities in the discharge plume agree well with the results of hydraulic modelling of the diffuser system. Synoptic observations and long term statistical distributions of current speeds and directions show systematic patterns of altered flow around the diffusers that are more complex than the flow in the model because of interactions with flow modification by local beds of giant kelp. J. G. Dickens, and G. H. Mortimer.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 227-234. 8 fig, 5 ref, June 1990.

Descriptors: *Check structures, *Domestic water, *Hydraulic loading, *Load testing, *Water metering, Backfill, Design criteria, Field tests, Vertical flow, Water boundary.

The results of a series of load tests carried out on a variety of designs of boundary boxes which are intended for use as stopcock/water meter chambers at domestic properties are presented. A test which was developed at Loughborough University to measure the performance, under load, of the complete boundary-box units in simulated site conditions was used. Three broad classifications of different design types were identified, namely rigid, flexible, and sliding; and the load displacement of each type are presented. The effects of rate of loading and different backfill conditions were considered, and conclusions were drawn on suitable performance specifications under load. A wide spread of performance within each design type was found. The units of the rigid design type were the only ones to approach the load-displacement performance of traditional claywire units, and not all rigid types would meet all criteria. Field tests on flexible boxes, which did not meet load criteria, correlated well with observed characteristics in sandbox tests. Sliding units also did not meet load criteria; but their load capacity was increased where quarry waste backfill was used. In conclusion, where vehicle loading is possible, a rigid type unit should be used. (VerNooy-PTT)

HYDRAULIC CALCULATION OF OPEN GROINS WITH VARIABLE COVERAGE.
M. R. Bakiev, and N. P. Togunova.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 684-688, June 1990. 3 fig, 1 tab, 5 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 14-17, December 1989.

Descriptors: *Groins, *Hydraulic design, *Hydraulic models, Flow around objects, Flow models, Flow velocity, Hydraulic engineering, Mathematical analysis, Mathematical equations, Mathematical studies, River flow, Soviet Union.

Open groins are finding wide use in protection and regulation on rivers with a sand and loam channel. To eliminate the possibility of the flow bypassing the groins from the side of the bank being protected (from the root), they are made with variable coverage. The construction of such groins creates at their root in the upper pool a certain 'water cushion' protecting the structure from the flow

ypassing from the root, and the effectiveness of iminishing the velocities is higher than for ordiary open groins with a constant coverage, which an be achieved both with the arrangement of the lements of the groin in one row and several rows. he coverage factor is equal to the ratio of the rea occupied by elements of the groin to the area f the channel being covered by the groin. The otal coverage factor should not exceed 0.65, i.e., ie limit after which the open groin begins to work s a closed one. Assigning the value of the coverge coefficient P < = 0.65, the number of elements necessary for the groin was determined. Experiental and theoretical investigations were conucted to study the work of open groins of the escribed design. An analysis of measurements of e level regime of the flow deformed by the open roin with a variable coverage showed that it udergoes changes mainly in the immediate vicinity of the groin, and on the remaining parts of the ngitudinal and transverse velocity differences are iall. An analysis of the velocity distribution in an revealed the presence of zones with small and rge transverse velocity differences, which was e basis for using certain principles of the theory turbulent jets, in particular, the schemes of vision of the flow into hydraulically homogenes zones. The results of the investigations were ed by the Central Asia Institute for Water Maement in Cotton-Growing Regions when select variations for regulating the Amu Darya River annel in the region of the damless water intake the Karshi main canal. e conduits are widely used as dam spillways, d culverts, diversion tunnels, offtake regulators, A hydraulic analysis of these structures is not iciently accurate without appropriate consider- n of the actual water flow conditions through n. Accordingly, the parameters were deter- ed for a freely spreading rapid flow beyond sure pipe conduits with consideration of the e-dimensional character of the flow. The prob- was solved by an experiment performed on a ratory model of a pipe outlet. During the riment the form factor of the jet, N, was ed in the range 1.52-2.19 and the relative head varied in the range 2.05-11.27. Free spreading investigated in a wide lower pool with a three- nsionality factor indicating unlimitedly-wide r pool. The experimental investigation includ- determination of the coordinates of the bound- of the free spreading, depth, mean pressures ie bottom, and mean velocities over the axis of preading flow. The results of these investiga- demonstrated that existing analytical and exnental methods of calculating the parameters ee spreading of a flow in the lower pool nd pressure pipe conduits do not give acceptaesults for N > 1, since the flow has a proced three-dimensional character. When evalu- the kinetics of the flow in the exit section the use of its integral form, it is possible to nate the substantial effect of N on parameters ee spreading. The empirical relations obtained it possible to calculate more accurately the neters of free spreading of a rapid flow nd pressure pipe outlets. (Hoskin-PTT)

EGULAR WAVE LOAD ON SLOPES OF UCTURES.
Shaitan, and D. V. Morozova.
otechnical Construction HYCOAR, Vol. 23, 2, p 699-703, June 1990. 3 fig, 5 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 24-27, December 1989.

Descriptors: *Hydraulic engineering, *Hydraulic models, *Sloping waves, *Wave action, Hydraulic design, Mathematical analysis, Mathematical equations, Mathematical studies, Storms.

The chaotic characteristics of various irregular wind-wave processes can be reliably determined using functions having scientific and practical applicability. This was demonstrated by examining a non-erodible continuous slope, the most distinct manifestation of the group effect of wind systems on an obstacle. Under conditions of a random combination of complex factors and particular kinetics of breaking of dissimilar waves creating an unsteady hydraulic regime in the water-line region, the load acting on the slope requires a probabilistic interpretation in analogy with that used for wind-wave characteristics in the quasi-storm period. Replacement of the monochromatic principle of determining the wave load on slopes by a differentiated action with respect to probability of the process in a storm or in a representative quasi-steady system makes it possible to increase the technical and economic effectiveness of material expenditures in the construction and operation of objects of various types, purpose, operating conditions, service life, etc., and at the same time to ensure a high reliability of the structures. To study the new probabilistic regularities of the force effect of irregular waves on slopes under real storm conditions, permanent (several year) investigations were set up on several objects, which made it possible to collect numerous on-site data sets. Unlike a regular wave load, an irregular wave load depends explicitly on the steepness of the slope, with a tendency toward an increase of this effect on a more gentle slope than a decrease of the numerical value on the load on a steeper slope. The on-site data on irregular wave pressure and total load on slopes can be used on various water areas, since the integral distribution functions of the wave characteristics in their representative systems had a completely satisfactory convergence with analogous distribution functions characteristic for other water areas, including with the standard values used for a wide range of water bodies. PREDICTING WAVE FORMATION IN MOUNTAIN RESERVOIRS DURING LANDFALLS AND LANDSLIDES.
T. L. Gvelesiani, B. N. Ostroverkh, G. Y. Dzhindzhikhashvili, S. O. Eranosyan, and V. I. Reznikova.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 725-730, June 1990. 5 fig, 10 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 46-49, December 1989.

Descriptors: *Dam design, *Dam failure, *Hydraulic engineering, *Landslides, *Reservoirs, *Wave formation, Geophysics, Mathematical analysis, Mathematical equations, Mathematical models, USSR, Wave height.

Wave formation as a result of landslides into closed pools, bays and fjords has recently attracted the attention of hydraulic engineers. Prediction of the parameters of landslide-induced waves is broken down into a series of problems, which are related to the different fields of continuum and fracture mechanics: determination of the stress-strain state and slope stability on the sides of the reservoir; the separation, movement and immersion of the separated mass in the water; the formation and propagation of waves on the surface of the water; and, the interaction between the waves and the retaining or shore structures. Analytic analysis of the first group of problems is based primarily on the theory of elasticity and plasticity and lies in the field of geomechanics. For the second group of problems, modification of the hydraulic model of a one-dimensional fluid flow is used to describe the rapid motion of large rubbly masses. The last two groups of problems are investigated on the basis of methods of hydromechanics using computational geometric and kinematic parameters, as determined, respectively, as a result of solution of the previous problems, and as initial data (boundary conditions). These methodologies were applied to the study of wave formation in the reservoir formed by the Getiksk hydraulic facility with a dam built of local materials (53 m high) on the Chichkhan River in the Armenian republic. The rate of wave formation in the reservoir is governed primarily by the volume of the landfall body and by the rate landfall immersion. A frictional model of the motion of a quasideformable landfall block along a plane surface (the shoreline slope and bottom of the reservoir) was used for a characteristic of the kinematic indicators of a landfall with a volume of ca. 1 million cu m. These calculations indicated that a wave that will top the crest of the dam can form during such a collapse. The design therefore specifies a 3-m increase in the dam's crest, and the construction of a wave-protection dike. (Hoskin-PTT)

HYDRODYNAMIC PRESSURE ANALYSIS OF ARCH DAMS WITH T-COMPLETE FUNCTIONS.
Ohio State Univ., Columbus. Dept. of Civil Engineering.
K. Sun, and F. C. Hadipriono.
Journal of Engineering Mechanics (ASCE) JENMDT, Vol. 116, No. 9, p 2054-2069, September 1990. 10 fig, 10 ref.

Descriptors: *Arch dams, *Hydraulic engineering, *Hydrodynamics, *Model studies, *Water pressure, Boundary conditions, Canyons, Dam design, Numerical analysis, Stream banks.

The analysis of hydrodynamic pressure on arch dams is a practical yet complex engineering topic. To solve this problem numerically with the boundary element method (BEM), a semi-analytical and semi-numerical approach in the fluid domain may be used. The hydrodynamic pressure acting on the upstream face of arch dams has been explored by a special BEM based on the use of a complete and nonsingular set of Trefftz functions. The arch dam, bounded by a limited, arbitrary irregular part and an unlimited regular part of the river valley, was considered to be in an arbitrary shape. using this method, one can accurately model the compressibility of the water and the gravity waves on the water surface. Numerical examples illustrated the effects of the canyon shape and the bank angle from the symmetry axis. The hydrodynamic pressure on an arch dam will be reduced significantly by decreasing the value of the half-width on the dam bottom. The shape of the canyon slope has an important effect on the pressure for cross-canyon excitation, but it has little effect on upstream-downstream excitation. Comparisons with other numerical solutions show complete agreement. (Fish-PTT)

Descriptors: *Channel flow, *Flow friction, *Flow models, *Froude number, *Hydraulic properties, *Model studies, *Waves, Friction loss, Open-channel flow, Reynolds number, Uniform flow.

It is well known that in steep channels, the flow becomes unstable when the Froude number exceeds some critical value. Instead of obtaining uniform flow, a short distance from the channel inlet/ waves of various lengths, amplitudes, and phase velocities appear. These waves, traveling downstream and occasionally overtaking each other, are called roll waves. The value of the friction factor in open channels in unstable flow conditions is affected by the Froude number. Some formulas for the calculation of the friction factor in unstable flow conditions have been suggested previously. After these formulas were checked for smooth channels, the formulas for rough channels were compared with measurements. The critical Froude number, which is presented as a function of the Reynolds number, the channel roughness, the vertical velocity distribution coefficient, and the channel width, is found to be an important parameter. A generalized formula computes the friction factor both in smooth and rough channels in unstable supercritical flow conditions. The experiments carried out confirm the increase of the friction factor in unstable flow in rough channels. (Author's abstract)

ADVECTION SIMULATION BY MINIMAX-CHARACTERISTICS METHOD.
Hong Kong Polytechnic, Kowloon. Dept. of Civil and Structural Engineering.
C. W. Li.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 9, p 1138-1144, September 1990. 3 fig, 10 ref.

Descriptors: *Advection, *Dispersion, *Finite difference methods, *Groundwater movement, *Hydrodynamics, *Model studies, Fourier analysis.

The advective transport of a scalar has been simulated by using the minimax-characteristics method, which is an explicit and efficient finite difference scheme derived from the local minimax approximation of the exact solution of the pure advection equation. Fourier mode analysis shows that the method is unconditionally stable, and produces relatively small celerity error and little amplitude dissipation. The scheme compares favorably with the other commonly used backward characteristics schemes: it is better than the scheme using quadratic interpolation (higher accuracy, approximately equal computational effort), and is better than the schemes using cubic interpolation (approximately equal accuracy, less computational effort); it is less accurate than the scheme using Hermitian cubic interpolation, but requires only one-half the computational effort. By interpreting the scheme as a backward characteristics scheme with quadratic approximation of the exact solution over four nodes, the extension of the method in a split-operator approach for advection-dispersion and hydrodynamics modeling in two or three dimensions is straightforward. WHAT RESULTS WHEN THE BUILDING CODES ARE NOT OBSERVED.
E. S. Lyubashevskii, and V. Y. Martenson.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 10, p 612-615, April 1990. 1 fig, 2 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 10, p 42-44, October 1989.

Descriptors: *Building codes, *Construction methods, *Hydraulic design, *Hydraulic engineering, *Hydroelectric plants, Design criteria, Hydraulic gates, Installation, Maintenance, Mechanical equipment, Safety, Soviet Union.

In recent years the construction of hydropower plants in the Soviet Union has been carried out increasingly more often where the units are put into operation temporarily, i.e., long before completion of all construction and assembly works on the dam structures. According to the 'Standards for the Technological Design of Hydroelectric Stations,' the mechanical equipment intended for operation in the construction period should be designed according to the standards used for the operating period, which allows for operation of the mechanical equipment according to the temporary scheme with adjustments as the structure 'grows.' Ahead-of-schedule flooding of the pit deprives the operation of proper installation and start-up adjustments. Standards regulating the opening size of gates are often violated by designers of hydraulic structures. Nonsynchronized hoisting operations with cranes is the grossest violation of the 'Rules of the arrangement and safe operation of cranes, in which it is forbidden to raise and move a restrained load. The operating reliability of gates also depends on the installation and quality of concreting the embedded parts, which is not always satisfactory. Start-up and adjustment operations should be formulated and carried out according to requirements in newly developed guides (in place of the abolished sections of the building code). Before publication of the new guide ('Manufacture, installation, and acceptance of mechanical equipment of hydraulic structures'), all requirements of the building codes and standards of the technological design of hydrostations should be fulfilled by all participants in the creation of mechanical equipment and hydraulic structures. INVESTIGATION OF THE DIVERSION OUTLET OF THE KIRZAN HYDRO DEVELOPMENT.
G. L. Mazhbits, and V. N. Kurdyukov.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 628-631, 1990. 3 fig. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 12-14, November 1989.

Descriptors: *Diversion structures, *Hydraulic design, *Hydraulic equipment, *Hydraulic models, *Hydraulic structures, *Outlets, *Soviet Union, Dams, Design criteria, Hydroelectric plants, Model studies, Reservoirs.

The diversion outlet of the Kirzan hydro development was investigated with a hydraulic model on a scale of 1:50. A check of the initial design variant of the outlet showed design imperfections. The originally designed diversion outlet consists of a three-bay intake, a pipe with a section of 8 x 8 m, and expanding outlet portal. The middle opening has a width of 8 m and the extreme ones 4 m each. The low-flow discharges pass through the three openings, and after reaching a reservoir level of 72 m, the extreme openings are covered by stoplogs and no longer operate. After flood waters recede and subsequent partial drawdown of the reservoir, the middle opening is also closed and the division outlet is taken out of further service. As a result of the experimental investigation on a hydraulic model, an improved design of the diversion outlet was obtained, which has practically the same construction volume and elements. When compared with the original variant it has several advantages. It has a higher discharge capacity at low levels and a lower capacity at high reservoir water levels. The new design provides an allowable maximum fall during damming of the river channel and it provides the maximum allowable discharge at the highest water level in the reservoir. The new diversion outlet guarantees a free flow in the pipes in the entire range of discharges and it has a better spreading and dissipation of the energy of the flow in the lower pool. Finally, the new outlet design provides a 25% smaller depth of scouring in the lower pool and prevents local scouring of the tailwater channel in the immediate vicinity of the structure. (Korn-PTT)

EFFECT OF THE RIGA HYDROELECTRIC STATION ON THE CURRENT VELOCITY NEAR WHARVES OF THE RIGA COMMERCIAL SEAPORT.
G. Y. Segal, and E. L. Tsoneva
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 631-633, 1990. 2 fig. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 15-16, November 1989.

Descriptors: *Channel erosion, *Channel flow, *Channel morphology, *Channel scour, *Dam effects, *Hydroelectric plants, *Hydrologic regime, *Soviet Union, Channel improvement, Economic evaluation, Hydraulic design, Hydraulic equipment, Hydraulic machinery, Hydraulic structures, Hydroelectric power, Velocity.

The Riga commercial sea port (RCSP) is located at the mouth of the Daugava River. The operation of the Riga hydroelectric station (1974) completely changed the hydrological regime in the lower pool of the station, in which the port was located. A prediction of the transformation of the Daugava channel as a consequence of these changes was made by the Latvian Urban Planning Institute. These predictions were based on the technological regime of the planned hydrostation. The more than 10-year period of hydrostation operation showed that although operating as a peak-load station in a daily regulating regime with two releases, there are considerable differences from the design regime. The differences between the design and actual operating regime of the hydrostation led to a considerable deviation of channel deformation downstream from the station when compared with the prediction. The channel of the lower course of the river is composed mainly of medium-grained sands in the size range 0.25-0.50 mm. For these grains, the permissible bottom velocity does not exceed 0.25 m/sec. Actually, the velocities occurring during operation of all units of the Riga hydrostation are considerably higher. These high velocities are the main cause of the channel scouring. Large and costly hydrotechnical works will be required to prevent further dangerous deformations of the Daugava channel near the wharves of the RCSP. (Korn-PTT)

LOCAL ENERGY LOSSES IN TWO-COMPONENT PRESSURE FLOWS.
B. M. Levin, A. N. Lopatin, and V. F. Boiko.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 634-638, 1990. 1 fig, 1 tab, 17 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 16-19, November 1989.

Descriptors: *Cavitation, *Flow characteristics, *Flow friction, *Flow resistance, *Head loss, *Hydraulics, Agriculture, Flow equations, Hydraulic friction, Hydraulic transportation, Hydroelectric plants, Land reclamation, Multiphase flow, Slurries.

Systems of hydraulic transport of solid materials have presently become widespread in various areas of agriculture, hydrotechnical construction, industry, and land reclamation. Most developments and investigations of the two-phase flows associated with these hydraulic transport systems pertain mainly to a determination of their transporting capacity. Even less studied is the problem of determining the head losses of slurries due to local hydraulic resistances (in an abbreviated form, local losses). At the same time, local head losses in some cases make a substantial contribution to the calculation of hydraulic transport systems, and sometimes are the factor determining this calculation (e.g., the suction lines of systems, short slurry pipelines). Local losses during movement of slurries representing a mixture of water and solid material (mainly quartz sands) were investigated

Along with this, mixtures of water with polymer additives (mainly polyacrylamide, PAA), which under certain conditions can considerably reduce hydraulic friction in a turbulent pressure flow were also investigated. The presence in two-component flows of a second component in the form of solid inclusions (with a particle size up to 25 nm) or polymer additives (reducing the linear head losses in uniform turbulent flows) does not affect the extent of local hydraulic resistances expressed in fractions of the velocity head of the mixture. This conclusion was indirectly confirmed by the discharge coefficients of contracting devices (flowmeters) and the cavitation characteristics of centrifugal pumps. (Korn-PTT)

HYDRAULIC JUMP IN TRIANGULAR CHANNEL.
Ecole Polytechnique Federale de Lausanne (Switzerland). Dept. de Genie Civil.
W. H. Hager, and R. Wanoschek.
Journal of Hydraulic Research JHYRAF, Vol. 25, No. 5, p 549-564, 1987. 12 fig, 16 ref.

Descriptors: *Hydraulic geometry, *Hydraulic jump, *Hydraulic properties, *Open-channel flow, *Spillways, *Tailrace, Channel morphology, Energy dissipation, Froude number, Hydraulic structures, Momentum transfer, Tailwater, Turbulent flow.

The main features of hydraulic jumps in trapezoidal channels were analyzed. In particular, the hydraulic jump in channels with triangular cross-sections was examined experimentally. The results were compared with data collected in channels with rectangular cross-sections. Based upon the equality of mass, energy, and momentum transfer in the inflow section, the hydraulic and geometric properties of the two jumps were correlated. The sequent depth ratio in the triangular channel was significantly lower; therefore, the tailwater depth of a rectangular channel must be much higher. As a consequence, the relative energy dissipation of the jump in the triangular channel was much higher (typically 30%). The jump in a triangular channel was almost two times shorter than the corresponding jump in a rectangular channel. However, the volume of the jump was about 30% higher in the triangular channel; the ratio of jump volumes increased almost linearly with the Froude number. The surface width at the end of the jump was larger in a triangular channel; therefore, lateral space limitations may become important. The sensitivity of the hydraulic jump to slight discharge variations was lower in the triangular channel; consequently, the sensitivity of slight tailwater variations was higher. (Miller-PTT)

escriptors: *Hydraulic engineering, *Pipe flow, *ipelines, *Scour, *Vibrations, Damage, Erosion, ow velocity, Hydraulic structures, Sagging.

pelines may be damaged by flow-induced vibran. Fatigue problems caused by pipe vibration ve received much attention, but little consideron has been given to the impact of vibrating pelines on their beds. The interaction between a rating pipe and an erodible bed was studied. pe vibration during sagging was emphasized. d scour below a pipeline is promoted by pipe ration. If the scour hole below a pipeline is ge enough, gravity and the flexibility of the eline can allow the pipe to sag into the scour e. Flow velocity is an important factor in proting vibration, but the eroded bed has a restric- effect on vibration. The distance between the e and the bed is also important. The pipe state be classified as (1) the pre-vibration stage, (2) lock-in stage, or (3) the lock-out stage. For erent pipe states, the amplitude response tendencies during sagging of the pipe are quite different. When the pipe is in the lock-in stage and very close to the bottom of the scour hole, the pipe may vibrate with such an amplitude that it may be damaged due to its impact on the scour hole. COMPARISON BETWEEN MEASURED WAVE PROPERTIES AND SIMPLE WAVE HINDCASTING MODELS IN SHALLOW WATER.
North Carolina Univ. at Morehead City. Inst. of Marine Sciences.
R. A. Luettich, and D. R. F. Harleman.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 4, p 299-308, 1990. 4 fig, 1 tab, 16 ref. U.S./Hungary Cooperative Science Program Grants INT-8112454 and INT-8411545 and NSF Grant ECE-8211525.

Descriptors: *Lakes, *Model studies, *Sediment transport, *Shallow water, *Waves, Comparison studies, Fetch, Hungary, Lake Balaton, Wave height.

The U.S. Army Corps of Engineers has published two versions of a simple shallow-water wave hindcasting model that has the potential for predicting characteristic wave properties. Significant wave heights and wave periods obtained from field measurements in Lake Balaton, Hungary, were compared with the two versions of this model. The earlier version was found to give very good hindcasts of wave height but fell approximately 20% low on wave period. The later model was 15-20% above the earlier version for winds directed along the axis of the lake and therefore having relatively long fetches. For short fetches, results from the two model versions were nearly the same. (Author's abstract)

ANALYTICAL ASYMPTOTIC SOLUTIONS FOR LONGITUDINAL DISPERSION WITH DEAD ZONES.
Contra Costa Water District, Concord, CA.
R. A. Denton.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 4, p 309-329, 1990. 5 fig, 1 tab, 33 ref.

Descriptors: *Dead zones, *Dispersion, *Mathematical analysis, *Path of pollutants, *Streamflow, Aris method of moments, Boundary conditions, Data interpretation, Mathematical studies, Rivers.

Longitudinal dispersion in rivers is the combined effect of the stretching of a dispersant cloud by differential advection and removal of the cross-sectional concentration gradients by cross-sectional mixing. Dispersant material can become temporarily trapped in separation or dead zones along the flow boundaries. Analytical solutions for the asymptotic behavior of two-dimensional flow with dead zones was obtained using the Aris method of moments. The spatial and temporal solutions demonstrated the relative contributions of main flow shear dispersion and dead zone trapping to the total rate of longitudinal dispersion. Steady-state equilibrium profile solutions for the variations in mass, centroid and variance over the flow cross-section were derived. While the centroid, variance and skew all increase linearly during the equilibrium period, the kurtosis increases quadratically, consistent with an eventual asymptote of the kurtosis coefficient to the Gaussian value of 3.0. KINEMATIC CASCADES: DERIVATION OF A GENERALIZED SHOCK FORMATION CRITERION.
Technische Univ., Vienna (Austria). Inst. fuer Hydraulik Gewasserkunde und Wasserwirtschaft.
B. H. Schmid.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 4, p 331-340, 1990. 2 fig, 16 ref.

Descriptors: *Hydraulic engineering, *Kinematic wave theory, *Overland flow, *Rainfall-runoff relationships, *Shock formation, Excess rainfall, Infiltration, Mathematical analysis, Model studies, Ponding.

Practical use of the kinematic-wave concept in engineering applications of the hydraulics and hydrology of overland flow frequently requires an extension termed the 'kinematic cascade', which allows the approximation of natural ground surface by a series of planes. Shock formation may present problems in the course of kinematic cascade modeling. When choosing an adequate algorithm of solution, it is important to know beforehand whether discontinuities are to be expected. A generalized criterion including cases of time-dependent rates of rainfall excess was derived. Kinematic shock formation on a cascade of infiltrating planes was found to be strongly dependent on the ratio of respective ponding times. If a kinematic cascade comprises two planes with overland flow on the upper one starting earlier than on the lower one, a shock will occur as soon as the rate of rainfall excess related to the upper plane becomes nonzero. In all other cases the generalized shock-formation criterion accounting for time-dependent infiltration is more complicated. Three different types of shock were identified, two of which are relevant to the problem considered. Accordingly, the derived criterion consists of two cases, both of which must be checked in the course of practical application. (Miller-PTT)

SCOURHOLE DEVELOPMENTS IN SHALLOW TAILWATER.
James Cook Univ. of North Queensland, Townsville (Australia). Dept. of Civil and Systems Engineering.
A. J. Johnston.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 4, p 341-354, 1990. 6 fig, 4 tab, 27 ref.

Descriptors: *Erosion, *Hydraulic structures, *Scour, *Tailwater, Experimental data, Hydraulic processes, Plane jet, Sediment transport, Shallow water.

An understanding of scour processes in areas where loose sediments are located near the foundations of hydraulic structures is normally required during analysis and design. The scourhole development of a plane jet entering shallow tailwater conditions was investigated. Through dimensional considerations and physical reasoning, the appropriate functional groups were identified. Experimental laboratory results were used to evaluate the functional relationships and show that in shallow conditions, the jet can produce three very different scourhole regimes. (1) For fairly small depth values, moderate bed offsets and small densimetric Froude numbers, a surface jet scourhole regime is likely where the jet is attached to the free surface. This scourhole is rarely observed in normal engineering applications. (2) For large depth values up to and beyond large offsets, a bed jet regime is observed where the jet is attached to the bed. This regime is the most commonly observed in engineering practice. (3) With moderate depths and moderate bed offsets, the jet flicks between boundaries. The period of this flicking cycle varies between 2 and 30 min and is dependent on tailwater depth. This transient regime has a number of important characteristics which need assessment in a number of engineering situations; for instance, the rate at which the scourhole depth increases is 40% (surface regime) and 70% (bed-surface regime) that of the bed regime. (Miller-PTT)

Group 8B—Hydraulics

Mathematical models, Sedimentation, Taw Estuary.

Bedforms are a common feature of sand-bedded rivers, estuaries and open sea areas. In addition to small-scale ripples, larger sandwaves (dunes) are found in most areas of strong sediment transport. A numerical model was used to determine changes in the bed morphology resulting from the bed load and suspended transport of sand. The ability of the model to predict mean and turbulent quantities and the suspended transport of sand was assessed by laboratory flume experiments and field observations. The model was then applied to investigate changes that may be expected to occur in an initial bedform corresponding to asymmetrical sandwaves characteristic of those found in the coastal and estuarine environment. It was found that suspended transport may frequently dominate over bed load transport in producing changes in the bedform structure. The predicted evolution of the bedform was consistent with observations made of sediment fluxes and sandwave migration in the Taw Estuary, England. (Author's abstract)

BEARSPAW DEVELOPMENT: DESIGN AND CONSTRUCTION OF A SIDE-CHANNEL OVERFLOW SPILLWAY.
M. Pildysh, R. J. Slopek, J. O. H. Nunn, and R. A. Keys.
Canadian Journal of Civil Engineering CJCEB8, Vol. 17, No. 3, p 423-430, June 1990. 7 fig, 1 ref.

Descriptors: *Alberta, *Dams, *Flood control, *Overflow channels, *Spillways, *Weirs, Channel improvement, Earth dams, Engineering, Erosion control, Flood-control storage, Heaving, Hydraulic engineering, Model studies, Reinforced concrete, Spillway gates.

An emergency spillway with a capacity of 1840 cu m/s has been built to increase the spillway capacity of the 30-year-old Bearspaw Development so that it can safely pass the probable maximum flood. A unique aspect of the free-overflow, side-channel emergency spillway is the weir. This consists of an earthfill dike with a cap and downstream facing of reinforced concrete. Comprehensive hydraulic model testing was undertaken to provide detailed design data and optimize the design of the emergency spillway. The overflow weir substructure is a zoned earthfill dike with a 2 mm thick polyethylene membrane at the top of the impervious core to prevent frost heave of the concrete lining. The reinforced concrete lining of the spillway is required for erosion protection and is designed to withstand the hydrodynamic drag and uplift forces caused by flowing water as well as piezometric uplift pressures due to seepage. An extensive underdrainage system was installed to reduce uplift pressures under the lining. An unlined return channel excavated through overburden and rock conducts spillway discharges back to the river. The Bearspaw Development side-channel spillway provides an example of design and construction of a major free-overflow spillway founded on a low-cost earthfill substructure. The overflow spillway, which was more economical and reliable than a conventional gated structure, was made technically and economically feasible through detailed engineering and extensive model testing. Conventional construction procedures were utilized to build an unconventional structure. (Agostine-PTT)

POSSIBILITIES OF CONSTRUCTING HYDROELECTRIC STATIONS: PUMPED STORAGE STATIONS IN ARMENIA.
V. B. Rostomyan, and G. A. Burnachyan.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 704-706, June 1990. 1 fig, 2 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 28-29, December 1989.

Descriptors: *Armenia, *Economic evaluation, *Hydroelectric plants, *Pumped storage, Electric power costs, Electric power demand, Electric power production, Hydroelectric power, Pumping head, Reservoir operation, USSR.

Pumped storage stations (PSSs), because of their flexibility in producing electric power at particular times, are necessary to meet the peak loads of modern power systems. The increasing electric power requirements of the Armenian republic, the increasing proportion of thermal electric power plants, the decrease in flexible capacity at existing hydroelectric stations (HESs) and the presence of favorable natural conditions indicated the need to introduce PSSs into the Armenian power system. This can be accomplished successfully and economically by reconstructing certain HESs of the Sevan-Razdan and Vorotan cascades. The Gyumush HES with a head of 285 m, discharge of 90 cu m/s, and installed capacity of 224 MW, the third step of the cascade, is the most powerful HES of the system and the most favorable for conversion to a HES-PSS operating regime. A discharge equal to 41 cu m/s will be used at the HES, which will provide a capacity of 102 MW. A capacity equal to 122 MW remains free. The volume of water required during the off-peak period of the load curve can be delivered by pumps from the lower pool of the existing HES during 7 h. The PSS will be located between the daily storage and the reservoir, with two reversible units: the turbine regime design discharge is 49 cu m/s with a 80 m head and a 38 MW capacity while the pump regime design discharge is 21 cu m/s with a head of 100 m and a capacity of 25 MW. Some 530,000 cubic m of water from the lower pool of the Gyumush HES will be delivered to the daily storage and further to the upper storage reservoir by a pump station constructed next to the HES. The pump station parameters are for a discharge of 21 cu m/s, a 295 m head and a 75 MW capacity. The daily energy for filling and discharging the PSS for a pure storage cycle is 480 MW. According to preliminary calculations, the unit investments in reconstructing the existing HES into a HES-PSS are 95 rubles/kW. The second and fifth steps of the cascade, the Atarbekyan and Kanaker HESs can also be transformed into HES-PSS by creating a daily storage at the end of the diversion canal of the second stage, deepening the daily storage of the fifth step, and constructing pump stations next to the powerhouses of the indicated stations. PECULIARITIES OF THE FORMATION OF BOTTOM DEPOSITS IN A CLOSED-COOLING POND.
B. I. Novikov, and N. A. Chizhmakova.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 730-733, June 1990. 1 fig, 1 tab, 3 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 49-51, December 1989.

Descriptors: *Bottom sediments, *Cooling ponds, *Electric powerplants, *Sediment distribution, *Sedimentation, Artificial ponds, Bottom sampling, Hydrodynamics, Sediment analysis, Sediment transport, Suspended sediments.

The development of thermal and nuclear powerplants has resulted in an ever-increasing number of cooling ponds. The peculiarities of the process of bottom deposits deformation in a closed cooling pond were examined. The investigations were performed at two cooling ponds with level segments with depths of 5-6 m and closed trenches exceeding 10 m. The studies consisted in removing cores and individual samples from a network of stations uniformly disposed over the pool area. The basic characteristic of the formation of bottom sediments in closed cooling ponds is the predominant participation of indigenous materials in this process, which are products of the scouring of primary soils-submerged soils. It is precisely from these products that the silts of the troughs and the sections protected from hydrodynamic action are formed. Consequently, any substance, including any harmful ones, will ultimately be concentrated on the bottom of the above-indicated sections of the body. This concentration is especially pronounced for substances associated with suspensions. (Hoskin-PTT)

MECHANICAL EQUIPMENT OF THE TIKHOVSK HYDRO DEVELOPMENT ON THE KUBAN RIVER.
A. F. Levashova.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 10, p 569-572, April 1990. 2 fig, 6 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 10, p 12-14, October 1989.

Descriptors: *Fish management, *Fish passages, *Hydraulic equipment, *Hydroelectric plants, *Locks, *Soviet Union, Ecological effects, Fish guiding, Fish populations, Hydraulic gates, Irrigation water, Mechanical equipment.

The Tikhovsk (Soviet Union) hydro development on the Kuban River is located at the confluence of the Protoka River and the Kuban River. The hydro development is intended for irrigation purposes; the interests and requirements of the economy were taken into account when selecting the composition of the structures of the hydro development. Because great attention is being given to ecology and, in particular, to the reproduction and protection of fish, two fish locks are provided for at the Tikhovsk hydro development. In comparison with the navigation locks and overflow dam, the fish locks have the most complex and diverse mechanical equipment. Of the total mass of 2560 tons of mechanical equipment the fish locks accounts for 1130 tons. The upstream and downstream slotted gates form a working chamber in which the pools are isolated and the fish are examined and counted. Directly behind the upstream slotted gate is an icthyological platform. The fish locks in addition to their main function--forceful transport of fish from the lower to the upper pool--can serve as a natural laboratory for developing ways of attracting various fish species. When designing the mechanical equipment of the fish locks, past experience in operating such structures was used. (Fish-PTT)

EXPERIENCE IN OPERATING ECOLOGICALLY CLEAN TURBINES.
V. A. Lagutin, and G. P. Nekryachenko.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 10, p 584-586, April 1990. 1 tab. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 10, p 22-24, October 1989.

Descriptors: *Hydraulic engineering, *Hydraulic machinery, *Hydraulic turbines, *Hydroelectric plants, *Soviet Union, *Water pollution control, Ecological effects, Maintenance, Mechanical failure, Oil pollution.

The first turbine of the Cheboksary (Soviet Union) hydroelectric station that was put into operation has an oil-filled runner bushing; therefore, the possibility of oil entering the river in an amount specified by the standards of the manufacturer is possible. The other 17 turbines have water-filled bushings, and are ecologically clean. However, these turbines are mechanically unreliable; complete fai

ure of the crossbeams on six turbines occurred in 1982-1985. Strengthening of the crossbeam, increasing the gaps, and replacing the bushings did not increase the reliability of the turbines. The turbine bearing is distinguished by an extremely low reliability, due to insufficient rigidity of the bearing housing, disturbance of the threading in the supports, difficult self-adjustment of the segment, transmission of tangential alternating forces through the bolt leading to partial or complete separation of the supports, and difficult repairs on the bearing owing to the confined space. At the hydrostation a number of operations to strengthen the bearings had to be carried out. An interdepartmental conference was forced to acknowledge that ecologically clean turbines do not provide the necessary reliability and do not correspond to the requirements of the specifications. Despite the unsuccessful introduction of ecologically clean adjustable-blade turbines into operation, the return to oil-filled runners should be decisively rejected, since the advantages of ecologically clean equipment are too obvious. It is necessary to develop a turbine that satisfies all operating conditions. (Fish-PTT)

DESIGN OF CRANES FOR OPERATING GATES.
I. K. Kaplan.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 10, p 605-607, April 1990. 1 fig, 1 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 10, p 37-38, October 1989.

Descriptors: *Hydraulic design, *Hydraulic gates, *Hydraulic machinery, *Hydroelectric plants, Control systems, Mechanical failure, Safety, USSR.

Operation of hydraulic gates at hydroelectric stations may sometimes become difficult. When lifting a gate, it is possible for it to become wedged in the guideways of the groove, causing both overloading of the hoisting device and transmission of an increased pulling force from the hoisting device to the object being raised. It may also jam during lowering, whereupon the hoisting device continues to operate and sagging of the cable occurs, followed by a sudden drop of the gate with a jerk considerably exceeding the design load. A protection device for both the crane and the restrained load is needed. A device has been developed for controlling the hoisting mechanism for a gantry crane of the water intake and outlets of a hydroelectric station. Tests on a prototype at the hydrostation confirmed the performance of the device. The technical and economic indices are: (1) the possibility of changing the capacity of the hoisting mechanism allows reduction of the number (and weight) of mechanisms needed; (2) the possibility of crane overloading decreases due to the use of electrical and hydraulic apparatus; (3) operating safety on the crane increases, since the control apparatus is backed up in the device; and (4) if necessary, the device can be made as an independent drive of increased capacity with a small stroke for lifting the gate from the sill and with a reduced load lifting or lowering speed. Descriptors: *Energy sources, *Hydroelectric plants, *Water delivery, *Water resources management, *Water supply development, Available head, Dynamic programming, Hydraulic turbines, Hydroelectric power, Metropolitan water management, Model testing, Optimization, Pipes.

During the past few years many water districts have discovered that electricity generated by installing suitable hydroelectric power plants in water supply mains may now be cost-effective as an energy source. An optimization model has been developed for determining the optimal design capacities of a water delivery system integrating small hydropower plants. A discrete distance model of the transmission pipeline was solved by employing dynamic programming. The model determines the proper allocation of available pressure head to various potential hydropower sites along the supply main and determines the optimal pipe diameter. The practical value of the model was demonstrated in a supply system to serve four towns. The solution of the model gives the set of turbine capacities, pipe diameters, head allocation resulting in maximum net benefit for a given quantity of available water and demand, and the expected net benefits. MECHANICAL EQUIPMENT OF THE TASHLYK PUMPED-STORAGE HYDROELECTRIC STATION AND ALEKSANDROVKA HYDRO DEVELOPMENT OF THE SOUTHERN UKRAINE POWER COMPLEX.
Y. V. Maksimenko, and V. S. Nesterenko.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 617-620, 1990. 4 fig. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 6-7, November 1989.

Descriptors: *Dams, *Hydraulic gates, *Hydraulic machinery, *Hydroelectric plants, *Nuclear powerplants, *Soviet Union, *Turbines, Gates, Hydraulic design, Hydraulic structures, Hydroelectric power, Slide gates, Ukraine.

The Southern Ukraine power complex includes a nuclear power station and three hydro developments: Tashlyk, Aleksandrovka, and Konstantinovka. The Tashlyk hydro development is being created in a ravine located in the left-bank region of the Southern Bug River valley next to the upstream Konstantinovka hydro development. The Aleksandrovka hydro development will be constructed 15 km downstream. The general layout of the facilities of the power complex was determined mainly by the location of a nuclear power station on the left bank of the Tashlyk reservoir. The Tashlyk pumped-storage hydroelectric station (PSS) provides combined operation of all power complex reservoirs for cooling the circulating waters of the Southern Ukraine nuclear power station. Six reversible units and four turbine units will be installed at the Tashlyk PSS. The water intake of the Tashlyk PSS is equipped with two absolutely identical emergency-guard slide gates 8.0 meters in width, 12.2 meters in height, and 24.0 m in head. The gate consists of four sections interconnected by hooks. The Aleksandrovka hydro development will be used as a buffer in the Southern Ukraine power complex. It will consist of an eight-bay overflow dam and a low-head powerhouse with two units. The overflow dam is equipped with fixed wheel gates 16.0 meters in width, 14.5 meters in height and with a head of 14.1 meters. These gates will serve as the service gates. The gates consist of two sections interconnected by hooks. Slide gates are used as the emergency-guard gates for purposes of economy of the mass of the embedded parts and gates. (Korn-PTT)

Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 620-627, 1990. 4 fig, 2 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 8-12, November 1989.

Descriptors: *Dams, *Hydraulic equipment, *Hydraulic structures, *Hydroelectric plants, *Soviet Union, Bulkhead gates, Economic evaluation, Gates, Hydraulic design, Hydraulic gates, Hydroelectric power, Reservoirs, Slide gates, Turbines.

The Vilyui No. 3 hydroelectric station is the second step of the cascade of Vilyui hydroelectric stations and is located 140 km downstream from the Vilyui Nos. 1 and 2 hydroelectric station sites. The main elements of the Vilyui No. 3 hydrostation structures are the powerhouse combined with the bottom outlets, headwater and tailwater canals, earth-rock dam, and office-production building. The reservoir of the No. 3 hydrostation does not have a seasonal storage and the station will operate on the through-going flow from the Nos. 1 and 2 hydrostations. A thorough study of the project made it possible to unify elements of the set of mechanical equipment, which in turn led to an increase in its reliability, reduction of the time, labor intensity, and cost of manufacturing and installing the equipment. It also resulted in an improvement in the quality of manufacture and assembly as a result of the economically advantageous use of special assembly jigs. Eliminating the use of specially manufactured intake and draft tube bulkhead gates and emergency-guard gates of the bottom outlet saves 420,000 rubles and 450 tons of metal. In addition, a new design for the lining was used thereby reducing the amount of field welding and welding deformations in the structures. This eliminated labor-intensive manual operations on installing anchor rods on the assembled linings and thereby increased the factory readiness of the linings for assembly. In addition, the new lining design reduced the consumption of metal and the presence of cutoffs in the anchor ribs improved the concreting conditions. (Korn-PTT)

ANALYTICAL METHOD OF CALCULATING SLOPE STABILITY.
I. A. Maslov.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 675-683, June 1990. 5 fig, 1 tab, 2 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 9-14, December 1989.

Descriptors: *Analytical, *Dam construction, *Engineering geology, *Mathematical analysis, *Slope stability, *Soil mechanics, Mathematical equations, Mathematical studies, Shear stress, Soil engineering, Soil physics, Structural engineering.

Methods of calculating the stability of slopes of earth structures, based on an examination of sliding of a soil mass on a cylindrical surface and proceeding from the fact that the soil in the zone of this surface is in a limit state, are the most widespread in modern engineering practice. However, the conditions of equilibrium of the forces acting on the sliding mass are not fulfilled in most of these methods, reducing the accuracy of the solution obtained, sometimes quite substantially. An analytical method of calculating slope stability which satisfies the conditions of equilibrium and permits calculation without dividing the sliding mass into vertical elements is proposed. In addition to the assumption generally made in such problems concerning the presence on the failure surface of a limit state characterized by the Coulomb criterion , a likelihood law of distribution of normal stresses on the failure surface compatible with the conditions of equilibrium is assumed a priori. This makes the investigated problem definite and not too complex. Methods of calculating slope stability in which the equilibrium conditions are not fulfilled can be used only for preliminary calculations if there are no considerable horizontal loads. In this case, it is recommended to use Terzaghi's method, introducing a proposed correction factor to the frictional forces on the failure surface. In critical calculations it is necessary to use methods in which the equilibrium conditions are fulfilled. They give essentially the same results. (Hoskin-PTT)

CORRESPONDENCE OF THE SCHEME AND METHOD OF CALCULATING THE STABILITY FACTOR.
V. I. Istomin.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 689-693, June 1990. 3 fig, 5 tab, 6 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 17-20, December 1989.

Descriptors: *Mathematical analysis, *Shear stress, *Slope stability, *Soil physics, Mathematical equations, Mathematical studies, Sliding wedge, Soil engineering, Structural engineering.

Three variants of a problem involving a sliding wedge form for an earth slope were calculated using the inclined forces of interaction (IFI) method, and the methods of Chugaev, Krey and Terzaghi. For the calculation of Kc, the stability factor of the experiment, a calculation accuracy of $0.85\ Kp < Kc < Kp$, (Kp is the stability factor for the prototype) is guaranteed for $x <= 15$ degrees (x is angle between the lines of action of the resultants of the restraining and shearing forces) (the sliding wedge is separated from the slope by the sliding surface not having an ascending branch) for the Terzaghi method and its analoges, the Krey method and its analoges, and the IFI method. The same Kc accuracy is found for the Chugaev method for $x < 90$ degrees (the sliding wedge is separated from the slope by a sliding surface having an ascending branch, on the sliding surface the ratio of the angles of the internal friction should be $>= 1.1$). The ascending branch is the part of the sliding surface where the shear force is directed toward retaining the sliding wedge. (Hoskin-PTT)

BEHAVIOR OF SOIL UNDER A BRIEF DYNAMIC LOAD.
O. A. Orlova.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 638-648, 1990. 5 fig, 1 tab, 6 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 20-26, November 1989.

Descriptors: *Load distribution, *Load testing, *Shear stress, *Soil dynamics, *Soil mechanics, Distortional strain, Dynamic load, Elastic properties, Plasticity, Soil engineering, Soil physical properties, Soil strength, Strain measurement, Volumetric strain.

The behavior of an earth structure under a dynamic load is determined by its design and physical and mechanical characteristics of the materials composing it These characteristics in turn depend on the stress-strain state of the structure at the moment of the dynamic load start, as well as on the process of deformation of the soil under this load. An investigation was initiated in which both a cohesive and a noncohesive soil was placed under a combined stress state. The results of the investigation show that the damping coefficients both of cohesive and noncohesive soils do not depend on the soils state relative to the limit state almost up to loss of strength by the soil specimen. An increase of the initial lateral pressure and dry density of the noncohesive soil as well as a decrease of the moisture content of cohesive soil noticeably reduce the value of the damping coefficients. The shear moduli for small values of the initial lateral pressure under conditions of a combined stress state for cohesive soil depend on the level of the initial lateral pressure, while for the noncohesive soil it depends on the change in moisture content. Both volumetric strains and distortional strains under brief dynamic shear load and under conditions of a combined stress state are far less than the strains from an equal static load. The description of the soil deformation process as a result of a brief dynamic load shows the possibility of determining the nonlinear reaction of soil to this load by means of the linear acceleration method, if the system under consideration can be represented as a system with one degree of freedom. SEEPAGE IN EARTH DAMS IN TWO- AND THREE-DIMENSIONAL FORMULATIONS OF THE PROBLEM.
L. N. Rasskazov, N. A. Aniskin, V. G. Zhelankin, V. V. Melakhanov, and V. F. Korchevskii.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 648-656, 1990. 8 fig, 8 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 26-32, November 1989.

Descriptors: *Dams, *Finite element method, *Flow velocity, *Hydraulic models, *Hydraulic structures, *Seepage, *Soil mechanics, *Soviet Union, Fluid mechanics, Hydraulic properties, Permeability coefficient, Rapid excavation, Seepage gradient, Unconfined flow.

At present, problems of unconfined seepage flows are solved by hydraulic methods, since fluid mechanical solutions are complex and applicable to a limited class of problems. Three-dimensional regions do not have direct fluid mechanical solutions. The problem is complicated when dams being constructed by a directed blast are examined, since inhomogeneity and anisotropy of the soil and nonlinearity of the relation between the flow velocity and seepage gradient occurs. A method and program were developed for calculating nonlinear seepage in blast-formed dams, which makes it possible to obtain the solution of a three-dimensional problem for an inhomogeneous, anisotropic region of a complex geometric form under arbitrary boundary conditions. In a dam composed of material having a nonlinear law of seepage, the position of the surface of depression is higher than for the case when a linear (laminar) seepage law is used. Consideration of three-dimensionality when solving the problem of nonlinear seepage in a blast-formed dam with a height of 70 m showed that the seepage discharge was somewhat greater and the position of the surface of depression was higher than for the case of the two-dimensional problem. This eliminates the need for solving three-dimensional seepage problems for this structure class. (Korn-PTT)

CAUSES AND CHARACTER OF MOVEMENTS OF THE LOAMY SAND MORAINE IN THE FOUNDATION OF THE PLYAVINYAS HYDROELECTRIC STATION POWERHOUSE.
M. P. Leonov.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 11, p 657-660, 1990. 4 tab, 6 ref. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 11, p 33-35, November 1989.

Descriptors: *Foundation failure, *Foundation rocks, *Hydroelectric plants, *Loam, *Moraines, *Pipes, *Sand, *Soil erosion, *Soil mechanics, *Soviet Union, Erosion, Piping erosion, Soil dynamics, Soil physical properties, Soil properties, Soil stability.

The Plyavinyas hydroelectric station powerhouse, in operation since 1965, has a foundation composed of moraine loams and loamy sands characteristic of the ancient valley of the Daugava River. In the lower part of the strata weakly cemented sands and sandstones with infrequent thin interlayers of clay belonging to the Amata and Gauya suites occur. The zone of the Amata-Gauya rocks in the valley walls and floor in the immediate vicinity of the boundaries of the erosional incision, which after filling the valley with glacial deposits was in close contact with the moraine, was eroded by piping. Long-term operation of the drainage systems during construction and operation of the hydro development was accompanied by intensified removal of sand, which led to the revival of the process of piping erosion of the rocks under the base of the moraine. Loamy sand moraine movements in the foundation of the right-bank abutment of the powerhouse were most probably due to the caving in of large piping cavities in the underlying rocks. Taking into account the available data on the geological structure of the foundation and physical and geological processes occurring, the possibility of new loamy sand moraine movements in its right-bank is a possibility. Under the established conditions it is necessary to take urgent measures to limit the continuing piping erosion of the Amata-Gauya strata by removing sand through the vertical drain wells in the area near the station. The most radical solution would be maximum dispersal of water withdrawal by transferring the center of the discharge zone a greater distance from the powerhouse and complete cessation of the operation of nearby high-output wells. MONITORING HIGH CONCRETE DAMS DURING THEIR CONSTRUCTION AND SERVICE.
E. K. Aleksandrovskaya.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 708-714, June 1990. 2 fig, 10 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 33-37, December 1989.

Descriptors: *Concrete dams, *Dam construction, *Dam inspection, *Dam stability, Construction joints, Dam design, Dam failure, Data analysis, Mathematical analysis, Mathematical models, Model studies, Monitoring, Seepage, Soviet Union.

A comparison was made between observed and computed basic control parameter values in the construction and construction-service periods to evaluate the condition of the high arch-gravity dam at the Sayano-Shushenskoe hydroelectric plant. Measured and computed values were compared for four periods during the rise in the level of the headrace, which occurred in 1983, 1984, 1986 and 1987. An overall assessment of the dam's condition was made on the basis of the comparison between measured parameters and their computed values. The incomplete dam's profile, determined

from concrete elevations and computed for increments of hydrostatic pressure and the weight of concrete masonry, was adopted on the basis of conditions at the outset of the rise in headrace level for each of these periods during filling of the reservoir; temperature effects were disregarded. The comparison between the measured and computed values for three raceway sections indicated that the radial displacement from the computation for the first three ascents of the headrace level exceeded the measured values. In 1987, however, the computed displacements exceeded the measured by 440 m, while the measured values exceeded the computed in the lower portion of the dam. The arch stresses in the concrete at the maximum headrace level were identical with the computed values; several of them however, exceeded the computed values, especially in the keyed section of the dam. Continuous comparison between computed and measured arch stresses indicated that until a certain moment in 1987, the computed values exceeded the measured. Subsequently, the measured stresses exceeded the computed as the headrace level reached maximum (1986) elevations. During the second ascent of the headrace level from 500 to 532 m in 1988, the computed stresses again exceeded the measured. This suggested a more elastic stage of structure performance in 1988 as compared with the previous year. The noncorrespondences between the mathematical model and the prototype were due to the disregard of temperature effects on the dam and the opening of the contact joint, which was not precisely defined in the computations. During continuous service, the monitoring of high concrete dams should be performed by automated, computerized systems capable of determining discrepancies between computed and measured data. Hydrotechnical Construction HYCOAR, Vol. 23, No. 12, p 714-719, June 1990. 3 fig, 3 tab, 10 ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 12, p 37-41, December 1989.

Descriptors: *Concrete dams, *Construction joints, *Dam failure, *Dam stability, *Soviet Union, Bed load, Dam design, Dam inspection, Data analysis, Hydrologic properties, Hydrostatic pressure, Mathematical analysis, Mathematical models, Model studies.

The opening of the contact joint between the concrete and rock in the zone of the upstream face of the bed sections of the Sayano-Shushenskoe dam, first noted during the filling of the reservoir, has been continuously increasing. Monolithizing of the dam during its construction was repeated annually after seasonal drawdown of the reservoir in the winter-spring period. This has caused 'bridging' of the dam on the shoreline slopes and the appearance of an additional retaining moment, which prevented the tilting and deflection of the dam's channel sections. Two alternate schemes of computing the stress-strain state of the canyon were performed by the finite-element method, one assuming the dam is a monolithic body and one assuming it nonmonolithic. In the case of the monolithic dam, some of the load due to its own weight, including the channel sections, is taken up by the shoreline slopes. This causes a reduction in normal stresses at the concrete-rock contact in the region of the upstream face, especially in the bed sections adjacent to the shoreline slopes. Since the hydrostatic pressure on the bottom of the canyon causes corresponding bed deformations, conditions were created that contributed to separation of the bed from the dam and to opening of the contact joint. On the whole, seasonal warming apparently exerted a positive influence on the performance of the contact joint in the region of the upstream face. Seepage processes in the bed also exerted a major influence on the formation of the stress-strain state at the concrete-rock contact. Thus, a zone with tensile stresses, which does not completely disappear during seasonal drawdowns of the reservoir, exists at the concrete-rock contact in the region of the upstream face of the Sayano-Shushenskoe Dam. The condition of the dam is currently considered satisfactory, although a rise in the headrace level to the normal operating level, and also subsequent seasonal fillings and drawdowns of the reservoir may cause further opening of the joint and its associated deterioration of the structure's condition. CONCERNING THE PROBLEM OF ASSIGNING THE COMPOSITIONS OF STEEL FIBER-REINFORCED CONCRETES.
L. M. Deryugin.
Hydrotechnical Construction HYCOAR, Vol. 23, No. 10, p 608-611, April 1990. 2 fig, 3 tab. Translated from Gidrotekhnicheskoe Stroitelstvo, No. 10, p 38-41, October 1989.

Descriptors: *Concrete dams, *Concrete technology, *Dam construction, *Dam design, *Hydraulic design, *Hydroelectric plants, Concrete mixes, Materials engineering, Reinforced concrete, Sand, Soviet Union, Spillways.

Passage of the flood discharges of the Enisei River in the Soviet Union through the temporary spillway openings of the second level of the Sayano-Shushenskoe dam in 1980-1982 led to serious erosion of the concrete surfaces. Construction of the permanent spillways was approached from two fundamentally different aspects: the provision of a hydraulic regime safest from cavitation erosion; and the search for a material considerably more resistant to the effect of cavitation in order to create surfaces able to withstand high-velocity flow (55 m/s) on the permanent spillways. Steel fiber-reinforced concrete, which was successfully used for treating damages of the concrete at a hydro development in Pakistan, was examined as one of the possible variants. It was found that a considerable increase of the content of sand in comparison with ordinary concrete mixes is required for preparing workable fiber-reinforced concrete mixes. The optimal content of sand should be selected experimentally in relation to the particular properties of the aggregates and length, cross section, and content of fiber. Fiber can be regarded as a coarse aggregate of acicular form with a developed surface, for binding of which an increased quantity of the mortar component is necessary. When using fiber in the form of wire lengths without additional anchorage on the ends, its length can be taken equal to 60-65 diameters without a substantial decrease of the tensile strength of the fiber-reinforced concrete. A reduction in length of the fiber to these limits considerably decreases clumping of the fiber during mixing. (Fish-PTT)

Descriptors: *Cements, *Concrete technology, *Concrete testing, *Concretes, *Formwork, Ensonite, Hydraulic structures, Soviet Union, Water to cement ratio.

The face surface of formwork should have an absorbing layer to promote surface hardening of the concrete. A series of investigations were carried out to determine the effectiveness of absorbing formwork on concrete using water to cement ratios (W/C) of 0.365. The results of the investigation indicated that absorbing formwork has a substantial effect on concrete quality for concretes with W/C greater than or equal to 0.365. The concrete surface quality depends on the quality of the absorbing formwork materials used. The possible amount of water removed from the concrete by means of the absorbing (vacuum) formwork was 2.4-3.57 kg/sq m. Before the start of hardening of the concrete, its water content decreases by 20-30% at a depth to 15 cm from the absorbing formwork. During hardening of the concrete, its water content equalizes over the entire length of the specimen (thickness of the block), and under these conditions the W/C ratio of the concrete near the formwork is not more than 1% below the initial ratio. According to the results of concrete testing for cavitation resistance, the best indices were noted for formwork containing ensonite. In this case, the cavitation resistance of the concrete was increased up to 1.4 times. This circumstance permits the use of formwork absorbing material such as fine-porous paperboard of the ensonite type (with pore sizes 20-100 nm), which freely passes water molecules but retains cement particles. DAM RENOVATION: FROM INVESTIGATION TO REPAIR.
Bridgeport Hydraulic Co., CT.
E. M. Bernard.
Journal of the American Water Works Association JAWWA5, Vol. 82, No. 8, p 28-34, August 1990. 2 fig.

Descriptors: *Concrete technology, *Dams, *Maintenance, *Rehabilitation, Concrete dams, Connecticut, Gravity dams, Leakage.

Bridgeport Hydraulic Company (BHC) in southwestern Connecticut has undertaken a comprehensive renovation program to identify and schedule necessary repairs to each of its 21 concrete gravity dams, all of which were built in the early part of this century. Renovation efforts at two BHC dams (Easton Dam and Means Brook Dam) from initial investigatory work to final design and construction are described. Although both projects involved concrete gravity dams that were constructed during the same period and exhibited similar freeze-thaw damage, distinctly different repair approaches were formulated. In the case of Easton Dam, repairs made to control leakage through the dam were undertaken because of the amount of leakage and repairs of the concrete surfaces were split into separate renovation projects for the crest and the downstream surface because of the size of the dam. Cast-in-place concrete was employed for the crest, whereas the method to be used for the downstream surface remains undecided. At Means Brook Dam, leakage control repairs were deemed unnecessary; repairs of the concrete surfaces will be undertaken with cast-in-place concrete for the crest and precast panels for the downstream surface. Factors that affect the renovation approach of any dam are reviewed. (Agostine-PTT)

General industrial sensors are presently finding wide use at hydroelectric stations for measuring the pool levels and head. Milliammeters are used as the direct reading instruments. These milliammeters and indicating instruments have a low resolution and do not always meet the accuracy requirements imposed on readings. It is suggested that digital voltmeters be used instead as indicating instruments, however it is necessary to install a matching device at the input of the digital voltmeters for interfacing with the output signal of the sensor. The reference voltage is fed to the voltage divider. A voltage proportional to the minimum or maximum value of the elevation of the pool level is set by potentiometers. The algebraic sum of the voltages is fed to the input of the digital voltmeter for displaying the value of the present parameter. Measuring systems which use digital voltmeters have been operating for several years at a number of hydrostations in the Soviet Union, their operation has been reliable. The introduction of digital voltmeters as indicating instruments in circuits measuring the pool levels and head make it possible to have convenient information providing accurate readings of the parameters of interest. TEMPERATURE SELECTION BY STRIPED BASS IN A GULF OF MEXICO COASTAL RIVER SYSTEM.
Georgia Cooperative Wildlife Research Unit, Athens.
M. J. Van Den Avyle, and J. W. Evans.
North American Journal of Fisheries Management NAJMDP, Vol. 10, No. 1, p 58-66, Winter 1990. 3 fig, 3 tab, 21 ref. U.S. Fish and Wildlife Service Project AFS-13.

Descriptors: *Fish behavior, *Gulf of Mexico, *Striped bass, *Temperature effects, Apalachicola River, Fish populations, Monitoring, Seasonal variation, Telemetry.

Behavior of adult striped bass Morone saxatilis in the Flint River-Lake Seminole portion of the Apalachicola River system was evaluated to determine if temperature preferences differed from those of striped bass from Atlantic coast stocks. Radiotelemetry was used to monitor fish distribution and temperature selection from March 1984 to November 1985. Seasonal distribution patterns and influences of water temperature on striped bass behavior were similar to those reported elsewhere for Atlantic striped bass. The fish ranged widely and occurred throughout the 166-km-long study area during fall, winter, and spring. During summer, however, they inhabited spring-fed areas almost exclusively. The fish moved into these sites during May, when surrounding waters averaged 24.3 C, and remained there through late October or early November, when ambient water temperatures declined to an average of 20.1 C. Temperatures selected by the fish averaged 21.6 C during both summers. When the data were separated into subsets of native Gulf and introduced Atlantic striped bass by the use of previously reported meristic characteristics, there were no differences between groups for average temperatures selected during summer or for temperatures at which the fish moved into or out of springs. The results indicated that preferred temperatures of striped bass in the Apalochicola River are not higher than those of other stocks. (Author's abstract)

EFFECT OF HARDNESS AND SALINITY ON SURVIVAL OF STRIPED BASS LARVAE.
Maryland Univ. at Baltimore. Dept. of Pathology.
A. S. Kane, R. O. Bennett, and E. B. May.
North American Journal of Fisheries Management NAJMDP, Vol. 10, No. 1, p 67-71, Winter 1990. 2 fig, 1 tab, 22 ref.

Descriptors: *Bioassay, *Fish hatcheries, *Fish larvae, *Hardness, *Salinity, *Striped bass, *Survival, Calcium carbonate, Chemical properties, Fish physiology, Sodium chloride.

Larval striped bass Morone saxatilis were exposed to three hardness concentrations (40, 100, and 160 mg/L as CaCO3 equivalents) and two NaCl salinities (2.0 and 3.0 ppt) treatments for 10 d in a modified flow-through system. Salinity had a greater effect on larval survival than did hardness over the ranges tested. Elevated NaCl salinity appeared to by detrimental; larvae exposed to 3.0 ppt NaCl had significantly higher mortality than did those exposed to 2.0 ppt NaCl. At 2.0 ppt salinity, hardness does not appear to play an important role in larval survival (probability of survival > 0.70). At 3.0 ppt salinity, mortality was greatest at hardness levels of 40 and 100 mg/L (probability of survival = 0.06 and 0.01, respectively), whereas at 160 mg/L, mortality was reduced (probability of survival = 0.39). The reason for this response is not clear, although there may be an optimal ratio of different ions contributing to total salinity. By comparison, other studies in which diluted seawater was used indicated that salinities of 0.5-10.0 ppt enhance the survival of striped bass larvae. (Author's abstract)

RELATIONS BETWEEN BROOK TROUT STANDING STOCKS AND HABITAT FEATURES IN BEAVER PONDS IN SOUTHEASTERN WYOMING.
Wyoming Cooperative Fishery and Wildlife Research Unit, Laramie.
P. L. Winkle, W. A. Hubert, and F. J. Rahel.
North American Journal of Fisheries Management NAJMDP, Vol. 10, No. 1, p 72-79, Winter 1990. 1 fig, 7 tab, 25 ref.

Descriptors: *Aquatic habitats, *Beaver ponds, *Brook trout, *Fish populations, *Limnology, *Wyoming, Dissolved solids, Elevation, Regression analysis, Standing stock, Water depth.

Relations between abundance of brook trout Salvelinus fontinalis and habitat features of ponds made by beavers Castor canadensis were determined in 1986 and 1987 from observations of 25 southeastern Wyoming ponds. Standing stocks of fish longer than 100 mm in total length ranged from 5 to 313 kg/hectare, and densities ranged from 27 to 9,812 fish/hectare among 0.02-0.51-hectare ponds at elevations from 2,341 to 2,969 m above mean sea level. Of 25 habitat features, 6 were correlated with brook trout standing stock or density; surface area, mean water depth, water volume, discharge into pond, elevation, and morphoedaphic index (total dissolved solids (mg/L)/mean depth (cm)). The presence of young-of-year brook trout in beaver ponds was also related to both standing stock and density of brook trout longer than 100 mm in total length. Two multiple-regression models based on a rating of natural recruitment potential and pond surface area accounted for significant variation in brook trout standing stocks (adjusted R sq = 0.42) and densities (adjusted R sq = 0.50). The models provide a potential tool for assessment of beaver ponds as habitat for brook trout in southeastern Wyoming. (Author's abstract)

A hydrometeorological model of stream temperature was calibrated to two southern Ontario streams the Rouge and Humber Rivers, in the summer to estimate potential reductions, due to climatic warming, of thermal habitat for brook trout Salvelinus fontinalis. Summer habitat for brook trout in both streams, determined from electrofishing surveys during 1987 and 1988, was delimited downstream by a thermal barrier of about 24 C. Tagging data for one stream suggested that brook trout moved upstream to summer habitat as water temperatures in downstream areas increased during spring and summer. To estimate upstream movement of the thermal habitat barriers and concomitant reductions in summer habitat for brook trout due to climatic warming, the calibrated stream models were forced with the changes in mean July and August air temperatures (increase, 4.1 C) projected for the region by the climate warming scenario of the Goddard Institute for Space Studies. The temperature of groundwater discharging to the streams by the projected change in mean annual air temperature (increase, 4.8 C) was also adjusted. Elevated air and groundwater temperatures increased maximum summer stream temperatures and moved the thermal habitat barriers upstream, which reduced summer thermal habitat for brook trout in the two streams by 42 and 30%. However, because groundwater temperatures will always be lower than summer air temperatures, the cooling function of groundwater in streams will be maintained. The fate of a stream population of brook trout in a 'warmer' climate will be determined by the volume of groundwater discharging to the stream and the space available to which the fish can retreat in summer. SIZE-DEPENDENT WINTER MORTALITY OF YOUNG-OF-THE-YEAR WHITE PERCH: CLIMATE WARMING AND INVASION OF THE LAURENTIAN GREAT LAKES.
York Univ., Toronto (Ontario). Dept. of Biology.
T. B. Johnson, and D. O. Evans.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 301-313, March 1990.

7 fig, 4 tab, 58 ref.

Descriptors: *Climatic changes, *Climatology, *Fish populations, *Global warming, *Great Lakes, *Introduced species, *Limnology, *Perch, *Temperature effects, Age classes, Body size, Distribution, Foods, Mortality, Seasonal variation, White perch.

White perch Morone americana invaded Lake Ontario about 1946 and are now found in Lakes Erie, St. Clair, and Huron, and in Green Bay, Lake Michigan. The indigenous marine distribution of white perch along the Atlantic coast of North America and an analysis of climatological data suggest that the northern Gulf of St. Lawrence in the vicinity of the Gaspe Peninsula is too cold to permit white perch to establish local populations or to invade the Great Lakes via the St. Lawrence River. High mortalities of white perch have occurred in Lake Ontario during very cold winters, further suggesting that distribution of white perch is limited by low tolerance of cold temperature. Warmer-than-average summer and winter temperatures during the late 1940s coincided with the invasion of white perch into the Great Lakes via transportation canals in the state of New York. Tolerance of young-of-the-year white perch for low temperature was tested in the laboratory in overwinter experiments at constant temperatures of 2.5 and 4.0 C. Winter mortality was strongly influenced by body size, winter duration, temperature, and food availability. At 4.0 C, mortality was high for the smallest fish when food was withheld, but no mortality occurred under ad libitum feeding. The observed mortality for starved fish held at 4.0 C for 180 d was 40.6%. At 2.5 C, observed mortality was much higher than at 4.0 C and body size and winter duration continued to have strong effects. The results suggest that continued climate warming due to the 'greenhouse effect' would lead to improved recruitment and expansion of the range of white perch in the Great Lakes, because growth and size of young-of-the-year would be enhanced by longer growing seasons and winters would be shorter and less severe. CLIMATE CHANGE AND FISH COMMUNITIES: A CONCEPTUAL FRAMEWORK.
Alberta Univ., Edmonton. Dept. of Zoology.
W. M. Tonn.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 337-352, March 1990. 2 fig, 4 tab, 98 ref, append.

Descriptors: *Climatic changes, *Ecosystems, *Fish populations, *Fisheries management, *Global warming, *Temperature effects, Community structure, Distribution, Habitats, Lakes, Species composition.

Many autecological effects of temperature on fish are known, and fishery biologists have begun to incorporate this knowledge into population-level relations that can be used to assess possible effects of climatic warming on fishes and their habitats. However, the problem of extrapolating these or other relations to multispecies assemblages is not straightforward, given the complexity of community-level phenomena. A conceptual framework that views fish assemblages as products of a series of filters, operating at different spatial and temporal scales, through which an assemblage's component species must pass is presented. This framework can facilitate an understanding of the processes that organize fish assemblages and suggest ways in which the complex problem can be divided into manageable pieces. This framework is applied to an examination of small-lake fish assemblages in three regions on two continents. The procedure reveals local and regional relations of richness and composition and highlights the importance of isolation, extinction, and colonization, as well as temperature, that must be considered in climate change assessments. This community-level framework can organize accumulated knowledge of fish assemblages, identify causal processes behind community-level patterns, and focus research needed for the management of fish assemblages in the face of major anticipated changes in climate. IMPLICATIONS OF CLIMATE CHANGE FOR FISHERIES MANAGEMENT POLICY.
Department of Fisheries and Oceans, Nanaimo (British Columbia). Pacific Biological Station.
M. C. Healey.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 366-373, March 1990. 3 fig, 37 ref.

Descriptors: *Climatic changes, *Environmental policy, *Fisheries management, *Global warming, *Policy making, Adaptation, Equilibrium models, Prediction, Remedial policies.

It is now generally agreed that world climate will warm significantly over the next half century, but the effects of that warming on fishery resources are uncertain. Unpredictable changes in biological systems that result from perturbations such as climatic warming can be classified into four types: (1) changes that are consistent with current equilibrium models (predictions); (2) high-frequency, short-lived changes that cannot be predicted by current models (noise); (3) low-frequency, short-lived changes that cannot be predicted by current models (anomalies); and (4) low-frequency, long-lived changes that cannot be predicted by current models (catastrophes). Climatic change is a gradual process and the responses of biological systems are generally expected to be of the first type. However, increases in both the frequency and amplitude of the other types of response cannot be ruled out. The typical, incremental, remedial policy adjustment of governments and agencies is unsuited to uncertain changes in fishery resource dynamics of types 2-4, particularly those of type 4. An emphasis on mitigating the effects of climatic change is also likely to be unsuccessful because it focuses on the status quo and ignores opportunities that may be inherent in the changes taking place. Bolder policies that involve adaptation to new climate conditions and experimental probing of system behavior are more likely successful. (Author's abstract)

REDD SITE SELECTION BY BROWN TROUT IN DOUGLAS CREEK, WYOMING.
Wyoming Cooperative Fishery and Wildlife Research Unit, Laramie.
R. T. Grost, W. A. Hubert, and T. A. Wesche.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 365-371, June 1990. 3 fig, 2 tab, 13 ref.

Descriptors: *Douglas Creek, *Fish behavior, *Mountain streams, *Trout, *Wyoming, Aquatic habitats, Fish populations, Habitats, Spawning, Water depth.

The surface features of brown trout redds constructed by a resident population in Douglas Creek (a moderate-sized stream in the central Rocky Mountains) were studied and compared to measurements reported in the literature. The specific objectives were to describe spawning habitat used (water depth, water velocity, and substrate type) by brown trout and to assess selection for spawning habitat features. Average redd length was 147 cm, water depth 16 cm, and water velocity 34 cm/s, but variation was substantial. Brown trout selected water depths of 12-18 cm and velocities of 24-37 cm/s and avoided depths less than 6 cm and velocities less than 12 cm/s. Water depths and velocities measures over redds in 1987 and 1988 were similar to those measured in 1975 despite a 50-100% increase in the minimum flow during the 1987 and 1988 spawning periods. ABUNDANCE OF SPAWNING PACIFIC SALMON IN TWO LAKE SUPERIOR STREAMS, 1981-1987.
Department of Fisheries and Oceans, Sault Ste. Marie (Ontario). Great Lakes Lab. for Fisheries and Aquatic Sciences.
J. R. Kelso, and D. B. Noltie.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 209-215, 1990. 4 tab, 28 ref.

Descriptors: *Dam effects, *Fish migration, *Fish passages, *Lake Superior, *Salmon, Fish populations, Spawning.

Mark and recapture procedures were used to examine the abundance of Pacific salmon entering two Lake Superior tributaries to spawn between 1981 and 1987. In 1987, abundance of pink salmon in the Carp and Pancake rivers declined to 50 and 25%, respectively, of that observed in 1981. In contrast, abundance estimates and catch records indicated that coho and chinook salmon had increased since 1981. The construction of a lowhead barrier dam on the Carp River in 1983/84 allowed passage of coho and chinook but precluded passage by pink salmon. Construction of the barrier dam did not appear to be the major cause for changes in abundances of pink salmon. Most mature pink salmon (> 50% of total abundance) entered the spawning streams during a two-week period following either onshore wind or a heavy rainfall. It is premature to suggest a lake-wide decline in pink salmon abundance. (Author's abstract)

Descriptors: *Automation, *Computer programs, *Publications, Page layout, Software.

In 1987, the Water Resources Division of the U.S. Geological Survey undertook three pilot projects to evaluate electronic report processing systems as a means to improve the quality and timeliness of reports pertaining to water resources investigations. The three projects selected for study included the use of the following configuration of software and hardware: Ventura Publisher software on an IBM model AT personal computer, PageMaker software on a Macintosh computer, and FrameMaker software on a Sun Microsystems workstation. The following assessment criteria were to be addressed in the pilot studies: The combined use of text, tables, and graphics; analysis of time; ease of learning; compatibility with the existing minicomputer system; and technical limitations. It was considered essential that the camera-ready copy produced be in a format suitable for publication. Visual improvement alone was not a consideration. This report consolidates and summarizes the findings of the electronic report processing pilot projects. Text and table files originating on the existing minicomputer system were successfully transformed to the electronic report processing systems in American Standard Code for Information Interchange (ASCII) format. Graphics prepared using a proprietary graphics software package were transferred to all the electronic report processing software through the use of Computer Graphic Metafiles. Graphics from other sources were entered into the systems by scanning paper images. Comparative analysis of time needed to process text and tables by the electronic report processing systems and by conventional methods indicated that, although more time is invested in creating the original page composition for an electronically processed report, substantial time is saved in producing subsequent reports because the format can be stored and re-used by electronic means as a template. Because of the more compact page layouts, costs of printing the reports were 15% to 25% less than costs of printing the reports prepared by conventional methods. Because the largest report workload in the offices conducting water resources investigations is preparation of Water-Resources Investigations Reports, Open-File Reports, and annual State Data Reports, the pilot studies only involved these projects. Acid Precipitation Monitoring and Research. Review of Current Norwegian Activities.
W91-01888 5G

Atmospheric Input of Inorganic Nitrogen Species to the Kiel Bight.
W91-01921 5B

Groundwater Treatment with Zero Air Emissions.
W91-01946 5G

Risk Assessment of Drinking Water in a Reservoir Contaminated by PAHs Originated from Road Traffic.
W91-01991 5C

Multiresidue Method by High Performance Liquid Chromatography-based Fractionation and Gas Chromatographic Determination of Trace Levels of Pesticides in Air and Water.
W91-02038 5A

AIR POLLUTION EFFECTS
Relationships Among Depth to Frozen Soil, Soil Wetness, and Vegetation Type and Biomass in Tundra Near Bethel, Alaska, U.S.A.
W91-01369 5C

Relations Between Acid Rain and Vesicular-Arbuscular Mycorrhiza.
W91-01410 5C

Zinc in Poor Sandy Soils and Associated Groundwater. A Case Study.
W91-01450 5B

AIR POLLUTION SOURCES
Methane Emissions from Fen, Bog and Swamp Peatlands in Quebec.
W91-01719 5B

Rainwater Acidity at Jabiru, Australia, in the Wet Season of 1983/84.
W91-01818 5B

AIR TEMPERATURE
Global Climate Change: Implications for Air Temperature and Water Supply in Canada.
W91-01388 2B

Effect of Air Temperature on Growth of Largemouth Bass in North America.
W91-01396 2H

Relevance of the Microphysical and Radiative Properties of Cirrus Clouds to Climate and Climatic Feedback.
W91-01445 2B

Aircraft-based Radiometric Imaging of Tropospheric Temperature and Precipitation Using the 118.75-GHz Oxygen Resonance.
W91-01488 7B

Analysis of Air Temperature Effect of Taihu Lake (in Chinese).
W91-01577 2H

AIR-WATER INTERFACES
Gas Transfer Velocities in Lakes Measured with SF6.
W91-01412 2H

ALACHLOR
Aerobic and Anaerobic Degradation of Alachlor in Samples from a Surface-to Groundwater Profile.
W91-01019 5B

ALASKA
Relationships Among Depth to Frozen Soil, Soil Wetness, and Vegetation Type and Biomass in Tundra Near Bethel, Alaska, U.S.A.
W91-01369 5C

Permit Reform Through Coastal Consistency Preview: An Analysis of Alaska's Coordinated Process.
W91-01621 6F

Drilling Fluids and the Arctic Tundra of Alaska: Assessing Contamination of Wetlands Habitat and the Toxicity to Aquatic Invertebrates and Fish.
W91-01975 5B

ALBEDO
CO2 Climate Sensitivity and Snow-Sea-Ice Albedo Parameterization in an Atmospheric GCM Coupled to a Mixed-Layer Ocean Model.
W91-01694 5C

ALBERTA
Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Bearspaw Development: Design and Construction of a Side-Channel Overflow Spillway.
W91-01721 8B

Causes of Soil Salinization: 2. A Basin in East-Central Alberta, Canada.

ALDEHYDES
Chemistry of Carbonyl Compounds in Po Valley Fog Water.
W91-01451 5B

ALDICARB
Aldicarb Food Poisonings in California, 1985-1988: Toxicity Estimates for Humans.
W91-01052 5C

ALGAE
Algal Use of Sedimentary Phosphorus from an Amazon Floodplain Lake: Implications for Total Phosphorus Analysis in Turbid Waters.
W91-01047 2H

Investigation of the Metal-Algae Binding Site with 113-Cd Nuclear Magnetic Resonance.
W91-01060 5B

Bioaccumulation and Toxicity of Zinc in the Green Alga, Cladophora glomerata.
W91-01111 5C

Spirogyra Species and Accompanying Algae from Pools and Ditches in The Netherlands.
W91-01333 5C

Biosedimentology and Paleohydrology of Holocene Stromatolites from Lake Tanganyika (Biosedimentologie des Stromatolites Holocenes du lac Tanganyika (Burundi). Implications Hydrologiques).
W91-01372 2J

Colonization Process of a Typical Epilithic Algal Community--Homoeothrix janthina-Achnanthes japonica Community--in a Less Polluted River in Japan (in Japanese).
W91-01383 2H

Time Trend of PCB Concentrations in Surface Sediments from a Hypertrophic, Macroalgae Populated Area of the Lagoon of Venice.
W91-01448 5B

Growth of Bacteria on Organic Matter Produced by Algae in Continuous Cultures.
W91-01589 2H

Algal Exudation and Its Relation to Bacterial Production During Vernal Phytoplankton Blooms.
W91-01592 2H

Effects of Various Biophysicochemical Conditions on Toxigenicity of Vibrio cholerae 01 During Survival with a Green Alga, Rhizoclonium fontanum, in an Artificial Aquatic Environment.
W91-01801 2H

Distribution and Primary Productivity of the Epizoic Macroalga Boldia erythrosiphon (Rhodophyta) in a Small Alabama Stream.
W91-01805 2H

Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Effects of Herbivore Type and Density on Chemical Composition of Algal Assemblages in Laboratory Streams.
W91-01807 2H

Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

Fate and Effects of Pulp Mill Chlorophenolic 4,5,6-Trichloroguaiacol in a Model Brackish Water Ecosystem.
W91-01816 5B

Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

Effects of Short-term Pulses of Atrazine on Attached Algal Communities in a Small Stream.
W91-02040 5C

ALGAL BLOOMS
Is It Possible to Regain an Ecological Balance in a Lake With Blooms of Nuisance Microorganisms.
W91-01220 5C

Cyanobacterial Toxins in European Waters: Occurrence, Properties, Problems and Requirements.
W91-01221 5B

Algal Exudation and Its Relation to Bacterial Production During Vernal Phytoplankton Blooms.
W91-01592 2H

Substrate-Ectoenzyme Interaction: Significance of beta-Glucosidase Activity for Glucose Metabolism by Aquatic Bacteria.
W91-01597 2H

ALGAL GROWTH
Test of the Assumptions and Predictions of Recent Microalgal Growth Models with the Marine Phytoplankter Pavlova lutheri.
W91-01139 2L

Microalgal Growth Model.
W91-01140 2L

Eutrophication: Assessment, Research and Management with Special Reference to Scotland's Freshwaters.
W91-01277 5C

Algae, Other Than Diatoms, Affecting the Density, Species Richness and Diversity of Diatom Communities in Rivers.
W91-01765 2H

Distribution and Primary Productivity of the Epizoic Macroalga Boldia erythrosiphon (Rhodophyta) in a Small Alabama Stream.
W91-01805 2H

Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

Expression of Results from Growth Inhibition Toxicity Tests with Algae.
W91-02031 5C

ALGAL MORPHOLOGY
Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

ALGAL POPULATIONS
Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

ALGICIDES
Effect of Copper Sulfate on Hematology, Blood Chemistry, and Hepato-Somatic Index of an Indian Catfish, Heteropneustes fossilis (Block), and Its Recovery.
W91-01325 5C

Acute Toxicities and Hematological Effects of Two Substituted Naphthoquinones in Channel Catfish.
W91-01970 5C

ALGORITHMS
Algorithm for Retrieving Water Vapor Profiles in Clear and Cloudy Atmospheres from 183 GHz Radiometric Measurements: Simulation Studies.
W91-01474 7C

ALIPHATIC HYDROCARBONS
Paraffin Hydrocarbons in the Gonads of the Sea Urchin Strongylocentrotus nudus Normally and after Exposure to Diesel Oil (in Russian).
W91-01456 5B

Distribution of Hydrocarbon Concentrations from Urban Runoff.
W91-01998 5B

Application of Multivariate Analysis for Characterization of Organic Compounds from Urban Runoff.
W91-02004 5A

ALKALINITY
Contribution of Organic Acids to Alkalinity in Lakes Within the Mount St. Helens Blast Zone.
W91-01051 2H

Decomposition Rate, Chemical Composition and Nutrient Recycling of Nymphaea alba L. Floating Leaf Blade Detritus as Influenced by pH, Alkalinity and Aluminium in Laboratory Experiments.
W91-01332 2H

Epiphytic Zoobenthos Density and Biomass within Low Alkalinity, Oligotrophic Lakes on the Canadian Shield.
W91-01338 5C

ALKOXYRESORUFIN
Induction of Alkoxyresorufin Metabolism: A Potential Indicator of Environmental Contamination.
W91-01685 5C

ALKYLAMINES
Fate of Cationic Surfactants in the Marine Environment, II: Photooxidation of Long-Chain Alkylamines in Aqueous Media.
W91-01733 5B

ALKYLNITRILES
Fate of Cationic Surfactants in the Marine Environment: I. Bioconcentration of Long-Chain Alkylnitriles and Trialkylamines.
W91-01723 5B

ALLUVIAL AQUIFERS
Hydrology of the Powder River Alluvium Between Sussex, Wyoming, and Moorhead, Montana.
W91-01852 2F

ALLUVIAL CHANNELS
Development of Bed Features.
W91-01491 2J

Numerical Simulation of Gravel River Widening.
W91-01516 2J

Nonlinear Solution of Aggradation and Degradation in Channels.
W91-01668 2J

ALLUVIAL RIVERS
Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

ALTERNATIVE PLANNING
Reconnaissance-Level Alternative Optimal Ground-Water Use Strategies.
W91-01557 6D

ALUMINUM
Temporal Solubility Trends of Aluminum and Iron Leached from Coal Spoils and Contaminated Soil Materials.
W91-01007 5B

Geochronology for Polycyclic Aromatic Hydrocarbon Contamination in Sediments of the Saguenay Fjord.
W91-01183 5B

Micropollutants in Water Used for Renal Dialysis: An International Perspective.
W91-01227 5C

Acid Precipitation and Food Quality: Inhibition of Growth and Survival in Black Ducks and Mallards by Dietary Aluminum, Calcium, and Phosphorus.

Oxidation of Phenols in Water by Hydrogen Peroxide on Alumine Supported Iron (Oxydation des Phenols par le Peroxyde D'Hydrogene en Milieu Aqueux en Presence de fer Supporte sur Alumine).
W91-01418 2K

Release of Cationic Aluminium from Acidic Soils into Drainage Water and Relationships with Land Use.
W91-01479 5B

Soil and Soil Solution Chemical Composition at Three Sites within the Loch Dee Catchment, SW Scotland.
W91-01480 2K

Effects of Acidification on Leaf Decomposition in Streams.
W91-01803 5C

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Comparing the Effects of Acidic Deposition on the Chemistry of Small Streams in the South Island of New Zealand With Those in the Fichtelgebirge, F.R.G.
W91-01870 5B

Assessment of Aluminum Mobilization and Pathways in the Birkenes Catchment, Southern Norway.
W91-01893 5B

Aluminum Mobilization in Soil and Stream Waters at Three Norwegian Catchments with Different Acid Deposition and Site Characteristics.
W91-01895 5B

Interpretation of Metal Concentrations in Estuarine Sediments of Florida Using Aluminum as a Reference Element.
W91-01898 2L

AMAZON RIVER
Biogeochemistry of Carbon in the Amazon River.
W91-01039 5B

Algal Use of Sedimentary Phosphorus from an Amazon Floodplain Lake: Implications for Total Phosphorus Analysis in Turbid Waters.
W91-01047 2H

AMEBAS
Association of Shower Use with Legionnaires' Disease.
W91-01186 5B

Fate of Entamoeba histolytica During Sewage Treatment Using Anaerobic Digesters.
W91-01241 5D

AMERICIUM
Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

AMES TEST
Mutagenic Activity of Surface Waters Adjacent to a Nuclear Fuel Processing Facility.
W91-01972 5C

AMINO ACIDS
Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

Seasonal Changes in the Dissolved Free Amino Acid and DOC Concentrations in a Hypertrophic African Reservoir and Its Inflowing Rivers.
W91-01356 2H

Effects of Herbivore Type and Density on Chemical Composition of Algal Assemblages in Laboratory Streams.
W91-01807 2H

LIBRARY U. OF I. URBANA-CHAMPAIGN

AMINO ACIDS

Incorporation of Thymidine, Adenine and Leucine into Natural Bacterial Assemblages.
W91-01931 2L

Effect of Short-Term Exposure to Pentachlorophenol and Osmotic Stress on the Free Amino Acid Pool of the Freshwater Amphipod Gammarus pseudolimnaeus Bousfield.
W91-01967 5C

AMMONIA

Effects of Ammonia on Anaerobic Digestion of Simple Organic Substrates.
W91-01157 5D

Process Control Strategy for the Biological Reduction of Phosphorous and Ammonia Nitrogen Utilizing the A/O Process.
W91-01187 5D

Use of a Compartmental Model to Develop Rules for the Interpretation of Water Quality Data.
W91-01214 5B

AMMONIA REMOVAL

Economic Considerations in Wastewater Treatment with Duckweed for Effluent and Nitrogen Renovation.
W91-01176 5D

Performance of Lagoon Intermittent Sand Filter Systems.
W91-01177 5D

AMMONIFICATION

Estimation of Ammonification and Ammonium Assimilation in Surficial Coastal and Estuarine Sediments.
W91-01035 2L

AMMONIUM

Estimation of Ammonification and Ammonium Assimilation in Surficial Coastal and Estuarine Sediments.
W91-01035 2L

Rapid Ammonium Cycling and Concentration-Dependent Partitioning of Ammonium and Phosphate: Implications for Carbon Transfer in Planktonic Communities.
W91-01043 2H

Oceanic and Estuarine Ammonium Oxidation: Effects of Light.
W91-01046 2L

Role of Ammonium and Nitrate Retention in the Acidification of Lakes and Forested Catchments.
W91-01718 5B

AMPHIPODS

Toxicity of Fluoranthene in Sediment to Marine Amphipods: A Test of the Equilibrium Partitioning Approach to Sediment Quality Criteria.
W91-01265 5C

Chronic Toxicity and Bioaccumulation of 2,5,2',5'- and 3, 4, 3',4'-Tetrachlorobiphenyl and Aroclor 1242 in the Amphipod Hyalella azteca.
W91-02035 5C

ANAEROBIC BACTERIA

Reduction of Toxic Chromate in an Industrial Effluent by Use of a Chromate-Reducing Strain of Enterobacter Cloacae.
W91-01641 5D

ANAEROBIC DIGESTION

Influence of Immobilization Supports on Kinetic Constants of Anaerobic Purification of Olive Mill Wastewater.
W91-01055 5D

Start-Up in Anaerobic Treatment of Natural-Rubber Effluent.
W91-01056 5D

Effects of Ammonia on Anaerobic Digestion of Simple Organic Substrates.
W91-01157 5D

Fate of Entamoeba histolytica During Sewage Treatment Using Anaerobic Digesters.
W91-01241 5D

Anaerobic Digestion of Industrial and Agricultural Wastes.
W91-01245 5D

Fate of Selected Chlorinated Organic Compounds during Semi-Continuous Anaerobic Sludge Digestion.
W91-01319 5D

Anaerobic Treatment of Baker's Yeast Wastewater: II. Sulfate Removal.
W91-01322 5D

Start-Up of Low Temperature Anaerobic Reactors Using Freshwater Methanogenic Sediments.
W91-01637 5D

Glucose Induced Breakdown of Enhanced Biological Phosphate Removal.
W91-01639 5D

ANALYTICAL

Analytical Method of Calculating Slope Stability.
W91-01434 8D

ANALYTICAL METHODS

Nonpriority Analysis of the Wastewater Streams of Four Dye Manufacturing Facilities.
W91-01172 5A

Microorganisms in Marine Sediments: Considerations Concerning Activity Measurements.
W91-01585 2J

Improved Assessment of Bacterial Production: Combined Measurements of Protein Synthesis via Leucine and Cell Multiplication via Thymidine Incorporation.

BRAZIL
Variability of Mangrove Ecosystems Along the Brazilian Coast.
W91-01136 2L

Use of the Mussel Watch and Molecular Marker Concepts in Studies of Hydrocarbons in a Tropical Bay (Todos os Santos, Bahia, Brazil).
W91-01690 5A

Geoelectrical Investigation for Ground Water in Crystalline Terrains of Central Bahia, Brazil.
W91-01780 2F

BRINES
Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation: Part I. Evaluation of the Physical Properties of Highly Concentrated Brines.
W91-01757 3A

Use of Solar Ponds in the Disposal of Desalting Concentrate.
W91-01982 5E

Disposal of Concentrates from Brackish Water Desalting Plants by Means of Evaporation Technology.
W91-01983 5E

High Recovery Reverse Osmosis.
W91-01985 3A

BRITISH COLUMBIA
Identification, Characterization, and Hydrological Implications of Water Repellency in Mountain Soils, Southern British Columbia.
W91-01080 2G

Coastal Zone Management in British Columbia: An Institutional Comparison with Washington, Oregon, and California.
W91-01618 6E

Sphagnum-Dominated Peatlands of the Hyperoceanic British Columbia Coast: Patterns in Surface Water Chemistry and Vegetation.
W91-01692 2H

River Discharge and Tidal Controls on Salt-Wedge Position and Implications for Channel Shoaling: Fraser River, British Columbia.
W91-01722 2L

Observations on Overwintering Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) Exposed to Bleached Kraft Mill Effluent in the Upper Fraser River, British Columbia.
W91-01724 5B

BROMIDES
Atrazine and Bromide Movement through a Silt Loam Soil.
W91-01022 5B

BROOK TROUT
Relations Between Brook Trout Standing Stocks and Habitat Features in Beaver Ponds in Southeastern Wyoming.
W91-01387 8I

BRYOPHYTES
Accumulation of Scandium in the Shoots of Aquatic Bryophytes in Acid Water.
W91-01355 2H

BUFFERING
Buffering Capacity of Coal Mine Spoils and Fly Ash as a Factor in the Protection of the Aquatic Environment.
W91-01455 5G

BUILDING CODES
What Results when the Building Codes are not Observed.
W91-01550 8B

BULKING SLUDGE
Performance of Four Full-Scale Nitrifying Wastewater Treatment Plants Incorporating Selectors.
W91-01174 5D

Control of Sludge Settling Characteristics in the Single-Sludge System, A Hypothesis.
W91-01427 5D

Microbiology of Foaming in Activated Sludge Plants.
W91-01654 5D

BUOYS
Estimating the Variation of Buoy Wind and Wave Data Biases.
W91-01797 2H

BURKINA FASO
Changes in West African Savanna Agriculture in Response to Growing Population and Continuing Low Rainfall.
W91-01683 6D

CADAGUA RIVER
Relationship Between Water Quality and Caddisfly Assemblage Structure in Fast-Running Rivers. The River Cadagua Basin.
W91-01697 5A

CADDISFLIES
Associations of Aquatic Insects (Ephemeroptera, Plecoptera, and Trichoptera) in a Network of Subarctic Lakes and Streams in Quebec.
W91-01349 2H

Relationship Between Water Quality and Caddisfly Assemblage Structure in Fast-Running Rivers. The River Cadagua Basin.
W91-01697 5A

Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Effects of Herbivore Type and Density on Chemical Composition of Algal Assemblages in Laboratory Streams.
W91-01807 2H

CADMIUM
Investigation of the Metal-Algae Binding Site with 113-Cd Nuclear Magnetic Resonance.
W91-01060 5B

Cadmium Concentrations of Crustacean Zooplankton of Acidified and Nonacidified Canadian Shield Lakes.
W91-01062 5B

Immobilization Mechanisms in Solidification/Stabilization of Cd and Pb Salts Using Portland Cement Fixing Agents.
W91-01182 5G

Relative Sensitivities of Different Life Stages of Isognomon californicum to Cadmium Toxicity.
W91-01308 5C

Effects of Salinity, Temperature, and Cadmium on Cadmium-binding Protein in the Grass Shrimp, Palaemonetes pugio.
W91-01309 5B

Influence of Cadmium and Zinc on Cadmium Turnover in the Zebrafish, Brachydanio rerio.
W91-01310 5C

Effect of Cadmium on Vitellogenin Metabolism in Estradiol-Induced Flounder (Platichthys flesus (L.)) Males and Females.
W91-01365 5C

Effects of Water-Borne Cadmium on Plasma Cortisol and Glucose in the Cichlid Fish Oreochromis mossambicus.
W91-01777 5C

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

LIBRARY U. OF I. URBANA-CHAMP.

CADMIUM

Trends in the Heavy Metal Levels in the Dissolved and Particulate Phase in the Dutch Rhine-Meuse (Maas) Delta.
W91-01817 5B

Mercury, Cadmium and Lead in Eels and Roach: The Effects of Size, Season, and Locality on Metal Concentrations in Flesh and Liver.
W91-01821 5B

Mercury, Cadmium and Lead Concentrations in Five Species of Freshwater Fish from Eastern England.
W91-01822 5B

Transport of Heavy Metals Within a Small Urban Catchment.
W91-01992 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments I. The Limski Kanal (North Adriatic Sea).
W91-02009 5B

Behavior of Heavy Metals During Wastewater Treatment, I. Cadmium, Chromium and Copper.
W91-02012 5D

Effects of Cadmium on Murex trunculus from the Adriatic Sea: I. Accumulation of Metal and Binding to a Metallothionein-like Protein.
W91-02020 5B

Effects of Cadmium on Murex trunculus from the Adriatic Sea: II. Oxygen Consumption and Acclimation Effects.
W91-02021 5C

Effect of Waterborne and Dietary Cadmium on Plasma Ions of the Teleost Oreochromis mossambicus in Relation to Water Calcium Levels.
W91-02022 5C

Uptake and Elimination of Waterborne Cadmium by the Fish Noemacheilus barbatulus L. (Stone Loach).
W91-02023 5C

Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

CALCASIEU LAKE

Barotropic, Subtidal Exchange Between Calcasieu Lake and the Gulf of Mexico.
W91-01901 2H

CALCITE

Prediction of Phosphate Coprecipitation with Calcite in Freshwaters.
W91-01423 2H

CALCIUM

Acid Precipitation and Food Quality: Inhibition of Growth and Survival in Black Ducks and Mallards by Dietary Aluminum, Calcium, and Phosphorus.
W91-01320 5C

Study on Geochemistry and Geochemical Classification of Elements B, F, Rb and Sr in Yellow Sea (Huang Hai) Sediments.
W91-01566 2J

Effect of Waterborne and Dietary Cadmium on Plasma Ions of the Teleost Oreochromis mossambicus in Relation to Water Calcium Levels.
W91-02022 5C

CALIBRATIONS

Estimating the Variation of Buoy Wind and Wave Data Biases.
W91-01797 2H

CALIFORNIA

Outbreak of Pontiac Fever Due to Legionella anisa.
W91-01032 5C

Aldicarb Food Poisonings in California, 1985-1988: Toxicity Estimates for Humans.
W91-01052 5C

Mercury Speciation in Surface Freshwater Systems in California and Other Areas.
W91-01063 2K

In Re Water of Hallett Creek System.
W91-01120 6E

Removal of Organohalogens and Organohalogen Precursors in Reclaimed Wastewater--II.
W91-01416 5D

Coastal Zone Management in British Columbia: An Institutional Comparison with Washington, Oregon, and California.
W91-01618 6E

California v. FERC: State Regulation of Federal Hydropower.
W91-01629 6E

Californiazation of Arizona Water Politics.
W91-01631 6B

Analysis of Target and Nontarget Pollutants in Aqueous Leachates from the Hazardous Waste Site in Stringfellow, California, Via Ion Chromatography-Particle Beam and Inductively Coupled Plasma Mass Spectrometry.
W91-01728 5A

Water-Resources Data-Network Evaluation for Monterey County, California, Phase 3: Northern Salinas River Drainage Basin.
W91-01836 7A

Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

Use of Solar Ponds in the Disposal of Desalting Concentrate.
W91-01982 5E

Bioaccumulation of Selenium in Birds at Kesterson Reservoir, California.
W91-02029 5C

CALORIMETRY

Trace Gas Analysis Using Thermoanalytical Methods.
W91-01955 5A

CAMP LEJEUNE

Assessment of Hydrologic and Hydrogeologic Data at Camp Lejeune Marine Corps Base, North Carolina.
W91-01840 2F

CAMPYLOBACTER

Seasonal Variation of Thermophilic Campylobacters in Sewage Sludge.
W91-01655 5B

CANADA

Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

Triazine and Chloroacetamide Herbicides in Sydenham River Water and Municipal Drinking Water, Dresden, Ontario, Canada, 1981-1987.
W91-01306 5B

Epiphytic Zoobenthos Density and Biomass within Low Alkalinity, Oligotrophic Lakes on the Canadian Shield.
W91-01338 5C

Dissolved Organic Carbon Concentrations and Fluxes Along the Moisie River, Quebec.
W91-01341 2K

Global Climate Change: Implications for Air Temperature and Water Supply in Canada.
W91-01388 2B

Relationship Between Canadian Prairie Dry and Wet Months and Circulation Anomalies in the Mid-Troposphere.
W91-01429 2B

Precipitation and Environmental Conditions during Accretion in Canadian East Coast Winter Storms.
W91-01487 2B

Coastal Zone Management in British Columbia: An Institutional Comparison with Washington, Oregon, and California.
W91-01618 6E

Geographic Variation of Chlorinated Hydrocarbons in Burbot (Lota lota) from Remote Lakes and Rivers in Canada.
W91-02033 5B

Toxicological Examination of Whitefish (Coregonus clupeaformis) and Northern Pike (Esox lucius) Exposed to Uranium Mine Tailings.
W91-02037 5C

CANALS

Comparison of Historical and Recent Data on Hydrochemistry and Phytoplankton in the Rijnland Area (The Netherlands).
W91-01352 5B

Relationships Between Wetland Fragmentation and Recent Hydrologic Changes in a Deltaic Coast.
W91-01903 2L

CANCER

Ecological Correlation Between Arsenic Level in Well Water and Age-adjusted Mortality from Malignant Neoplasms.
W91-01292 5C

Fish Health and Environmental Health.
W91-01376 5C

CANOPY

Canopy Temperature as an Indicator of Differential Water Use and Yield Performance Among Wheat Cultivars.
W91-01407 3F

CAPILLARY CAPACITY

Relation Between Saturated Conductivity and Capillary Retention Characteristics.
W91-01303 2F

CARBARYL

Rapid Method for the Simultaneous Analysis o Chlorpyrifos, Isofenphos, Carbaryl, Iprodione and Triadimefon in Groundwater by Solid-Phas Extraction.
W91-01917 5A

CARBON CYCLE

Biogeochemistry of Carbon in the Amazo River.
W91-01039 5I

Distribution of Labile Dissolved Organi Carbon in Lake Michigan.
W91-01044 2I

Epilimnetic Carbon Flux and Turnover of Di ferent Particle Size Classes in Oligo-Mesotr phic Lake Lucerne, Switzerland.
W91-01335 5

Studies on the Decomposition of Lignocellulosic Carbon in a Flooded Ricefield Soil.
W91-01602 2H

Microbial Activities in a Naturally Acidotrophic Lake.
W91-01607 2H

CARBON DIOXIDE
Production and Carbon Isotopic Composition of Bacterial CO2 in Deep Coastal Plain Sediments of South Carolina.
W91-01297 2J

Measurement of CO2-Fixation in Sediments: Some Theoretical and Technical Aspects.
W91-01586 2J

CO2 Climate Sensitivity and Snow-Sea-Ice Albedo Parameterization in an Atmospheric GCM Coupled to a Mixed-Layer Ocean Model.
W91-01694 5C

Ground-Surface Delineation of Fractures Over Mined-Out Openings Using Carbon Dioxide Emissions.
W91-01787 5G

Effect of Pulp and Paper Mill Effluent Irrigation on Carbon Dioxide Evolution in Soils.
W91-01987 5E

CARBON ISOTOPES
Production and Carbon Isotopic Composition of Bacterial CO2 in Deep Coastal Plain Sediments of South Carolina.
W91-01297 2J

CARBONATES
Determination of the Origin of Suspended Matter and Sediments in the Elbe Estuary Using Natural Tracers.
W91-01132 2L

CARBONYL COMPOUNDS
Chemistry of Carbonyl Compounds in Po Valley Fog Water.
W91-01451 5B

CARBOXYLATION
Degradation of Phenol by a Bacterial Consortium Under Methanogenic Conditions.
W91-01773 5D

CARBOXYLIC ACIDS
Distribution of Short Chain Carboxylic Acids in Eutrophic Drainage Channels.
W91-01359 5B

CARCINOGENS
Risk Assessment of Drinking Water in a Reservoir Contaminated by PAHs Originated from Road Traffic.
W91-01991 5C

CARDIOVASCULAR DISEASE
Lack of Effect of Drinking Water Barium on Cardiovascular Risk Factors.
W91-01666 5F

CAROTENOIDS
Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

CARP
Effects of Pesticides on Some Biochemical Parameters of Carp (Cyprinus carpio L).
W91-01691 5C

Influence of pH on the Accumulation of Tri-N-Butyltin Chloride and Triphenyltin Chloride in Carp.
W91-01774 5B

CARPATHIAN MOUNTAINS
Variability and Dynamics of Leaching of the Flysch Carpathian Slope.
W91-01078 2G

CASE STUDIES
Importance of Natural Processes in Understanding Ecosystem Change: A Case Study of Limed Lakes.
W91-01073 2H

Irrigation with Membrane Plant Concentrate: Fort Myers Case Study.
W91-01981 3C

CATCHMENT AREAS
Theoretical Model of Optimal Drainage Networks.
W91-01526 2E

CATCHMENT BASINS
Blanket Peat Erosion in a Mid-Wales Catchment During Two Drought Years.
W91-01881 2J

Pollutant Removal by Gully Pots in Different Catchment Areas.
W91-02003 5D

CATFISH
Effect of Copper Sulfate on Hematology, Blood Chemistry, and Hepato-Somatic Index of an Indian Catfish, Heteropneustes fossilis (Block), and Its Recovery.
W91-01325 5C

Acute Toxicities and Hematological Effects of Two Substituted Naphthoquinones in Channel Catfish.
W91-01970 5C

Effects of Paraquat on Mortality and Cardiorespiratory Function of Catfish Fry Plecostomus commersoni.
W91-02032 5C

CATION EXCHANGE
Release of Cationic Aluminium from Acidic Soils into Drainage Water and Relationships with Land Use.
W91-01479 5B

CATIONIC SURFACTANTS
Fate of Cationic Surfactants in the Marine Environment: I. Bioconcentration of Long-Chain Alkylnitriles and Trialkylamines.
W91-01723 5B

Fate of Cationic Surfactants in the Marine Environment, II: Photooxidation of Long-Chain Alkylamines in Aqueous Media.
W91-01733 5B

CAVITATION
Local Energy Losses in Two-Component Pressure FLows.
W91-01648 8B

CELLULOSE
Studies on the Decomposition of Lignocellulosic Carbon in a Flooded Ricefield Soil.
W91-01602 2H

CEMENTS
Investigation of Concrete in Absorbing Formwork.
W91-01653 8F

CENTRAL AMERICA
Structure and Function of Dry Weather Mangroves on the Pacific Coast of Central America, with Emphasis on Avicennia bicolor Forests.
W91-01134 2L

CENTRIFUGATION
Simple Pore-Water Sampler for Coarse, Sandy Sediments of Low Porosity.
W91-01147 7B

CHANNEL ARMORING
Development of Armour in the Tambo River, Victoria, Australia.
W91-01880 2J

CHANNEL EROSION
Downstream of the Novosibirsk Hydroelectric Station on the Ob River.
W91-01544 4A

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

CHANNEL FLOW
Flow Stability and Friction Factor in Rough Channels.
W91-01494 8B

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

Influence of Debris Flows on Channels and Valley Floors in the Oregon Coast Range, U.S.A.
W91-01882 2J

CHANNEL MORPHOLOGY
Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

Flow and Particle Paths at a Natural River Confluence with Coarse Bed Material.
W91-01071 2J

Development of Bed Features.
W91-01491 2J

Three-Dimensional Computation of Flow and Bed Deformation.
W91-01493 2J

Changes in Stream Morphology and Storm Transport of Seston Following Watershed Disturbance.
W91-01505 2J

Numerical Simulation of Gravel River Widening.
W91-01516 2J

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

Modelling of Sandwave Evolution Resulting from Suspended and Bed Load Transport of Sediment.
W91-01675 8B

Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

Channel Avulsion and River Metamorphosis: The Case of the Thomson River, Victoria, Australia.
W91-01879 2E

Influence of Debris Flows on Channels and Valley Floors in the Oregon Coast Range, U.S.A.
W91-01882 2J

LIBRARY U. OF L. ENGINEERING

CHANNEL SCOUR
Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

CHANNELS
Determination of Designated Floodway Boundaries Around Long Islands in Stream Channels.
W91-01209 2E

River Discharge and Tidal Controls on Salt-Wedge Position and Implications for Channel Shoaling: Fraser River, British Columbia.
W91-01722 2L

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

Channel Avulsion and River Metamorphosis: The Case of the Thomson River, Victoria, Australia.
W91-01879 2E

CHECK STRUCTURES
Investigation into the Performance Characteristics of Boundary Boxes Subjected to Vertical Loading.
W91-01269 8B

CHEMICAL ANALYSIS
Toxicology of Chemical Mixtures: Experimental Approaches, Underlying Concepts, and Some Results.
W91-01075 5C

Simultaneous Dual Column, Dual-Detector Gas Chromatographic Determination of Chlorinated Pesticides and Polychlorinated Biphenyls in Environmental Samples.
W91-01281 5A

Chemistry of Dews and Frosts in Indianapolis, Indiana.
W91-01288 5B

Hailstones as Cloud Water Composition Probes: An Initial Assessment.
W91-01289 2K

Use of Tree-Ring Chemistry to Document Historical Ground-Water Contamination Events.
W91-01295 5B

Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

Application of the Isotope Dilution Principle to the Determination of Substrate Incorporation by Aquatic Bacteria.
W91-01599 2H

GC-MS Identification of Gaseous Volatiles in Wastewater.
W91-01696 5A

On-Line Continuous-Flow Extraction System in Liquid Chromatography with Ultraviolet and Mass Spectrometric Detection for the Determination of Selected Organic Pollutants.
W91-01711 5A

Automated Method for the Determination of Boron in Water by Flow-Injection Analysis with In-Line Preconcentration and Spectrophotometric Detection.
W91-01713 5A

Liquid Chromatographic Method with Fluorescence Detection for the Determination of Polycyclic Aromatic Hydrocarbons in Environmental Samples.
W91-01714 5A

Examination of the Range of Copper Complexing Ligands in Natural Waters Using a Combination of Cathodic Stripping Voltammetry and Computer Simulation.
W91-01715 5B

Speciation of Mercury Compounds in Waste Water by Microcolumn Liquid Chromatography Using a Preconcentration Column with Cold-Vapor Atomic Absorption Spectrometric Detection.
W91-01716 5A

Analysis of Target and Nontarget Pollutants in Aqueous Leachates from the Hazardous Waste Site in Stringfellow, California, Via Ion Chromatography-Particle Beam and Inductively Coupled Plasma Mass Spectrometry.
W91-01728 5A

Kinetic Study of the Decomposition of Methyl (1-(Butylcarbamoyl)-1H-benzimidazol-2-yl)carbamate (Benomyl) to Methyl 1H-Benzimidazol-2-ylcarbamate (MBC).
W91-01739 5B

Specific Chemical Composition of Karst Groundwater in the Ophiolite Belt of the Yugoslav Inner Dinarides: A Case for Covered Karst.
W91-01885 2F

Broad-Range Methods for Determination of Pollutants in Wastewater.
W91-01914 5A

Supercritical Fluid Extraction and Its Application to Environmental Analysis.
W91-01916 5A

Reversed-Phase Liquid Chromatographic Column Switching for the Trace-Level Determination of Polar Compounds. Application to Chloroallyl Alcohol in Ground Water.
W91-01918 5A

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

GC-FTIRS: Applications in Organic Trace Analysis.
W91-01956 5A

Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

Characterization of Compost with Respect to Its Content of Heavy Metals, Part I: Sample Digestion and ICP-AES Analysis.
W91-01986 5E

Influence of Complexing Agents and Surfactants on Metal Speciation Analysis in Road Runoff.
W91-01999 5A

CHEMICAL COMPOSITION
Chemical Composition of Bulk Precipitation Across the Mountains of Snowdonia, U.K.
W91-01820 2B

CHEMICAL INTERACTIONS
Abiotic Transformations of Iron and Phosphate in Humic Lake Water Revealed by Double-Isotope Labeling and Gel Filtration.
W91-01048 2H

CHEMICAL PROPERTIES
Prediction of Phosphate Coprecipitation with Calcite in Freshwaters.
W91-01423 2H

Association of Benzo(a)Pyrene with Dissolved Organic Matter: Prediction of K(dom) from Structural and Chemical Properties of the Organic Matter.
W91-01727 5B

CHEMICAL REACTIONS
Surface Ionization of Polynuclear Species in Al(1II) Hydrolysis--1. Titration Results.
W91-01413 5F

Surface Ionization of Polynuclear Species in Al(III) Hydrolysis--II. A Conditional Equilibrium Model.
W91-01414 5F

Oxidation of Phenols in Water by Hydrogen Peroxide on Alumine Supported Iron (Oxydation des Phenols par le Peroxyde D'Hydrogene en Milieu Aqueux en Presence de fer Supporte sur Alumine).
W91-01418 2K

CHEMICAL SPECIATION
Mercury Speciation in Surface Freshwater Systems in California and Other Areas.
W91-01063 2K

Chemical and Physical Speciation of Trace Metals in Fine Grained Overbank Flood Sediments in the Tyne Basin, North-East England.
W91-01082 5B

Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

Copper Toxicity to Paratya australiensis: II. Influence of Bicarbonate and Ionic Strength.
W91-01259 5C

Copper Toxicity to Paratya australiensis: III. Influence of Dissolved Organic Matter.
W91-01260 5C

CHEMICAL TREATMENT
Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

CHEMICAL WASTES
Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

CHEMISTRY OF PRECIPITATION
Precipitation Nutrient Inputs in Semiarid Environments.
W91-01030 2B

Hailstones as Cloud Water Composition Probes: An Initial Assessment.
W91-01289 2K

Most Dilute Lake in the World.
W91-01348 2H

Dry Deposition of Sulfur: a 23-Year Record fo the Hubbard Brook Forest Ecosystem.
W91-01411 5I

Comments on the Hydrochemical Regulation o the Halogen Elements in Rainfall, Stemflow Throughfall and Stream Waters at an Acidi Forested Area in Mid-Wales.
W91-01447 5I

Chemical Composition and Acidity of Rainfa in the Alligator Rivers Region, Northern Terr tory, Australia.
W91-01449 5

Chemistry of Carbonyl Compounds in Po Valle Fog Water.
W91-01451 5

Role of Ammonium and Nitrate Retention in the Acidification of Lakes and Forested Catchments.
W91-01718 5B

Chemical Composition of Bulk Precipitation Across the Mountains of Snowdonia, U.K.
W91-01820 2B

Atmospheric Input of Inorganic Nitrogen Species to the Kiel Bight.
W91-01921 5B

CHERNOBYL
Contamination of Bavarian Lakes After the Chernobyl Reactor Accident: A Two-Compartment Model Analysis.
W91-01185 5B

CHERRY POINT
Hydrogeologic, Water-Level, and Water-Quality Data from Monitoring Wells at the U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-01844 5B

CHESAPEAKE BAY
Microbial Biomass in the Coastal Plume of Chesapeake Bay: Phytoplankton-Bacterioplankton Relationships.
W91-01036 2L

Oceanic and Estuarine Ammonium Oxidation: Effects of Light.
W91-01046 2L

Role of Nutrition in Regulating the Population Dynamics of Opportunistic, Surface Deposit Feeders in a Mesohaline Community.
W91-01145 2L

Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

Effects of Sunlight and Autochthonous Microbiota on Escherichia coli Survival in an Estuarine Environment.
W91-01663 5B

Modeling of Wind-Induced Destratification in Chesapeake Bay.
W91-01899 2L

Variations in Structure of Estuarine Fish Communities in Relation to Abundance of Submersed Vascular Plants.
W91-01926 2L

Natural Abundance of 15N in Particulate Nitrogen and Zooplankton in the Chesapeake Bay.
W91-01928 2L

CHINA
Laboratory Experiments on Crust Development and Rainsplash Erosion of Loess Soils, China.
W91-01087 2J

Climate and Vegetation in China. III. Water Balance and Distribution of Vegetation.
W91-01125 2I

Lateral Distribution of Suspended Sediments in Nearshore Water of Muddy Coast of Lianyungang Harbour (in Chinese).
W91-01567 2J

Studies on the Physico-Chemical Properties of Water their Variation in the Erhai Lake (in Chinese).
W91-01568 2H

Lakeshore Swamps of Bositeng Lake in the Xinjiang Autonomous Region (in Chinese).
W91-01569 2H

Classification of Estuaries in China (in Chinese).
W91-01570 2L

Study of Pollutant Diffusion in the Jiujiang Segment of the Changjiang River (in Chinese).
W91-01571 5B

Accumulation of Heavy Metals and the Variation of Amino Acids and Protein in Eichhornia crassipes (Mart.) Solms in the Dianchi Lake (in Chinese).
W91-01572 5B

Soda Lakes on Inner Mongolia Plateau, China.
W91-01574 2H

Water Body Evaporation Experiment of Poyang lake (in Chinese).
W91-01576 2H

Analysis of Air Temperature Effect of Taihu Lake (in Chinese).
W91-01577 2H

Two-Dimensional Numerical Calculation of Residual Current and Salinity at the Changjiang River Estuary (in Chinese).
W91-01578 2L

Phosphate Limitation in Estuarine and Coastal Waters of China.
W91-01923 2L

Supply and Deposition of Sediment along the North Bank of Hangzhou Bay, China.
W91-01942 2J

CHINOOK
Hydroelectric Dams and the Decline of Chinook Salmon in the Columbia River Basin.
W91-01560 6G

CHLORELLA
Growth and Value of Chlorella salina Grown on Highly Saline Sewage Effluent.
W91-01708 5D

CHLORIDES
Indicators of Chemical Pollution from Septic Systems.
W91-01785 5A

Decreasing Chloride Trends Observed at Lake Erie Municipal Water Intakes.
W91-01793 5G

CHLORINATED AROMATIC COMPOUNDS
Geographic Variation of Chlorinated Hydrocarbons in Burbot (Lota lota) from Remote Lakes and Rivers in Canada.
W91-02033 5B

CHLORINATED HYDROCARBONS
Immobilized-Cell Degradation of Chlorophenols.
W91-01151 5D

Recovery of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone from Water Samples on XAD Resins and the Effect of Chlorine on Its Mutagenicity.
W91-01181 5A

Chlorinated Solvents in UK Aquifers.
W91-01271 5B

Interaction of Carbon Tetrachloride with Beta-Naphthoflavone-Mediated Cytochrome P450 Induction in Winter Flounder (Pseudopleuronectes americanus).
W91-01279 5C

Simultaneous Dual Column, Dual-Detector Gas Chromatographic Determination of Chlorinated Pesticides and Polychlorinated Biphenyls in Environmental Samples.
W91-01281 5A

Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part 2, Results of Biostimulation and Biotransformation Experiments.
W91-01299 5G

Fate of Selected Chlorinated Organic Compounds during Semi-Continuous Anaerobic Sludge Digestion.
W91-01319 5D

Effect of pH on the Accumulation Kinetics of Pentachlorophenol in Goldfish.
W91-01321 5B

Incorporation of a Subacute Test with Zebra Fish into a Hierarchical System for Evaluating the Effect of Toxicants in the Aquatic Environment.
W91-01327 5C

Rate of Degradation of 1,1,1-Trichloroethane in Water by Hydrolysis and Dehydrochlorination.
W91-01729 5B

Population Exposure to Chlorophenols, Dibenzo-p-Dioxins and Dibenzofurans After a Prolonged Ground Water Pollution by Chlorophenols.
W91-01734 5B

Effect of Sulfate and Organic Carbon Supplements on Reductive Dehalogenation of Chloroanilines in Anaerobic Aquifer Slurries.
W91-01760 5B

Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part I, Methodology and Field Site Characterization.
W91-01789 5G

Relationship Between Chlorinated Hydrocarbons and Organic Carbon in Sediment and Porewater.
W91-01795 5B

Inorganic and Organic Ground-Water Chemistry in the Canal Creek Area of Aberdeen Proving Ground, Maryland.
W91-01837 5B

Supercritical Fluid Extraction and Its Application to Environmental Analysis.
W91-01916 5A

NOAA's Status and Trends Mussel Watch Program: Chlorinated Pesticides and PCBs in Oysters (Crassostrea virginica) and Sediments from the Gulf of Mexico.
W91-01933 5A

Concentrations of Organochlorine Compounds in the Hermit Crab Pagurus bernhardus from the German Bight, December 1988 - May 1989.
W91-01941 5B

Biodegradation of Chlorinated Hydrocarbons in an Immobilized Bed Reactor.
W91-01948 5D

In Situ Biodegradation of TCE Contaminated Groundwater.
W91-01953 5G

CHLORINATION
Plasma Chloroform Concentrations in Swimmers Using Indoor Swimming Pools.
W91-01053 5B

Recovery of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone from Water Samples on XAD Resins and the Effect of Chlorine on Its Mutagenicity.
W91-01181 5A

Interface of Health Effects and Chemistry at Water Treatment Plants.
W91-01226 5F

Formation of PCDDs and PCDFs by the Chlorination of Water.
W91-01725 5F

LIBRARY U. OF I. URBANA-CHAMPAIGN

CHLORINE
Recovery of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone from Water Samples on XAD Resins and the Effect of Chlorine on Its Mutagenicity.
W91-01181 5A

Effects of Sublethal Exposure to Chlorine on the Uptake of Polychlorinated Biphenyl Congeners by Rainbow Trout, Salmo gairdneri (Richardson).
W91-01367 5C

CHLOROANILINE
Species-Specific Reaction of Liver Ultrastructure in Zebrafish (Brachydanio rerio) and Trout (Salmo gairdneri) after Prolonged Exposure to 4-Chloroaniline.
W91-01317 5C

CHLOROFORM
Plasma Chloroform Concentrations in Swimmers Using Indoor Swimming Pools.
W91-01053 5B

CHLOROPHENOLS
Population Exposure to Chlorophenols, Dibenzo-p-Dioxins and Dibenzofurans After a Prolonged Ground Water Pollution by Chlorophenols.
W91-01734 5B

CHLOROPHYLL
Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

Numbers and Activity of Bacterioplankton in Various Types of Waters in Czechoslovakia: Relations to Chlorophyll Concentration.
W91-01610 2H

Changes in Spatial Distribution of Primary Production, Photosynthetic Pigments and Phytoplankton Species Composition During Two Surveys in the German Bight.
W91-01939 2L

CHLOROPHYLL A
Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

CHLOROPHYTA
Bioaccumulation and Toxicity of Zinc in the Green Alga, Cladophora glomerata.
W91-01111 5C

Spirogyra Species and Accompanying Algae from Pools and Ditches in The Netherlands.
W91-01333 5C

Growth and Value of Chlorella salina Grown on Highly Saline Sewage Effluent.
W91-01708 5D

CHLOROSTILBENE OXIDE
Hydrolysis of Chlorostilbene Oxide: II. Modeling of Hydrolysis in Aquifer Samples and in Sediment-Water Systems.
W91-01256 5B

CHLORPYRIFOS
Rapid Method for the Simultaneous Analysis of Chlorpyrifos, Isofenphos, Carbaryl, Iprodione, and Triadimefon in Groundwater by Solid-Phase Extraction.
W91-01917 5A

CHROMATES
Reduction of Toxic Chromate in an Industrial Effluent by Use of a Chromate-Reducing Strain of Enterobacter Cloacae.
W91-01641 5D

CHROMATOGRAPHY
Reversed-Phase Liquid Chromatographic Column Switching for the Trace-Level Determination of Polar Compounds. Application to Chloroallyl Alcohol in Ground Water.
W91-01918 5A

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

Gas Chromatography in Environmental Analysis: Aims and Challenges.
W91-01954 5A

GC-FTIRS: Applications in Organic Trace Analysis.
W91-01956 5A

Determination of Ortho-and Pyrophosphates in Waters by Extraction Chromatography and Flow-Injection Analysis.
W91-01962 5A

Effects of XAD-8 Fractions of Dissolved Organic Carbon on the Sorption and Bioavailability of Organic Micropollutants.
W91-02034 5B

Multiresidue Method by High Performance Liquid Chromatography-based Fractionation and Gas Chromatographic Determination of Trace Levels of Pesticides in Air and Water.
W91-02038 5A

CHROMIUM
Aqueous Behavior of Chromium in Coal Fly Ash.
W91-01006 5B

In Vivo Recovery of Glycogen Metabolism in Hemolymph and Tissues of a Freshwater Field Crab Barytelphusa guerini on Exposure to Hexavalent Chromium.
W91-01324 5C

Reduction of Toxic Chromate in an Industrial Effluent by Use of a Chromate-Reducing Strain of Enterobacter Cloacae.
W91-01641 5D

Trends in the Heavy Metal Levels in the Dissolved and Particulate Phase in the Dutch Rhine-Meuse (Maas) Delta.
W91-01817 5B

Minimization of Chromium-Contaminated Wastewater at a Plating Facility in the Eastern United States.
W91-01947 5D

Behavior of Heavy Metals During Wastewater Treatment, I. Cadmium, Chromium and Copper.
W91-02012 5D

CHRONIC TOXICITY
Behavioral Indicators of Sublethal Toxicity in Rainbow Trout.
W91-01315 5C

Effect of Heavy Metals on Bay Scallops, Surf Clams, and Blue Mussels in Acute and Long-term Exposures.
W91-01973 5C

CHRYSOPHYTA
Utility of Scaled Chrysophytes for Inferring Lakewater pH in Northern New England Lakes.
W91-01502 2H

CHUBS
Mercury, Cadmium and Lead Concentrations in Five Species of Freshwater Fish from Eastern England.
W91-01822 5B

CICHLID
Effects of Water-Borne Cadmium on Plasma Cortisol and Glucose in the Cichlid Fish Oreochromis mossambicus.
W91-01777 5C

CIPROFIBRATE
Induction of Peroxisome Proliferation in Rainbow Trout Exposed to Ciprofibrate.
W91-01280 5C

CIVIL ENGINEERING
Upgrading Antique Sewers.
W91-01484 5B

Siphoning Sludge.
W91-01485 5D

Grouting Slip Liners: The New Inside Story.
W91-01486 5D

CLAMS
Predicting Bioaccumulation Potential: A Test of a Fugacity-Based Model.
W91-01316 5B

Effect of Heavy Metals on Bay Scallops, Surf Clams, and Blue Mussels in Acute and Long-term Exposures.
W91-01973 5C

CLASSIFICATION
Modified Koeppen Classification Applied to Model Simulations of Glacial and Interglacial Climates.
W91-01091 2B

Wetland Identification: A Means to Prevent Potential Public Health Problems.
W91-01380 2H

CLAY MINERALS
Basic Model of Water- and Gas-flow through Smectite Clay Buffers.
W91-01458 2C

CLAYS
Siltation of Stone-Surface Periphyton in River by Clay-Sized Particles from Low Concentrations in Suspension.
W91-01353 2

Basic Model of Water- and Gas-flow through Smectite Clay Buffers.
W91-01458 2C

Calibration and Validation of a Model of Nor Interactive Solute Leaching in a Clay-Loar Arable Soil.
W91-01477 7C

Clay, Dissolved Organic Matter, and Bacteri Interactions in Two Reservoirs.
W91-01600 2I

Laboratory Studies of the Flow of Some Orga ic Solvents and Their Aqueous Solutio Through Bentonite and Kaolin Clays.
W91-01781 5

CLEAN WATER ACT
Clean Water Act: A Good Beginning.
W91-01095 5

United States v. Larkins: Conflict Between W land Protection and Agriculture; Exploration the Farming Exemption to the Clean Wat Act's Section 404 Permit Requirements.
W91-01123 6

Citizen Enforcement of Clean Water Act Vio tions; The Supreme Court Steers a New Cou over Muddied Waters; Gwaltney of Smithfie Ltd. v. Chesapeake Bay Foundation, Inc.
W91-01634 6

CLEANUP
Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part 2, Results of Biostimulation and Biotransformation Experiments.
W91-01299 5G

Multidimensional Simulation Applied to Water Resources Management.
W91-01508 6B

CLEANUP OPERATIONS
Polycyclic Aromatic Hydrocarbon Emissions from the Combustion of Crude Oil on Water.
W91-01066 5B

EPA's Pesticides-in-Groundwater Strategy: Agency Action in the Face of Congressional Inaction.
W91-01094 5G

Soil Clean Up by In-situ Aeration: V. Vapor Stripping from Fractured Bedrock.
W91-01756 5G

Groundwater Treatment with Zero Air Emissions.
W91-01946 5G

Performance of Selected In Situ Soil Decontamination Technologies: An Air Force Perspective.
W91-01949 5G

Design Considerations for Soil Cleanup by Soil Vapor Extraction.
W91-01952 5G

Macroinvertebrate and Periphyton Response to Streambed Agitation for Release of Substrate-Trapped Hydrocarbons.
W91-02019 5C

CLEAR-CUTTING
Nutrient Export in Stormflow Following Forest Harvesting and Site-Preparation in East Texas.
W91-01009 5B

Effects of Clearfelling a Sitka Spruce Stand on the Water Balance of a Peaty Gley Soil at Kershope Forest, Cumbria.
W91-01069 4C

CLIFFS-DOW SUPERFUND SITE
Natural Bioremediation of Organic Contaminants in Ground Water: Cliffs-Dow Superfund Site.
W91-01782 5B

CLIMATES
Temporal Variability of Soil Wetness and Its Impact on Climate.
W91-01090 2G

Modified Koeppen Classification Applied to Model Simulations of Glacial and Interglacial Climates.
W91-01091 2B

CLIMATIC CHANGES
Modified Koeppen Classification Applied to Model Simulations of Glacial and Interglacial Climates.
W91-01091 2B

Global Climate Change: Implications for Air Temperature and Water Supply in Canada.
W91-01388 2B

Potential Changes in Thermal Structure and Cycle of Lake Michigan Due to Global Warming.
W91-01389 2H

Effects of Climate Warming on Dissolved Oxygen Concentrations in Lake Erie.
W91-01391 2H

Potential Application of Models in Forecasting the Effects of Climate Changes on Fisheries.
W91-01392 2B

Temperature-Oxygen Habitat for Freshwater and Coastal Striped Bass in a Changing Climate.
W91-01393 2B

Potential Changes in the Thermal Habitat of Great Lakes Fish after Global Climate Warming.
W91-01394 2B

Potential Effects of Global Climate Warming on the Growth and Prey Consumption of Great Lakes Fish.
W91-01395 2B

Potential Loss of Thermal Habitat for Brook Trout, Due to Climatic Warming, in Two Southern Ontario Streams.
W91-01397 8I

Sea Lamprey as an Early Responder to Climate Change in the Great Lakes Basin.
W91-01398 2B

Size-Dependent Winter Mortality of Young-of-the-Year White Perch: Climate Warming and Invasion of the Laurentian Great Lakes.

User Defined Conduits in the EXTRAN Block of SWMM.
W91-01189 4C

Application of SWMM in the New Orleans Area.
W91-01195 4C

Distributed Rainfall-Runoff Modeling Based on Digital Map Database.
W91-01203 7C

Solving Groundwater Flow Problems by Conjugate-Gradient Methods and the Strongly Implicit Procedure.
W91-01515 2F

Implementation of On-Line Control Scheme for City Water System.
W91-01559 5F

Balancing the SCADA Equation for the First-Time User.
W91-01564 7B

Simulation Model of Water Depth in Mangrove Basin Forests.
W91-01989 2L

COMPUTER PROGRAMS

Multi-Model Micro-Computer Based Wet Detention Basin Design Methodology.
W91-01200 4C

Hydrologic Data Automation Using AutoCAD.
W91-01202 7C

PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

Computer Aided Planning of Drainageway Improvements Made Easy with LOTUS 1-2-3.
W91-01205 7C

Determination of Designated Floodway Boundaries Around Long Islands in Stream Channels.
W91-01209 2E

Hydrogeologic Database for Ground-Water Modeling.
W91-01298 7C

Balancing the SCADA Equation for the First-Time User.
W91-01564 7B

Development of an Expert System Embedding Pattern Recognition Technique for Groundwater Pollution Source Identification.
W91-01825 5B

Evaluation of Three Electronic Report Processing Systems for Preparing Hydrologic Reports of the U.S. Geological Survey, Water Resources Division.
W91-01832 10C

COMPUTERIZED IRRIGATION SCHEDULING

Computerized Scheduling for Irrigation Management and Pumping Operations in the Watercourse Command.
W91-01404 3F

COMPUTERS

Q2X: An (Expert) Systems Approach to Quantity and Quality Management of Strategic Resources.
W91-01213 5G

LIBRARY U. OF I. URBANA-CHAMPAIGN

COMPUTERS

U.S. Geological Survey National Computer Technology Meeting: Program and Abstracts, May 7-11, 1990.
W91-01848 7C

CONCRETE DAMS

Monitoring High Concrete Dams During Their Construction and Service.
W91-01440 8F

Mechanism of the Opening of the Concrete-Rock Joint in the Sayano-Shushenskoe Dam.
W91-01441 8F

Concerning the Problem of Assigning the Compositions of Steel Fiber-reinforced Concretes.
W91-01549 8F

Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

CONCRETE TECHNOLOGY

Reinforcement of In-Service Retaining Structures.
W91-01442 8A

Concerning the Problem of Assigning the Compositions of Steel Fiber-reinforced Concretes.
W91-01549 8F

Investigation of Concrete in Absorbing Formwork.
W91-01653 8F

Dam Renovation: From Investigation to Repair.
W91-01748 8F

CONCRETE TESTING

Investigation of Concrete in Absorbing Formwork.
W91-01653 8F

CONCRETES

Investigation of Concrete in Absorbing Formwork.
W91-01653 8F

CONDENSATES

Entrainment and Mixing Processes as Related to Droplet Growth in Warm Midlatitude and Tropical Clouds.
W91-01657 2B

CONDUCTIVITY

Most Dilute Lake in the World.
W91-01348 2H

Indicators of Chemical Pollution from Septic Systems.
W91-01785 5A

CONDUITS

User Defined Conduits in the EXTRAN Block of SWMM.
W91-01189 4C

Revised Runoff Block of SWMM.
W91-01190 4C

CONNECTICUT RIVER VALLEY

Summary of Public Water-Supply Withdrawals and Geohydrologic Data for the Lower Connecticut River Valley from Windsor to Vernon, Vermont.
W91-01845 2F

CONSERVATION

Bersani v. EPA: Toward a Plausible Interpretation of the 404(b)(1) Guidelines for Evaluating Permit Applications for Wetland Development.
W91-01092 5G

Federal-State Tensions in Australian Environmental Management: The World Heritage Issue.
W91-01102 6G

Queensland Rainforest and Wetlands Conflict: Australia's External Affairs Power--Domestic Control and International Conservation.
W91-01104 6E

CONSTRUCTION

Measuring the Productivity of Construction Maintenance Operations.
W91-01749 5F

CONSTRUCTION JOINTS

Mechanism of the Opening of the Concrete-Rock Joint in the Sayano-Shushenskoe Dam.
W91-01441 8F

CONSTRUCTION METHODS

Design of Rock Slopes in Soviet Hydropower Construction Practice.
W91-01433 8A

Reinforcement of In-Service Retaining Structures.
W91-01442 8A

Effective Design of Facings of Blast-formed Dams.
W91-01547 8A

What Results when the Building Codes are not Observed.
W91-01550 8B

CONSUMPTIVE USE

Effects of Irrigation Methods on Growth, Yield and Consumptive Use of Water of Banana cv. Nendran Grown in Clay Loam Soils.
W91-01117 3F

CONTACT BEDS

Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

CONTACTORS

Anaerobic Treatment of Baker's Yeast Wastewater: II. Sulfate Removal.
W91-01322 5D

CONTAMINATION

EPA's Pesticides-in-Groundwater Strategy: Agency Action in the Face of Congressional Inaction.
W91-01094 5G

CONTINENTAL SHELF

Direct Impacts of Outer Continental Shelf Activities on Wetland Loss in the Central Gulf of Mexico.
W91-01099 2L

Influence of Hudson Bay Runoff and Ice-Melt on the Salinity of the Inner Newfoundland Shelf.
W91-01432 2E

CONTROL SYSTEMS

Implementation of On-Line Control Scheme for City Water System.
W91-01559 5F

CONVECTION

Momentary Instability of a Saturated Porous Layer with a Time-Dependent Temperature Distribution, and the Most Unstable Disturbance.
W91-01518 5B

Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 2. Application and Implications for Modeling Strategy.
W91-01525 2F

CONVECTIVE CLOUDS

Semi-Empirical Approach to Estimate Vertical Transport by Nonprecipitating Convective Clouds on a Regional Scale.
W91-01287 5B

CONVECTIVE PRECIPITATION

Thunderstorms above Frontal Surfaces in Environments without Positive CAPE. Part I: A Climatology.
W91-01481 2B

Thunderstorms above Frontal Surfaces in Environments without Positive CAPE. Part II: Organization and Instability Mechanisms.
W91-01482 2B

COOLING PONDS

Peculiarities of the Formation of Bottom Deposits in a Closed-Cooling Pond.
W91-01444 8C

COOPERATIVES

Hydrological Information Transfer Using HOMS.
W91-01274 7C

COPEPODS

Comparative Toxicities of Selected Industrial Chemicals to Microorganisms and Other Aquatic Organisms.
W91-02041 5C

COPPER

Green Oysters Caused by Copper Pollution on the Taiwan Coast.
W91-01108 5C

Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

Copper Toxicity to Paratya australiensis: II. Influence of Bicarbonate and Ionic Strength.
W91-01259 5C

Copper Toxicity to Paratya australiensis: III. Influence of Dissolved Organic Matter.
W91-01260 5C

Macroinvertebrate Community Responses to Copper in Laboratory and Field Experimental Streams.
W91-01312 5C

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Trends in the Heavy Metal Levels in the Dissolved and Particulate Phase in the Dutch Rhine-Meuse (Maas) Delta.
W91-01817 5B

Zinc and Copper in Fish from Natural Waters and Rearing Ponds in Northern Italy.
W91-01958 5B

Transport of Heavy Metals Within a Small Urban Catchment.
W91-01992 5B

Behavior of Heavy Metals During Wastewater Treatment, I. Cadmium, Chromium and Copper
W91-02012 5D

Effects of Diet, Water Hardness, and Population Source on Acute and Chronic Copper Toxicity to Ceriodaphnia dubia.
W91-02024 5C

COPPER COMPOUNDS

Molluscicidal and Piscicidal Properties o Copper(II) Tetraoxosulfate(VI) on Bulinus glo bosus (Morelet) and Clarias anguillaris (L).
W91-01363 5C

Examination of the Range of Copper Complex ing Ligands in Natural Waters Using a Combina tion of Cathodic Stripping Voltammetry an Computer Simulation.
W91-01715 5I

COPPER SULFATE
Effect of Copper Sulfate on Hematology, Blood Chemistry, and Hepato-Somatic Index of an Indian Catfish, Heteropneustes fossilis (Block), and Its Recovery.
W91-01325 5C

CORES
Variability of Diatom Concentrations and Accumulation Rates in Sediments of a Small Lake Basin.
W91-01049 2H

Paleoecological Investigation of Recent Lake Acidification in the Adirondack Mountains, N.Y.
W91-01499 5B

Sequentially Extracted Metals in Adirondack Lake Sediment Cores.
W91-01500 2H

CORN
Water and Fertilizer Interrelations with Irrigated Maize.
W91-01408 3F

Heat Stress, Plant-Available Soil Moisture, and Corn Yields in Iowa: A Short- and Long-Term View.
W91-01703 3F

CORROSION
Contamination of Potable Water by Corrosion of Tin-Lead Soldered Joints.
W91-01222 5B

COSMIC RAYS
Thunderstorms, Cosmic Rays, and Solar-Lunar Influences.
W91-01490 2B

COST ANALYSIS
Adopting Water-Conserving Irrigation Technology: The Case of Surge Irrigation in Arizona.
W91-01405 3F

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: II. Production and Income.
W91-01504 5E

COST-BENEFIT ANALYSIS
Water Quality: The Public Dimension.
W91-01218 5G

Demand-Based Benefit-Cost Model of Participation in Water Project.
W91-01551 6D

COSTA RICA
Seasonal and Tidal Abundance of Crab Larvae in a Tropical Mangrove System, Gulf of Nicoya, Costa Rica.
W91-01927 2L

CRABS
In Vivo Recovery of Glycogen Metabolism in Hemolymph and Tissues of a Freshwater Field Crab Barytelphusa guerini on Exposure to Hexavalent Chromium.
W91-01324 5C

Seasonal and Tidal Abundance of Crab Larvae in a Tropical Mangrove System, Gulf of Nicoya, Costa Rica.
W91-01927 2L

Concentrations of Organochlorine Compounds in the Hermit Crab Pagurus bernhardus from the German Bight, December 1988 - May 1989.
W91-01941 5B

CREOSOTE
Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

CROP PRODUCTION
Agriculture: A Positive Contribution to Water Quality.
W91-01249 5G

CROP YIELD
Effect of Scheduling Irrigation and Phosphorus Levels on Yield of Pigeonpea in Gang Command Area.
W91-01116 3F

Canopy Temperature as an Indicator of Differential Water Use and Yield Performance Among Wheat Cultivars.
W91-01407 3F

Water and Fertilizer Interrelations with Irrigated Maize.
W91-01408 3F

Dynamics of Root and Shoot Growth of Barley Under Various Levels of Salinity and Water Stress.
W91-01409 3F

Heat Stress, Plant-Available Soil Moisture, and Corn Yields in Iowa: A Short- and Long-Term View.
W91-01703 3F

Cropping System and Tillage Effects on Available Soil Water and Yield of Grain Sorghum and Winter Wheat.
W91-01705 3F

CROPS
Nitrate Leaching from Systematically Tiled Potato Fields in New Brunswick, Canada.
W91-01016 5B

CROWNVETCH
Triazine Herbicide Fate in a No-Tillage Corn (Zea mays L.)-Crownvetch (Coronilla varia L.) 'Living Mulch' System.
W91-01709 5B

CRUST DEVELOPMENT
Laboratory Experiments on Crust Development and Rainsplash Erosion of Loess Soils, China.
W91-01087 2J

CRUSTACEANS
Effects of Salinity, Temperature, and Cadmium on Cadmium-binding Protein in the Grass Shrimp, Palaemonetes pugio.
W91-01309 5B

In Vivo Recovery of Glycogen Metabolism in Hemolymph and Tissues of a Freshwater Field Crab Barytelphusa guerini on Exposure to Hexavalent Chromium.
W91-01324 5C

Occurrence of Limnic Micro-Crustaceans in Relation to pH and Humic Content in Swedish Water Bodies.
W91-01350 2H

Partitioning of Lindane Between Sediment, Water and the Crustacean Metapenaeus macleayi.
W91-02042 5B

CULTIVATED LANDS
Effect of Rock Bunds and Tied Ridges on Soil Water Content and Soil Properties in the Sudan Savannah of Burkina Faso.
W91-01330 3F

CULTURE MEDIA
Improved Detection of Acid Mine Water Stressed Coliform Bacteria on Media Containing Catalase and Sodium Pyruvate.
W91-01770 5A

CULTURING TECHNIQUES
Chemostat Studies of a Mixed Culture Growing on Phenolics.
W91-01175 5D

Growth of Bacteria on Organic Matter Produced by Algae in Continuous Cultures.
W91-01589 2H

Simple and Rapid Method for Screening of Heavy Oil-Degrading Bacteria from Marine Environment.
W91-01961 5G

CURRENT METERS
Shot-Sensor Method of Measuring Currents in Shallow Estuarine Waters.
W91-01900 7B

CYANOPHYTA
Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Environmental Factors Affecting the Production of Peptide Toxins in Floating Scums of the Cyanobacterium Microcystis aeruginosa in a Hypertrophic African Reservoir.
W91-01065 2H

Is It Possible to Regain an Ecological Balance in a Lake With Blooms of Nuisance Microorganisms.
W91-01220 5C

Cyanobacterial Toxins in European Waters: Occurrence, Properties, Problems and Requirements.
W91-01221 5B

Colonization Process of a Typical Epilithic Algal Community--Homoeothrix janthina-Achnanthes japonica Community--in a Less Polluted River in Japan (in Japanese).
W91-01383 2H

Isolation and Characterization of Hepatotoxic Microcystin Homologs from the Filamentous Freshwater Cyanobacterium Nostoc sp. Strain 152.
W91-01761 2H

Effects of Light, Temperature, Nitrate, Orthophosphate, and Bacteria on Growth of and Hepatotoxin Production by Oscillatoria agardhii Strains.
W91-01762 5B

Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

Toxicity and Bioaccumulation of Selenate, Selenite and Seleno-L-Methionine in the Cyanobacterium Anabaena flos-aquae.
W91-02028 5C

CYCLING NUTRIENTS
Nutrient Dynamics in a Floating Mat and Pond System with Special Reference to Its Vegetation.
W91-01126 2H

Bacterial Mediation in the Utilization of Carbon and Nitrogen from Detrital Complexes by Crassostrea virginica.
W91-01141 2L

Decomposition Rate, Chemical Composition and Nutrient Recycling of Nymphaea alba L. Floating Leaf Blade Detritus as Influenced by pH, Alkalinity and Aluminium in Laboratory Experiments.
W91-01332 2H

LIBRARY U. S. ENVIRONMENTAL PROT.

CYCLING NUTRIENTS

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: II. Production and Income.
W91-01504 5E

Existing Forms of Phosphorus in Sediment from Middle and Northern Taiwan Strait (in Chinese).
W91-01575 2L

Experimental Use of Dialysis Chamber Arrays to Study P-Fluxes in the Bay of Quinte, 1987.
W91-01796 2H

CYTOCHROMES

Interaction of Carbon Tetrachloride with Beta-Naphthoflavone-Mediated Cytochrome P450 Induction in Winter Flounder (Pseudopleuronectes americanus).
W91-01279 5C

CYTOLOGY

Detection of Organic Toxic Pollutants in Water and Waste-Water by Liquid Chromatography and In Vitro Cytotoxicity Tests.
W91-01712 5A

CZECHOSLOVAKIA

Numbers and Activity of Bacterioplankton in Various Types of Waters in Czechoslovakia: Relations to Chlorophyll Concentration.
W91-01610 2H

DAM CONSTRUCTION

Design of Rock Slopes in Soviet Hydropower Construction Practice.
W91-01433 8A

Analytical Method of Calculating Slope Stability.
W91-01434 8D

Monitoring High Concrete Dams During Their Construction and Service.
W91-01440 8F

Initial Period of Operation of the Channel Dam of the Kureika Hydroelectric Station.
W91-01542 8A

Effective Design of Facings of Blast-formed Dams.
W91-01547 8A

Concerning the Problem of Assigning the Compositions of Steel Fiber-reinforced Concretes.
W91-01549 8F

Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

DAM DESIGN

Predicting Wave Formation in Mountain Reservoirs During Landfalls and Landslides.
W91-01443 8B

Effective Design of Facings of Blast-formed Dams.
W91-01547 8A

Concerning the Problem of Assigning the Compositions of Steel Fiber-reinforced Concretes.
W91-01549 8F

Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

DAM EFFECTS

Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

Hydroelectric Dams and the Decline of Chinook Salmon in the Columbia River Basin.
W91-01560 6G

Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

Abundance of Spawning Pacific Salmon in Two Lake Superior Streams, 1981-1987.
W91-01791 8I

Perspective on America's Vanishing Streams.
W91-01812 6G

Suspended Sediment and Bed Load Problems of the Upper Rhine.
W91-01871 4D

DAM FAILURE

Mechanism of the Opening of the Concrete-Rock Joint in the Sayano-Shushenskoe Dam.
W91-01441 8F

Predicting Wave Formation in Mountain Reservoirs During Landfalls and Landslides.
W91-01443 8B

DAM FOUNDATIONS

Monitoring the State of the Dam of the Sayano-Shushenskoe Hydroelectric Station.
W91-01541 8A

DAM INSPECTION

Monitoring High Concrete Dams During Their Construction and Service.
W91-01440 8F

DAM STABILITY

Monitoring High Concrete Dams During Their Construction and Service.
W91-01440 8F

Mechanism of the Opening of the Concrete-Rock Joint in the Sayano-Shushenskoe Dam.
W91-01441 8F

DAMS

Initial Period of Operation of the Channel Dam of the Kureika Hydroelectric Station.
W91-01542 8A

Downstream of the Novosibirsk Hydroelectric Station on the Ob River.
W91-01544 4A

Mechanical Equipment of the Tashlyk Pumped-Storage Hydroelectric Station and Aleksandrovka Hydro Development of the Southern Ukraine Power Complex.
W91-01644 8C

Mechanical Equipment of the Vilyui No. 3 Hydroelectric Station.
W91-01645 8C

Seepage in Earth Dams in Two- and Three-Dimensional Formulations of the Problem.
W91-01650 8D

Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

Bearspaw Development: Design and Construction of a Side-Channel Overflow Spillway.
W91-01721 8B

Dam Renovation: From Investigation to Repair.
W91-01748 8F

DAPHNIA

Comparison of Measured Instream Biological Responses with Responses Predicted Using the Ceriodaphnia dubia Chronic Toxicity Test.
W91-01261 5C

Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Acute Toxicities of Five Synthetic Pyrethroid Insecticides to Daphnia magna and Ceriodaphnia dubia.
W91-01263 5C

Assessment of the Ontario Ministry of the Environment Protocols for Conducting Daphnia magna Acute Lethal Toxicity Tests with Pulp and Paper Mill Effluents.
W91-01266 5C

Effect of 3,4-Dichloroaniline and Metavanadate on Daphnia Populations.
W91-01326 5C

Refuge Availability: A Key to Understanding the Summer Disappearance of Daphnia.
W91-01342 2H

DARWIN HARBOUR

Heavy Metal Concentration in Telescopium from Darwin Harbour, N.T., Australia.
W91-01164 5A

DATA ACQUISITION

Device for In Situ Determination of Geochemical Transport Parameters. 1. Retardation.
W91-01293 5B

Use of Tree-Ring Chemistry to Document Historical Ground-Water Contamination Events.
W91-01295 5B

Logging of Special Hydrogeological Wells.
W91-01360 7B

Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Implementation of On-Line Control Scheme for City Water System.
W91-01559 5F

Balancing the SCADA Equation for the First-Time User.
W91-01564 7E

Use of Polarization to Characterize Precipitation and Discriminate Large Hail.
W91-01656 2E

Estimating the Variation of Buoy Wind and Wave Data Biases.
W91-01797 2E

Primer on Clothing Systems for Cold-Weather Field Work.
W91-01846 7I

Measuring Techniques for Gas/Solid Fluidized Bed Reactors (MeBtechniken fur Gas/Feststoff Wirbelschichtreaktoren).
W91-01896 5I

DATA ANALYSIS

Estimating the Variation of Buoy Wind and Wave Data Biases.
W91-01797 2I

DATA COLLECTIONS

Occurrence of Limnic Micro-Crustaceans in Relation to pH and Humic Content in Swedish Water Bodies.
W91-01350 2

Evaluation of the Potential for Toxics Exposure in the Great Lakes Region Using Storet Data
W91-01732 5

Ground-Water Levels, Flow, and Specific Conductance in Unconsolidated Aquifers Near Lake Erie, Cleveland to Conneaut, Ohio, September 1984.
W91-01855 2F

DATA INTERPRETATION
Distributed Rainfall-Runoff Modeling Based on Digital Map Database.
W91-01203 7C

Flood Hydrograph for Ungaged Watershed.
W91-01207 7C

Unit-Hydrograph Procedures for Arid Lands.
W91-01208 7C

Determination of Designated Floodway Boundaries Around Long Islands in Stream Channels.
W91-01209 2E

Use of a Compartmental Model to Develop Rules for the Interpretation of Water Quality Data.
W91-01214 5B

Analysis of RADM Gas Concentration Predictions Using OSCAR and NEROS Monitoring Data.
W91-01285 5B

Lognormal Distribution of Radon Concentration in Ground Water.
W91-01294 5B

Pharmacokinetic Modeling in Aquatic Animals. I Models and Concepts.
W91-01361 5A

Influence of Temperature Changes on Aquatic Ecosystems: An Interpretation of Empirical Data.
W91-01403 2B

Regionalization and Spatial Estimation of Ethiopian Mean Annual Rainfall.
W91-01466 2B

Prediction Model for Snowmelt, Snow Surface Temperature and Freezing Depth Using a Heat Balance Method.
W91-01469 2C

Meta-Analytic Reappraisal of Statistical Results in the Environmental Sciences: The Case of a Hydrological Effect of Cloud Seeding.
W91-01470 3B

Further Exploratory Evaluations of Grossversuch IV Using Hailpad Data: Analysis of Hail Patterns and Stratification by Storm Type for Seeding Effect.
W91-01471 2B

Algorithm for Retrieving Water Vapor Profiles in Clear and Cloudy Atmospheres from 183 GHz Radiometric Measurements: Simulation Studies.
W91-01474 7C

Simplified Analysis of Soil Water Flow to a Mole Drain.
W91-01476 2G

Calibration and Validation of a Model of Non-Interactive Solute Leaching in a Clay-Loam Arable Soil.
W91-01477 7C

Development, Calibration and Field Testing of a Soil Loss and a Runoff Model Derived from a Small-Scale Physical Simulation of the Erosion Environment on Arable Land in Zimbabwe.
W91-01478 2J

Three-Dimensional Computation of Flow and Bed Deformation.
W91-01493 2J

Preview Analysis of National Sludge Survey.
W91-01661 5E

Analysis of 228Ra and 226Ra in Public Water Supplies by a Gamma-Ray Spectrometer.
W91-01667 5A

CO2 Climate Sensitivity and Snow-Sea-Ice Albedo Parameterization in an Atmospheric GCM Coupled to a Mixed-Layer Ocean Model.
W91-01694 5C

Measurement of Surface Tension in Agricultural Waste Slurries.
W91-01702 5D

Perspective on America's Vanishing Streams.
W91-01812 6G

Interpretation of Metal Concentrations in Estuarine Sediments of Florida Using Aluminum as a Reference Element.
W91-01898 2L

DATA PROCESSING
PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

Hyetograph Compositing Effects on Urban Runoff Modelling.
W91-01206 7C

New Technology in a Water Company.
W91-01273 5F

DATA REQUIREMENTS
Variational Sensitivity Analysis, Data Requirements, and Parameter Identification in a Leaky Aquifer System.
W91-01512 2C

DATA STORAGE AND RETRIEVAL
Hydrologic Data Automation Using AutoCAD.
W91-01202 7C

Hydrological Information Transfer Using HOMS.
W91-01274 7C

DATABASES
Hydrogeologic Database for Ground-Water Modeling.
W91-01298 7C

Automating Water Resource Management.
W91-01563 7B

DEAD ZONES
Analytical Asymptotic Solutions for Longitudinal Dispersion with Dead Zones.
W91-01672 8B

DEBRIS FLOW
Influence of Debris Flows on Channels and Valley Floors in the Oregon Coast Range, U.S.A.
W91-01882 2J

DECISION MAKING
Environmental Evaluation Procedure for Coastal Developments in South Africa.
W91-01122 6B

Acid Rain and Photochemical Oxidants Control Policies in the European Community: A Decision Analysis Framework.
W91-01290 5G

Hydrogeological Decision Analysis: 1. A Framework.
W91-01301 6A

Multidimensional Simulation Applied to Water Resources Management.
W91-01508 6B

DECOMPOSING ORGANIC MATTER
Humus Form Development and Hillslope Runoff, and the Effect of Fire and Management, Under Mediterranean Forest in NE-Spain.
W91-01079 2G

Studies on the Decomposition of Lignocellulosic Carbon in a Flooded Ricefield Soil.
W91-01602 2H

Effect of Nutrient Content on Leaf Decomposition in a Coastal Plain Stream: A Comparison of Green and Senescent Leaves.
W91-01742 2H

Comparison of Detritus Processing Between Permanent and Intermittent Headwater Streams.
W91-01744 2H

Effects of Acidification on Leaf Decomposition in Streams.
W91-01803 5C

DECOMPOSITION
Decomposition of Roots in a Seasonally Flooded Swamp Ecosystem.
W91-01331 2H

Decomposition Rate, Chemical Composition and Nutrient Recycling of Nymphaea alba L. Floating Leaf Blade Detritus as Influenced by pH, Alkalinity and Aluminium in Laboratory Experiments.
W91-01332 2H

Input and Mineralization of Organic Carbon in Lakes.
W91-01601 2H

Effects of Acidification on Leaf Decomposition in Streams.
W91-01803 5C

Interstitial Dissolved Organic Carbon in Sediments of a Southern Appalachian Headwater Stream.
W91-01804 2H

DECONTAMINATION
Volatilization of Selenium from Agricultural Evaporation Pond Sediments.
W91-01814 5G

Performance of Selected In Situ Soil Decontamination Technologies: An Air Force Perspective.
W91-01949 5G

Design Considerations for Soil Cleanup by Soil Vapor Extraction.
W91-01952 5G

Decontamination of Highway Surface Runoff in the FRG.
W91-02002 5G

Pollutant Removal by Gully Pots in Different Catchment Areas.
W91-02003 5D

DEEP WELLS
Deep-Well in the North-Holland Dune Area.
W91-01304 4B

DEFORMATION
Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

DEGRADATION
Nonlinear Solution of Aggradation and Degradation in Channels.
W91-01668 2J

Kinetic Study of the Decomposition of Methyl (1-(Butylcarbamoyl)-1H-benzimidazol-2-

LIBRARY U. OF I. URBANA-CHAMPAIGN

yl)carbamate (Benomyl) to Methyl 1H-Benzimidazol-2-ylcarbamate (MBC).
W91-01739 5B

DEHALOGENATION
Rate of Degradation of 1,1,1-Trichloroethane in Water by Hydrolysis and Dehydrochlorination.
W91-01729 5B

DEHYDROGENASE ACTIVITY
Method of Measuring the Dehydrogenase Activity of Sediments.
W91-01588 2J

DELMARVA PENINSULA
Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

DELTAS
Processes Governing Marsh Formation in a Rapidly Subsiding Coastal Environment.
W91-01088 2L

DENDROCHRONOLOGY
Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

Use of Tree-Ring Chemistry to Document Historical Ground-Water Contamination Events.
W91-01295 5B

DENITRIFICATION
Denitrification in Nitrate-Rich Streams: Diurnal and Seasonal Variation Related to Benthic Oxygen Metabolism.
W91-01142 2H

Comparison of the Acidification Efficiencies of Nitric and Sulfuric Acids by Two Whole-Lake Addition Experiments.
W91-01143 5B

Control of Nitrogenous Pollution.
W91-01250 5D

Denitrification and Nitrous Oxide in the North Sea.
W91-01935 5B

Primary Production and Nitrogen Assimilation in the North Sea During July 1987.
W91-01938 2L

DENMARK
Pelagic Metabolism in Eutrophic Waters During a Late Summer Period.
W91-01929 2L

DENSITY CURRENTS
Tidal Straining, Density Currents, and Stirring in the Control of Estuarine Stratification.
W91-01128 2L

DENSITY STRATIFICATION
Tidal Straining, Density Currents, and Stirring in the Control of Estuarine Stratification.
W91-01128 2L

Anomalous Temperature and Oxygen Gradients Under the Ice of a High-Plains Lake in Wyoming.
W91-01148 2H

DENVER
Comprehensive Health Effects Testing Program for Denver's Potable Water Reuse Demonstration Project.
W91-01920 5D

DEOXYRIBONUCLEIC ACID
Incorporation of Thymidine, Adenine and Leucine into Natural Bacterial Assemblages.
W91-01931 2L

DEPOSITION
Aluminum Mobilization in Soil and Stream Waters at Three Norwegian Catchments with Different Acid Deposition and Site Characteristics.
W91-01895 5B

DEPRESSION STORAGE
Depressional Storage for Markov-Gaussian Surfaces.
W91-01539 2J

DEPURATION
Comparative Study on the Toxicity, Absorption and Depuration of Fenitrothion and Its Oxon in Japanese Tiger Shrimp.
W91-01960 5B

DERMAL ABSORPTION
Simple Method for Estimating Dermal Absorption of Chemicals in Water.
W91-01731 5B

DESALINATION
High Recovery Reverse Osmosis.
W91-01985 3A

DESALINATION WASTES
Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation: Part I. Evaluation of the Physical Properties of Highly Concentrated Brines.
W91-01757 3A

Characterization of Desalting Concentrates.
W91-01976 3A

Historic Development of the Concentrate Regulations.
W91-01977 5G

Current Regulatory Concerns Related to the Disposal of RO Concentrates in Florida.
W91-01978 5G

Surface Water Discharge of Reverse Osmosis Concentrates.
W91-01979 5E

Disposal of Concentrate from Brackish Water Desalting Plants by Use of Deep Injection Wells.
W91-01980 5E

Irrigation with Membrane Plant Concentrate: Fort Myers Case Study.
W91-01981 3C

Use of Solar Ponds in the Disposal of Desalting Concentrate.
W91-01982 5E

Disposal of Concentrates from Brackish Water Desalting Plants by Means of Evaporation Technology.
W91-01983 5E

Reclaiming Reverse Osmosis Blowdown with Electrodialysis Reversal.
W91-01984 5D

High Recovery Reverse Osmosis.
W91-01985 3A

DESERT PLANTS
Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800 2I

DESERTS
Elucidating Ground-Water Flow Paths in a Desert Terrane by Geochemical Methods.
W91-01784 2F

Stability of Periphyton and Macroinvertebrates to Disturbance by Flash Floods in a Desert Stream.
W91-01924 2H

DESIGN CRITERIA
Pressure Sewers Design Considerations and Anticipated Maintenance.
W91-01964 5D

DESIGN STANDARDS
Multi-Model Micro-Computer Based Wet Detention Basin Design Methodology.
W91-01200 4C

DESORPTION
Desorption of Odor Substances from Water Bodies to the Atmosphere.
W91-01282 5G

DESTRATIFICATION
Modeling of Wind-Induced Destratification in Chesapeake Bay.
W91-01899 2L

DETENTION PONDS
Evaluation of Detention Basin Performance in the Piedmont Region of North Carolina.
W91-01824 5G

DETENTION RESERVOIRS
Multi-Model Micro-Computer Based Wet Detention Basin Design Methodology.
W91-01200 4C

Modeling and Field Evaluations of Urban Wet Detention Ponds.
W91-01201 4C

Decontamination of Highway Surface Runoff in the FRG.
W91-02002 5C

DETERGENTS
Indicators of Chemical Pollution from Septic Systems.
W91-01785 5A

DETOXIFICATION
Reduction of Toxic Chromate in an Industrial Effluent by Use of a Chromate-Reducing Strain of Enterobacter Cloacae.
W91-01641 5I

DETRITUS
Effect of Irrigation with Sewage Effluent on Decomposition of Litter in Pinus radiata Forests.
W91-01067 3

Comparison of Detritus Processing Between Permanent and Intermittent Headwater Streams
W91-01744 2

Influence of Debris Flows on Channels and Valley Floors in the Oregon Coast Range, U.S.A.
W91-01882

DEVELOPING COUNTRIES
Marine Reserve Management in Developing Nations: Mida Creek--A Case Study from East Africa.
W91-01121

Strategy for Cost Recovery in the Rural Water Sector: A Case Study of Nsukka District, Anambra State, Nigeria.
W91-01510

Mar del Plata Action Plan: Review of Progress of Implementation in Asia and the Pacific.
W91-01679

Regional Overview of Water Quality Monitoring.
W91-01680

DEW
Chemistry of Dews and Frosts in Indianapolis, Indiana.
W91-01288

DEWATERING
Application of a Hollow-Fiber, Tangential-Flow Device for Sampling Suspended Bacteria and Particles from Natural Waters.
W91-01031 5A

DIAGENESIS
Production and Carbon Isotopic Composition of Bacterial CO2 in Deep Coastal Plain Sediments of South Carolina.
W91-01297 2J

Measurement of CO2-Fixation in Sediments: Some Theoretical and Technical Aspects.
W91-01586 2J

DIALYSIS
Micropollutants in Water Used for Renal Dialysis: An International Perspective.
W91-01227 5C

Aluminum in Domestic Water: Overload May Be Hazardous to Dialysis Patients.
W91-01382 5C

Experimental Use of Dialysis Chamber Arrays to Study P-Fluxes in the Bay of Quinte, 1987.
W91-01796 2H

Interstitial Dissolved Organic Carbon in Sediments of a Southern Appalachian Headwater Stream.
W91-01804 2H

DIATOMS
Variability of Diatom Concentrations and Accumulation Rates in Sediments of a Small Lake Basin.
W91-01049 2H

Colonization Process of a Typical Epilithic Algal Community--Homoeothrix janthina-Achnanthes japonica Community--in a Less Polluted River in Japan (in Japanese).
W91-01383 2H

Algae, Other Than Diatoms, Affecting the Density, Species Richness and Diversity of Diatom Communities in Rivers.
W91-01765 2H

Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

Phytoplankton Biomass and Potential Nutrient Limitation of Phytoplankton Development in the Southeastern North Sea in Spring 1985 and 1986.
W91-01937 2L

ICHLOROBIPHENYLS
Comparative Toxicokinetics of 2,2'-Dichlorobiphenyls and 4,4'-Dichlorobiphenyls in the Pond Snail Lymnaea stagnalis.
W91-02036 5C

IETS
Effects of Diet, Water Hardness, and Population Source on Acute and Chronic Copper Toxicity to Ceriodaphnia dubia.
W91-02024 5C

IFFUSION
Study of Pollutant Diffusion in the Jiujiang Segment of the Changjiang River (in Chinese).
W91-01571 5B

IGESTED SLUDGE
Seasonal Variation of Thermophilic Campylobacters in Sewage Sludge.
W91-01655 5B

DINITROPHENOL
Adsorption, Degradation, and Plant Availability of 2,4-Dinitrophenol in Sludge-Amended Calcareous Soils.
W91-01026 5B

DINOFLAGELLATES
Planktonic Protozoa in Lakes Huron and Michigan: Seasonal Abundance and Composition of Ciliates and Dinoflagellates.
W91-01799 2H

DIOXINS
Yolk Retinoids (Vitamin A) in Eggs of the Herring Gull and Correlations with Polychlorinated Dibenzo-p-dioxins and Dibenzofurans.
W91-01264 5C

Formation of PCDDs and PCDFs by the Chlorination of Water.
W91-01725 5F

Polychlorinated Dibenzofuran (PCDF) and Dibenzo-P-Dioxin (PCDD) Levels in Organisms and Sediments from the Frierfjord, Southern Norway.
W91-01726 5B

Presence of Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans in Fish-Eating Birds and Fish from the Netherlands.
W91-01966 5B

DISINFECTION
Ultraviolet Disinfection of Potable Water.
W91-01179 5F

Interface of Health Effects and Chemistry at Water Treatment Plants.
W91-01226 5F

Micropollutants in Water Used for Renal Dialysis: An International Perspective.
W91-01227 5C

Disinfection and Screening of Sewage to Improve the Quality of Bathing Water at a U.K. Seaside Resort.
W91-01233 5D

Removal of Organohalogens and Organohalogen Precursors in Reclaimed Wastewater--I.
W91-01415 5D

Inactivation of Legionella pneumophila by Potassium Permanganate.
W91-01640 5F

Formation of PCDDs and PCDFs by the Chlorination of Water.
W91-01725 5F

Effects of Ozone on the Infectivity of Hepatitis A Virus.
W91-01771 5F

DISPERSION
Longitudinal Dispersion Processes in the Upper Tamar Estuary.
W91-01127 2L

Computed and Observed Currents, Elevations, and Salinity in a Branching Estuary.
W91-01129 2L

Advection Simulation by Minimax-Characteristics Method.
W91-01496 8B

Analytical Asymptotic Solutions for Longitudinal Dispersion with Dead Zones.
W91-01672 8B

DISPERSIVITY
Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 3. Dispersivity and Model Verification.
W91-01533 2F

DISSOLVED ORGANIC CARBON
Biogeochemistry of Carbon in the Amazon River.
W91-01039 5B

Distribution of Labile Dissolved Organic Carbon in Lake Michigan.
W91-01044 2H

Dissolved Organic Carbon Concentrations and Fluxes Along the Moisie River, Quebec.
W91-01341 2K

Seasonal Changes in the Dissolved Free Amino Acid and DOC Concentrations in a Hypertrophic African Reservoir and Its Inflowing Rivers.
W91-01356 2H

Carbon Flux from Phytoplankton to Free-Living Bacterial DNA.
W91-01591 2H

Fate of Phytoplankton Primary Production: Losses in Relation to Bacterial Metabolism in a Eutrophic Shallow Lake.
W91-01593 2K

Production and Utilization of Organic Matter by Microplankton in an Eutrophic Lake.
W91-01594 2H

Interstitial Dissolved Organic Carbon in Sediments of a Southern Appalachian Headwater Stream.
W91-01804 2H

DISSOLVED ORGANIC MATTER
Inhibitory Effects of High Molecular Weight Dissolved Organic Matter Upon Metabolic Processes in Biofilms from Contrasting Rivers and Streams.
W91-01345 2K

Distribution of Short Chain Carboxylic Acids in Eutrophic Drainage Channels.
W91-01359 5B

DISSOLVED OXYGEN
Effects of Climate Warming on Dissolved Oxygen Concentrations in Lake Erie.
W91-01391 2H

Contribution of Benthic Biomass to Overall Metabolism in New Caledonia Lagoon Sediments.
W91-01659 2L

Measurement and Interpretation of Low Levels of Dissolved Oxygen in Ground Water.
W91-01788 7B

DISSOLVED SOLIDS
Dissolved and Suspended Solids Transport from Coastal Plain Watersheds.
W91-01011 5B

Copper Toxicity to Paratya australiensis: III. Influence of Dissolved Organic Matter.
W91-01260 5C

Algal Exudation and Its Relation to Bacterial Production During Vernal Phytoplankton Blooms.
W91-01592 2H

Clay, Dissolved Organic Matter, and Bacterial Interactions in Two Reservoirs.
W91-01600 2H

Contribution of Benthic Biomass to Overall Metabolism in New Caledonia Lagoon Sediments.
W91-01659 2L

Association of Benzo(a)Pyrene with Dissolved Organic Matter: Prediction of K(dom) from Structural and Chemical Properties of the Organic Matter.
W91-01727 5B

LIBRARY U. OF I. URBANA-CHAMPAIGN

DISTRIBUTION
Lognormal Distribution of Radon Concentration in Ground Water.
W91-01294 5B

DISTRIBUTION PATTERNS
Climatic Control of Vegetation Distribution: The Role of the Water Balance.
W91-01684 2B

DISTRICT OF COLUMBIA
Use of SWMM/EXTRAN and TR-20 to Develop Regional Stormwater Detention Plans in the Washington, D.C. Region.
W91-01196 4C

DITCHES
Spirogyra Species and Accompanying Algae from Pools and Ditches in The Netherlands.
W91-01333 5C

DIURNAL VARIATION
Diurnal Variations in the Inorganic Solute Content of Water Draining from an Alpine Snowpatch.
W91-01083 2K

Diel Variations in Photosynthetic Activity of Summer Phytoplankton in Lindaspollene, Western Norway.
W91-01930 2L

DIVERSION STRUCTURES
Investigation of the Diversion Outlet of the Kirzan Hydro Development.
W91-01646 8B

DNA
Carbon Flux from Phytoplankton to Free-Living Bacterial DNA.
W91-01591 2H

DOMESTIC WATER
Biofilms: Detection, Implications and Solutions.
W91-01239 5F

Investigation into the Performance Characteristics of Boundary Boxes Subjected to Vertical Loading.
W91-01269 8B

Aluminum in Domestic Water: Overload May Be Hazardous to Dialysis Patients.
W91-01382 5C

Strategy for Cost Recovery in the Rural Water Sector: A Case Study of Nsukka District, Anambra State, Nigeria.
W91-01510 6C

Inhibition of Growth of Legionella Species by Heterotrophic Plate Count Bacteria Isolated from Chlorinated Drinking Water.
W91-01665 5F

DOSIMETRY
Evaluation of Biologically Harmful Ultraviolet Radiation in Antarctica with a Biological Dosimeter Designed for Aquatic Environments.
W91-01138 7B

DOUGLAS CREEK
Redd Site Selection by Brown Trout in Douglas Creek, Wyoming.
W91-01745 8I

DRAINAGE
Nitrate Leaching from Systematically Tiled Potato Fields in New Brunswick, Canada.
W91-01016 5B

Diurnal Variations in the Inorganic Solute Content of Water Draining from an Alpine Snowpatch.
W91-01083 2K

DRAINAGE AREA
Spatial Scale Dependence of Sediment Dynamics in a Semi-Arid Badland Drainage Basin.
W91-01085 2J

Pollutants Attached to Particles from Drainage Areas.
W91-01996 5B

DRAINAGE CANALS
Distribution of Short Chain Carboxylic Acids in Eutrophic Drainage Channels.
W91-01359 5B

DRAINAGE PATTERNS
Theoretical Model of Optimal Drainage Networks.
W91-01526 2E

DRAINAGE SYSTEMS
Computer Aided Planning of Drainageway Improvements Made Easy with LOTUS 1-2-3.
W91-01205 7C

DRAINAGE WATER
Release of Cationic Aluminium from Acidic Soils into Drainage Water and Relationships with Land Use.
W91-01479 5B

DRAWDOWN
Predicting Well Drawdown During Prolonged Pumping.
W91-01682 4B

DREDGING WASTES
Consolidation and Contaminant Migration in a Capped Dredged Material Deposit.
W91-01453 5E

DRILLING FLUIDS
Drilling Fluids and the Arctic Tundra of Alaska: Assessing Contamination of Wetlands Habitat and the Toxicity to Aquatic Invertebrates and Fish.
W91-01975 5B

DRINKING WATER
Household Exposure Models.
W91-01076 5C

Ultraviolet Disinfection of Potable Water.
W91-01179 5F

Recovery of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone from Water Samples on XAD Resins and the Effect of Chlorine on Its Mutagenicity.
W91-01181 5A

Well-Water Methaemoglobinaemia: The Bacterial Factor.
W91-01224 5C

Interface of Health Effects and Chemistry at Water Treatment Plants.
W91-01226 5F

Clinical and Environmental Effects of a Major Emergency Involving Public Water Supply.
W91-01228 5G

Biofilms: Detection, Implications and Solutions.
W91-01239 5F

Advanced Nitrogen Removal Processes for Drinking and Waste Water Treatment.
W91-01247 5D

Triazine and Chloroacetamide Herbicides in Sydenham River Water and Municipal Drinking Water, Dresden, Ontario, Canada, 1981-1987.
W91-01306 5B

Lithium in Drinking Water and the Incidences of Crimes, Suicides, and Arrests Related to Drug Addictions.
W91-01483 5F

Occurrence of the Mutagenic Compound MX in Drinking Water and Its Removal by Activated Carbon.
W91-01643 5F

Lack of Effect of Drinking Water Barium on Cardiovascular Risk Factors.
W91-01666 5F

Exchangeable Immobilized Enzyme Reactor for Enzyme Inhibition Tests in Flow-Injection Analysis Using a Magnetic Device. Determination of Pesticides in Drinking Water.
W91-01710 5A

Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation: Part I. Evaluation of the Physical Properties of Highly Concentrated Brines.
W91-01757 3A

Determination of Volatile Organics in Drinking Water with USEPA Method 524.2 and the Ion Trap Detector.
W91-01915 5F

Comprehensive Health Effects Testing Program for Denver's Potable Water Reuse Demonstration Project.
W91-01920 5D

Risk Assessment of Drinking Water in a Reservoir Contaminated by PAHs Originated from Road Traffic.
W91-01991 5C

DROUGHT
Physiological Response of Yellow-Poplar Seedlings to Simulated Acid Rain, Ozone Fumigation, and Drought.
W91-01068 5C

Practical Aspects of Low-Flow Frequency Analysis.
W91-01529 2E

Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800 2

Blanket Peat Erosion in a Mid-Wales Catchment During Two Drought Years.
W91-01881 2

DROUGHT EFFECTS
Decadal-Scale Changes of the Circulation in the Tropical Atlantic Sector Associated with Sahel Drought.
W91-01465 2

Discharge-Export Relationships in Headwater Streams: The Influence of Invertebrate Manipulations and Drought.
W91-01925 2

DROUGHT RESISTANCE
Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800

New Gene Sources for Development of Agronomic Plants with Tolerance to Drought and Other Abiotic Stresses.
W91-01859

DRY DEPOSITION
Dry Deposition of Sulfur: a 23-Year Record for the Hubbard Brook Forest Ecosystem.
W91-01411

DUCKS
Selenium Accumulation and Elimination in Mallards.
W91-01314

Acid Precipitation and Food Quality: Inhibition of Growth and Survival in Black Ducks

Mallards by Dietary Aluminum, Calcium, and Phosphorus.
W91-01320 5C

Effects of Ingested Crude Oil on Thyroid Hormones and on the Mixed Function Oxidase System in Ducks.
W91-01775 5C

DUCKWEED
Economic Considerations in Wastewater Treatment with Duckweed for Effluent and Nitrogen Renovation.
W91-01176 5D

DUNES
Modelling of Sandwave Evolution Resulting from Suspended and Bed Load Transport of Sediment.
W91-01675 8B

Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695 2J

DYE INDUSTRY WASTES
Nonpriority Analysis of the Wastewater Streams of Four Dye Manufacturing Facilities.
W91-01172 5A

DYES
Effect of 3,4-Dichloroaniline and Metavanadate on Daphnia Populations.
W91-01326 5C

Structure-Toxicity Relationships for Selected Weak Acid Respiratory Uncouplers.
W91-01364 5C

Comparative Toxicity of Solvent Yellow 33 (2-(2'-Quinolinyl)-1,3-Indandione) and Solvent Green 3 (1,4-Di-p-Toluidino-Anthraquinone) Dyes to Freshwater Organisms.
W91-01730 5C

DYSTROPHIC LAKES
Heat Contents, Thermal Stabilities and Birgean Wind Work in Dystrophic Tasmanian Lakes and Reservoirs.
W91-02043 2H

ECHINODERMS
Paraffin Hydrocarbons in the Gonads of the Sea Urchin Strongylocentrotus nudus Normally and after Exposure to Diesel Oil (in Russian).
W91-01456 5B

ECOLOGICAL EFFECTS
Assessment of Cumulative Impacts to Water Quality in a Forested Wetland Landscape.
W91-01017 4C

Environmental Impacts of Development on Wetlands in Arid and Semi-arid Lands.
W91-01462 6G

Hydroelectric Dams and the Decline of Chinook Salmon in the Columbia River Basin.
W91-01560 6G

Effect of Tidal Flooding on Mortality of Juvenile Muskrats.
W91-01910 2L

ECOLOGY
Climatic Control of Vegetation Distribution: The Role of the Water Balance.
W91-01684 2B

ECONOMIC ASPECTS
Economic Considerations in Wastewater Treatment with Duckweed for Effluent and Nitrogen Renovation.
W91-01176 5D

Strategy for Cost Recovery in the Rural Water Sector: A Case Study of Nsukka District, Anambra State, Nigeria.
W91-01510 6C

Proposed EPA Sludge Disposal Regulations: Project Purgatory.
W91-01676 5E

ECONOMIC EVALUATION
Possibilities of Constructing Hydroelectric Stations: Pumped Storage Stations in Armenia.
W91-01439 8C

ECOSYSTEMS
Importance of Natural Processes in Understanding Ecosystem Change: A Case Study of Limed Lakes.
W91-01073 2H

Ecological Relationships of Wild Rice, Zizania aquatica. 9. Production in Organic-Flocculent Sediments.
W91-01373 2H

Climate Change and Fish Communities: A Conceptual Framework.
W91-01401 8I

Influence of Temperature Changes on Aquatic Ecosystems: An Interpretation of Empirical Data.
W91-01403 2B

Environmental Impacts of Development on Wetlands in Arid and Semi-arid Lands.
W91-01462 6G

Dynamics of Pelagic Ciliates in Eutrophic Estuarine Waters: Importance of Functional Groups among Ciliates and Responses to Bacterial and Phytoplankton Production.
W91-01613 2L

Relationship Between Water Quality and Caddisfly Assemblage Structure in Fast-Running Rivers. The River Cadagua Basin.
W91-01697 5A

Fate and Effects of Pulp Mill Chlorophenolic 4,5,6-Trichloroguaiacol in a Model Brackish Water Ecosystem.
W91-01816 5B

Food Habits of Two Larval Flies (Dolichopodidae: Diptera) in Two Gulf Coast Oligohaline Tidal Marshes.
W91-01911 2L

Ecological Mechanisms Important for the Biotic Changes in Acidified Lakes in Scandinavia.
W91-02015 5C

Effects of Short-term Pulses of Atrazine on Attached Algal Communities in a Small Stream.
W91-02040 5C

EDDIES
Properties of Unstable Waves in the Lower St. Lawrence Estuary.
W91-01431 2L

EEL
Metabolic Effects of Kraft Mill Effluents on the Eel Anguilla anguilla L.
W91-01323 5C

Mercury, Cadmium and Lead in Eels and Roach: The Effects of Size, Season, and Locality on Metal Concentrations in Flesh and Liver.

W91-01733 5B

Kinetic Study of the Decomposition of Methyl (1-(Butylcarbamoyl)-1H-benzimidazol-2-yl)carbamate (Benomyl) to Methyl 1H-Benzimidazol-2-ylcarbamate (MBC).
W91-01739 5B

Effects of Organic Substrates on Dechlorination of Aroclor 1242 in Anaerobic Sediments.
W91-01758 5B

Effect of Sulfate and Organic Carbon Supplements on Reductive Dehalogenation of Chloroanilines in Anaerobic Aquifer Slurries.
W91-01760 5B

Degradation of Phenol by a Bacterial Consortium Under Methanogenic Conditions.
W91-01773 5D

Natural Bioremediation of Organic Contaminants in Ground Water: Cliffs-Dow Superfund Site.
W91-01782 5B

Modeling the Fate and Transport of Organic Contaminants in Lake St. Clair.
W91-01792 5B

Volatilization of Selenium from Agricultural Evaporation Pond Sediments.
W91-01814 5G

Pollution by the Fungicide Pentachloronitrobenzene in an Intensive Farming Area in Japan.
W91-01815 5B

Inorganic and Organic Ground-Water Chemistry in the Canal Creek Area of Aberdeen Proving Ground, Maryland.
W91-01837 5B

Denitrification and Nitrous Oxide in the North Sea.
W91-01935 5B

Utilization of Hydrocarbon Substrates by Heavy Oil-degrading Bacteria Isolated from the Sea Water of Oil-Polluted Bisan Seto.
W91-01945 5G

Rapid Dissipation of Glyphosate in Small Forest Ponds.
W91-02018 5B

FATS

Conversion of Fat into Yeast Biomass in Protein-Containing Waste-Water.
W91-01717 5D

FATTY ACIDS

Effects of Herbivore Type and Density on Chemical Composition of Algal Assemblages in Laboratory Streams.
W91-01807 2H

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

Application of Multivariate Analysis for Characterization of Organic Compounds from Urban Runoff.
W91-02004 5A

FEDERAL JURISDICTION

Federal-State Tensions in Australian Environmental Management: The World Heritage Issue.
W91-01102 6G

Queensland Rainforest and Wetlands Conflict: Australia's External Affairs Power--Domestic Control and International Conservation.
W91-01104 6E

In Re Water of Hallett Creek System.

FEED FORWARD METHOD

Solute Transport with Multisegment, Equilibrium-Controlled Reactions: A Feed Forward Simulation Method.
W91-01520 5B

FEEDLOT WASTES

Wastes From Animal Breeding: Water Quality Standards in an Integrated Perspective of Treatment and Valorization for Portugal and Southern Europe.
W91-01248 5D

FEEDWATER TREATMENT

High Recovery Reverse Osmosis.
W91-01985 3A

FENITROTHION

Comparative Study on the Toxicity, Absorption and Depuration of Fenitrothion and Its Oxon in Japanese Tiger Shrimp.
W91-01960 5B

FENS

Methane Emissions from Fen, Bog and Swamp Peatlands in Quebec.
W91-01719 5B

Spatial and Temporal Patterns in the Hydrogeochemistry of a Poor Fen in Northern Wisconsin.
W91-01720 2H

FERTILIZATION

Water and Fertilizer Interrelations with Irrigated Maize.
W91-01408 3F

FERTILIZERS

Agriculture: A Positive Contribution to Water Quality.
W91-01249 5G

Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

Calibration and Validation of a Model of Non-Interactive Solute Leaching in a Clay-Loam Arable Soil.
W91-01477 7C

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: II. Production and Income.
W91-01504 5E

FIELD TESTS

Modeling and Field Evaluations of Urban We Detention Ponds.
W91-01201 4C

Field Evaluation of In-Situ Biodegradation o Chlorinated Ethenes: Part I, Methodology an Field Site Characterization.
W91-01789 5C

Sampling Strategies for Parameter Estimation i Groundwater Quality Management: Theory an Field Validation.
W91-01866 5A

FILTRATION
Application of a Hollow-Fiber, Tangential-Flow Device for Sampling Suspended Bacteria and Particles from Natural Waters.
W91-01031 5A

Mechanisms of Compressible Sludge Cake Shrinkage.
W91-01150 5D

Borough of Huntingdon Upgrades Its Wastewater Treatment Facilities.
W91-01677 5D

FINITE DIFFERENCE METHODS
Advection Simulation by Minimax-Characteristics Method.
W91-01496 8B

FINITE ELEMENT METHOD
Seepage in Earth Dams in Two- and Three-Dimensional Formulations of the Problem.
W91-01650 8D

FINLAND
Effects of Acidic Irrigation on Soil Microorganisms at Kevo, Northern Finland.
W91-01109 5C

Isolation and Characterization of Hepatotoxic Microcystin Homologs from the Filamentous Freshwater Cyanobacterium Nostoc sp. Strain 152.
W91-01761 2H

FISH
Effect of Body Size on the Uptake and Bioconcentration of Di-2-Ethylhexyl Phthalate in Rainbow Trout.
W91-01257 5B

Species-Specific Reaction of Liver Ultrastructure in Zebrafish (Brachydanio rerio) and Trout (Salmo gairdneri) after Prolonged Exposure to 4-Chloroaniline.
W91-01317 5C

Molluscicidal and Piscicidal Properties of Copper(II) Tetraoxosulfate(VI) on Bulinus globosus (Morelet) and Clarias anguillaris (L).
W91-01363 5C

Fish Health and Environmental Health.
W91-01376 5C

New Approach for Measuring Cover in Fish Habitat Studies.
W91-01746 2H

Spatial and Temporal Dispersion Patterns of Golden Perch, Macquaria ambigua, Larvae in an Artificial Floodplain Environment.
W91-01957 2H

Zinc and Copper in Fish from Natural Waters and Rearing Ponds in Northern Italy.
W91-01958 5B

Effects of Sample Preparation on Measured Concentrations of Eight Elements in Edible Tissues of Fish from Streams Contaminated by Lead Mining.
W91-01968 5A

Toxicity of Five Shale Oils to Fish and Aquatic Invertebrates.
W91-01971 5C

Drilling Fluids and the Arctic Tundra of Alaska: Assessing Contamination of Wetlands Habitat and the Toxicity to Aquatic Invertebrates and Fish.
W91-01975 5B

Geographic Variation of Chlorinated Hydrocarbons in Burbot (Lota lota) from Remote Lakes and Rivers in Canada.
W91-02033 5B

Comparative Toxicities of Selected Industrial Chemicals to Microorganisms and Other Aquatic Organisms.
W91-02041 5C

FISH BEHAVIOR
Behavioral Indicators of Sublethal Toxicity in Rainbow Trout.
W91-01315 5C

Temperature Selection by Striped Bass in a Gulf of Mexico Coastal River System.
W91-01385 8I

Redd Site Selection by Brown Trout in Douglas Creek, Wyoming.
W91-01745 8I

FISH CONSERVATION
Accommodating Fish and Wildlife Interests under the FPA.
W91-01628 6E

FISH DIETS
Comparison of the Diets of Gulf Killifish, Fundulus grandis Baird and Girard, Entering and Leaving a Mississippi Brackish Marsh.
W91-01909 2L

FISH EGGS
Effects of Low pH on the Chorion of Rainbow Trout, Oncorhynchus mykiss, and Brown Trout, Salmo trutta f. fario.
W91-01959 5C

FISH FOOD
Growth and Value of Chlorella salina Grown on Highly Saline Sewage Effluent.
W91-01708 5D

FISH GROWTH
Potential Effects of Global Climate Warming on the Growth and Prey Consumption of Great Lakes Fish.
W91-01395 2B

FISH HATCHERIES
Effect of Hardness and Salinity on Survival of Striped Bass Larvae.
W91-01386 8I

FISH LARVAE
Effect of Hardness and Salinity on Survival of Striped Bass Larvae.
W91-01386 8I

FISH MANAGEMENT
Mechanical Equipment of the Tikhovsk Hydro Development on the Kuban River.
W91-01540 8C

FISH MIGRATION
Evaluation of Designs of Periodic Count Surveys for the Estimation of Escapement at a Fishway.
W91-01384 7A

Abundance of Spawning Pacific Salmon in Two Lake Superior Streams, 1981-1987.
W91-01791 8I

FISH PASSAGES
Mechanical Equipment of the Tikhovsk Hydro Development on the Kuban River.
W91-01540 8C

Abundance of Spawning Pacific Salmon in Two Lake Superior Streams, 1981-1987.
W91-01791 8I

FISH PHYSIOLOGY
Use of a Compartmental Model to Develop Rules for the Interpretation of Water Quality Data.
W91-01214 5B

Effect of Body Size on the Uptake and Bioconcentration of Di-2-Ethylhexyl Phthalate in Rainbow Trout.
W91-01257 5B

Interaction of Carbon Tetrachloride with Beta-Naphthoflavone-Mediated Cytochrome P450 Induction in Winter Flounder (Pseudopleuronectes americanus).
W91-01279 5C

Induction of Peroxisome Proliferation in Rainbow Trout Exposed to Ciprofibrate.
W91-01280 5C

Influence of Cadmium and Zinc on Cadmium Turnover in the Zebrafish, Brachydanio rerio.
W91-01310 5C

Acute Toxicity of Boron, Molybdenum, and Selenium to Fry of Chinook Salmon and Coho Salmon.
W91-01313 5C

Species-Specific Reaction of Liver Ultrastructure in Zebrafish (Brachydanio rerio) and Trout (Salmo gairdneri) after Prolonged Exposure to 4-Chloroaniline.
W91-01317 5C

Long-Term Toxicity Test Comprising Reproduction and Growth of Zebrafish with 4-Chloroaniline.
W91-01318 5C

Effect of pH on the Accumulation Kinetics of Pentachlorophenol in Goldfish.
W91-01321 5B

Metabolic Effects of Kraft Mill Effluents on the Eel Anguilla anguilla L.
W91-01323 5C

Incorporation of a Subacute Test with Zebra Fish into a Hierarchical System for Evaluating the Effect of Toxicants in the Aquatic Environment.
W91-01327 5C

Effect of Cadmium on Vitellogenin Metabolism in Estradiol-Induced Flounder (Platichthys flesus (L.)) Males and Females.
W91-01365 5C

Induction of Hepatic Mixed-Function Oxidase of the Mullet, Mugil so-iuy by Crude Oil (in Chinese).
W91-01573 5C

Observations on Overwintering Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) Exposed to Bleached Kraft Mill Effluent in the Upper Fraser River, British Columbia.
W91-01724 5B

Uranium and Thorium in Muscle Tissue of Fish Taken from the Southern Baltic.
W91-01922 5B

Effect of Waterborne and Dietary Cadmium on Plasma Ions of the Teleost Oreochromis mossambicus in Relation to Water Calcium Levels.
W91-02022 5C

Uptake and Elimination of Waterborne Cadmium by the Fish Noemacheilus barbatulus L. (Stone Loach).
W91-02023 5C

Effects of Paraquat on Mortality and Cardiorespiratory Function of Catfish Fry Plecostomus commersoni.
W91-02032 5C

Sublethal and Acute Toxicity of the Ethylene Glycol Butyl Ether Ester Formulation of Triclo-

LIBRARY U. OF L. URBANA-CHAMP

pyr to Juvenile Coho Salmon (Oncorhynchus kisutch).
W91-02039 5C

FISH PONDS
Numbers and Activity of Bacterioplankton in Various Types of Waters in Czechoslovakia: Relations to Chlorophyll Concentration.
W91-01610 2H

FISH POPULATIONS
Mangrove Ecology, Aquatic Primary Productivity, and Fish Community Dynamics in the Teacapan-Agua Brava Lagoon-Estuarine System (Mexican Pacific).
W91-01137 2H

Survival of Early Life Stages of Brown Trout (Salmo trutta L.) in Relation to Aluminium Speciation in Upland Welsh Streams.
W91-01362 5C

Relations Between Brook Trout Standing Stocks and Habitat Features in Beaver Ponds in Southeastern Wyoming.
W91-01387 8I

Potential Effects of Global Climate Warming on the Growth and Prey Consumption of Great Lakes Fish.
W91-01395 2B

Effect of Air Temperature on Growth of Largemouth Bass in North America.
W91-01396 2H

Potential Loss of Thermal Habitat for Brook Trout, Due to Climatic Warming, in Two Southern Ontario Streams.
W91-01397 8I

Size-Dependent Winter Mortality of Young-of-the-Year White Perch: Climate Warming and Invasion of the Laurentian Great Lakes.
W91-01399 8I

Climate, Population Viability, and the Zoogeography of Temperate Fishes.
W91-01400 2B

Climate Change and Fish Communities: A Conceptual Framework.
W91-01401 8I

Estimation of Recruitment Forgone Resulting from Larval Fish Entrainment.
W91-01794 6G

Acidification in Norway - Loss of Fish Populations and the 1000 Lake Survey 1986.
W91-01889 5C

FISHERIES
Potential Application of Models in Forecasting the Effects of Climate Changes on Fisheries.
W91-01392 2B

Potential Changes in the Thermal Habitat of Great Lakes Fish after Global Climate Warming.
W91-01394 2B

Single-Stage and Two-Stage Decision Modeling of the Recreational Demand for Water.
W91-01699 6D

FISHERIES MANAGEMENT
Climate Change and Fish Communities: A Conceptual Framework.
W91-01401 8I

Implications of Climate Change for Fisheries Management Policy.
W91-01402 8I

FISHKILL
Integration of Long-Term Fish Kill Data with Ambient Water Quality Monitoring Data and Application to Water Quality Management.
W91-01635 5C

Acidification in Norway - Loss of Fish Populations and the 1000 Lake Survey 1986.
W91-01889 5C

FJORDS
Polychlorinated Dibenzofuran (PCDF) and Dibenzo-P-Dioxin (PCDD) Levels in Organisms and Sediments from the Frierfjord, Southern Norway.
W91-01726 5B

Pelagic Metabolism in Eutrophic Waters During a Late Summer Period.
W91-01929 2L

Diel Variations in Photosynthetic Activity of Summer Phytoplankton in Lindaspollene, Western Norway.
W91-01930 2L

FLAGELLATES
Uptake of Bacteria-Sized Fluorescent Particles by Natural Protozoan Assemblage in a Reservoir.
W91-01617 2H

Rates of Protozoan Bacterivory in Three Habitats of a Southeastern Blackwater River.
W91-01809 2H

FLIES
Food Habits of Two Larval Flies (Dolichopodidae: Diptera) in Two Gulf Coast Oligohaline Tidal Marshes.
W91-01911 2L

FLOATING PLANTS
Nutrient Dynamics in a Floating Mat and Pond System with Special Reference to Its Vegetation.
W91-01126 2H

FLOCCULATION
Water Treatment Technology for Removing Pesticides From Water.
W91-01252 5F

Control of Sludge Settling Characteristics in the Single-Sludge System, A Hypothesis.
W91-01427 5D

Microbiology of Foaming in Activated Sludge Plants.
W91-01654 5D

Flocculation in Turbulent Flow: Measurement and Modeling of Particle Size Distributions.
W91-01752 5F

FLOOD CONTROL
Unit-Hydrograph Procedures for Arid Lands.
W91-01208 7C

Bearspaw Development: Design and Construction of a Side-Channel Overflow Spillway.
W91-01721 8B

FLOOD FORECASTING
Prediction Model for Snowmelt, Snow Surface Temperature and Freezing Depth Using a Heat Balance Method.
W91-01469 2C

FLOOD FREQUENCY
Flood of October 1983 and History of Flooding Along the San Francisco River, Clifton, Arizona.
W91-01849 2E

FLOOD HYDROGRAPHS
Flood Hydrograph for Ungaged Watershed.
W91-01207 7C

FLOOD PEAK
Problems in Determining the Return of a Watershed to Pretreatment Conditions: Techniques Applied to a Study at Caspar Creek, California.
W91-01523 4C

Flood of October 1983 and History of Flooding Along the San Francisco River, Clifton, Arizona.
W91-01849 2E

FLOOD PLAIN MANAGEMENT
Urban Runoff Modeling for Administrative Purposes.
W91-01193 4C

FLOOD PLAIN SEDIMENTS
Chemical and Physical Speciation of Trace Metals in Fine Grained Overbank Flood Sediments in the Tyne Basin, North-East England.
W91-01082 5B

FLOOD PLAINS
Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

Spatial and Temporal Dispersion Patterns of Golden Perch, Macquaria ambigua, Larvae in an Artificial Floodplain Environment.
W91-01957 2H

FLOOD ROUTING
Determination of Designated Floodway Boundaries Around Long Islands in Stream Channels.
W91-01209 2E

Gulf Coast Flood Routing.
W91-01210 2E

FLOODWATER
Channel Avulsion and River Metamorphosis: The Case of the Thomson River, Victoria, Australia.
W91-01879 2E

FLORA
Lakeshore Swamps of Bositeng Lake in the Xinjiang Autonomous Region (in Chinese).
W91-01569 2H

FLORIDA
Ozonation at Belle Glade, Florida: A Case History.
W91-01169 5F

Calculation and Uncertainty Analysis of Pb21(Dates for PIRLA Project Lake Sediment Cores
W91-01501 2F

Vegetation Dynamics in Impounded Marshe Along the Indian River Lagoon, Florida, USA
W91-01636 4(

Distribution and Rate of Methane Oxidation i Sediments of the Florida Everglades.
W91-01763 2F

Sources and Distribution of Nitrate in Groun Water at a Farmed Field Irrigated with Sewag Treatment-Plant Effluent, Tallahassee, Florid
W91-01857 5

Interpretation of Metal Concentrations in Estu rine Sediments of Florida Using Aluminum as Reference Element.
W91-01898 2

Historic Development of the Concentrate Reg lations.
W91-01977 5

Current Regulatory Concerns Related to tl Disposal of RO Concentrates in Florida.
W91-01978 5

Surface Water Discharge of Reverse Osmosis Concentrates.
W91-01979 5E

Disposal of Concentrate from Brackish Water Desalting Plants by Use of Deep Injection Wells.
W91-01980 5E

FLOUNDERS
Interaction of Carbon Tetrachloride with Beta-Naphthoflavone-Mediated Cytochrome P450 Induction in Winter Flounder (Pseudopleuronectes americanus).
W91-01279 5C

Effect of Cadmium on Vitellogenin Metabolism in Estradiol-Induced Flounder (Platichthys flesus (L.)) Males and Females.
W91-01365 5C

FLOW
Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

FLOW AROUND OBJECTS
Determination of Designated Floodway Boundaries Around Long Islands in Stream Channels.
W91-01209 2E

FLOW CHANNELS
Suspension and Settlement of Particles in Flowing Water: Comparison of the Effects of varying water depth and velocity in Circulating Channels.
W91-01340 2J

FLOW CHARACTERISTICS
Some Parameters of a Spreading Flow Beyond Pipe Conduits.
W91-01437 8B

Local Energy Losses in Two-Component Pressure FLows.
W91-01648 8B

FLOW DISCHARGE
Diurnal Variations in the Inorganic Solute Content of Water Draining from an Alpine Snowpatch.
W91-01083 2K

Discharge-Export Relationships in Headwater Streams: The Influence of Invertebrate Manipulations and Drought.
W91-01925 2H

FLOW EQUATIONS
Experimental Testing of Transient Unsaturated Flow Theory at Low Water Content in a Centrifugal Field.
W91-01514 2G

Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 1. Review of Theory and Verification.
W91-01524 2F

Practical Aspects of Low-Flow Frequency Analysis.
W91-01529 2E

Optimal Artificial Recharge in Intermittent Multibasin System.
W91-01554 4B

FLOW FRICTION
Flow Stability and Friction Factor in Rough Channels.
W91-01494 8B

Local Energy Losses in Two-Component Pressure FLows.
W91-01648 8B

FLOW-INJECTION ANALYSIS
Exchangeable Immobilized Enzyme Reactor for Enzyme Inhibition Tests in Flow-Injection Analysis Using a Magnetic Device. Determination of Pesticides in Drinking Water.
W91-01710 5A

FLOW MODELS
Identifying Flow Paths in Models of Surface Water Acidification.
W91-01033 5B

Some Parameters of a Spreading Flow Beyond Pipe Conduits.
W91-01437 8B

Three-Dimensional Computation of Flow and Bed Deformation.
W91-01493 2J

Flow Stability and Friction Factor in Rough Channels.
W91-01494 8B

Dimensionless Straight-Type Lines for Aquifer Tests.
W91-01497 2F

Solving Groundwater Flow Problems by Conjugate-Gradient Methods and the Strongly Implicit Procedure.
W91-01515 2F

Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 2. Application and Implications for Modeling Strategy.
W91-01525 2F

Prioritizing Flow Alternatives for Social Objectives.
W91-01552 6G

Well Location in Capture Zone Design Using Simulation and Optimization Techniques.
W91-01778 5G

FLOW PROFILES
Improvements to Surcharge Calculations in EXTRAN.
W91-01192 7C

FLOW RESISTANCE
Local Energy Losses in Two-Component Pressure FLows.
W91-01648 8B

FLOW VELOCITY
Suspension and Settlement of Particles in Flowing Water: Comparison of the Effects of varying water depth and velocity in Circulating Channels.
W91-01340 2J

Dual Water Flow Pattern in the Unsaturated Zone under a Gypsum-amended Soil.
W91-01475 2G

Seepage in Earth Dams in Two- and Three-Dimensional Formulations of the Problem.
W91-01650 8D

Travel Times of Seepage Water Through Multilayered Covering Systems for Hazardous Waste Sites.
W91-01886 5B

FLUID DYNAMICS
Properties of Unstable Waves in the Lower St. Lawrence Estuary.
W91-01431 2L

FLUIDIZED BED PROCESS
Measuring Techniques for Gas/Solid Fluidized Bed Reactors (MeBtechniken fur Gas/Feststoff-Wirbelschichtreaktoren).
W91-01896 5D

FLUIDIZED BEDS
Autothermal Fluid Bed for Sludge Incineration.
W91-01244 5E

FLUMES
Long Flume Study of the Dynamic Factors Affecting the Resistance of a Loamy Soil to Concentrated Flow Erosion.
W91-01878 2J

FLUORANTHENE
Toxicity of Fluoranthene in Sediment to Marine Amphipods: A Test of the Equilibrium Partitioning Approach to Sediment Quality Criteria.
W91-01265 5C

FLUORESCENCE
Liquid Chromatographic Method with Fluorescence Detection for the Determination of Polycyclic Aromatic Hydrocarbons in Environmental Samples.
W91-01714 5A

Failure of a Diagnostic Monoclonal Immunofluorescent Reagent to Detect Legionella pneumophila in Environmental Samples.
W91-01764 5A

Indicators of Chemical Pollution from Septic Systems.
W91-01785 5A

FLUORINE
Study on Geochemistry and Geochemical Classification of Elements B, F, Rb and Sr in Yellow Sea (Huang Hai) Sediments.
W91-01566 2J

FLUVIAL SEDIMENTS
Studies on the Chemistry of Interstitial Water Taken from Defined Horizons in the Fine Sediments of Bivalve Habitats in Several Northern German Lowland Waters: I. Sampling Techniques.
W91-01768 2H

FLY ASH
Buffering Capacity of Coal Mine Spoils and Fly Ash as a Factor in the Protection of the Aquatic Environment.
W91-01455 5G

FLYSCH
Variability and Dynamics of Leaching of the Flysch Carpathian Slope.
W91-01078 2G

FOAMING
Microbiology of Foaming in Activated Sludge Plants.
W91-01654 5D

FOG
Chemistry of Carbonyl Compounds in Po Valley Fog Water.
W91-01451 5B

FOGWATER CHEMISTRY
Chemistry of Carbonyl Compounds in Po Valley Fog Water.
W91-01451 5B

FOOD CHAINS
Leaching of Radionuclides from Decaying Blueberry Leaves: Relative Rate Independent of Concentration.
W91-01018 5B

Periodic Bacterivore Activity Balances Bacterial Growth in the Marine Environment.
W91-01037 2L

Potential Effects of Global Climate Warming on the Growth and Prey Consumption of Great Lakes Fish.
W91-01395 2B

LIBRARY U. OF I. URBANA-CHAMP.

FOOD CHAINS

Trophic Relation in the Microzooplankton Community.
W91-01615 2H

Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

Uptake of Bacteria-Sized Fluorescent Particles by Natural Protozoan Assemblage in a Reservoir.
W91-01617 2H

Rates of Protozoan Bacterivory in Three Habitats of a Southeastern Blackwater River.
W91-01809 2H

Pentachlorophenol: Environmental Partitioning and Human Exposure.
W91-02016 5B

FOOD HABITS

Dynamics of Pelagic Ciliates in Eutrophic Estuarine Waters: Importance of Functional Groups among Ciliates and Responses to Bacterial and Phytoplankton Production.
W91-01613 2L

Food Habits of Two Larval Flies (Dolichopodidae: Diptera) in Two Gulf Coast Oligohaline Tidal Marshes.
W91-01911 2L

FOREST ECOSYSTEMS

Assessment of Cumulative Impacts to Water Quality in a Forested Wetland Landscape.
W91-01017 4C

Variability of Mangrove Ecosystems Along the Brazilian Coast.
W91-01136 2L

Forests and the Temperature of Upland Streams in Wales: A Modelling Exploration of the Biological Effects.
W91-01343 2E

FOREST FIRES

Humus Form Development and Hillslope Runoff, and the Effect of Fire and Management, Under Mediterranean Forest in NE-Spain.
W91-01079 2G

FOREST MANAGEMENT

Nutrient Export in Stormflow Following Forest Harvesting and Site-Preparation in East Texas.
W91-01009 5B

Humus Form Development and Hillslope Runoff, and the Effect of Fire and Management, Under Mediterranean Forest in NE-Spain.
W91-01079 2G

FOREST SOILS

Nitrification in Sludge-Amended Michigan Forest Soils.
W91-01029 5E

Humus Form Development and Hillslope Runoff, and the Effect of Fire and Management, Under Mediterranean Forest in NE-Spain.
W91-01079 2G

FOREST WATERSHEDS

Assessment of Cumulative Impacts to Water Quality in a Forested Wetland Landscape.
W91-01017 4C

Effects of Clearfelling a Sitka Spruce Stand on the Water Balance of a Peaty Gley Soil at Kershope Forest, Cumbria.
W91-01069 4C

Comments on the Hydrochemical Regulation of the Halogen Elements in Rainfall, Stemflow, Throughfall and Stream Waters at an Acidic Forested Area in Mid-Wales.
W91-01447 5B

Changes in Stream Morphology and Storm Transport of Seston Following Watershed Disturbance.
W91-01505 2J

Problems in Determining the Return of a Watershed to Pretreatment Conditions: Techniques Applied to a Study at Caspar Creek, California.
W91-01523 4C

Role of Ammonium and Nitrate Retention in the Acidification of Lakes and Forested Catchments.
W91-01718 5B

FORMWORK

Investigation of Concrete in Absorbing Formwork.
W91-01653 8F

FOULING

Biofilm Characteristics in Coastal Waters of Bombay.
W91-01170 2L

Biofilms: Detection, Implications and Solutions.
W91-01239 5F

FOUNDATION FAILURE

Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.
W91-01651 8D

FOUNDATION ROCKS

Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.

FOURIER ANALYSIS

Fourier Domain Shape Analysis Methods: A Brief Review and an Illustrative Application to Rainfall Area Evolution.
W91-01537 2B

FRACTURE PERMEABILITY

Two-Phase Relative Permeability and Capillary Pressure of Rough-Walled Rock Fractures.
W91-01511 2F

FRAGILARIA

Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

FRANCE

Mathematical Model of Bacterial Contamination of the Morlaix Estuary (France).
W91-01419 5B

Study of Aquatic Community Dynamics in a Karstic System by the Use of Artificial Substrates.
W91-01766 2H

FREQUENCY ANALYSIS

Frequency Analysis of Trace Level Water Quality Data with a Time Varying Censoring Level.
W91-01198 5B

Practical Aspects of Low-Flow Frequency Analysis.
W91-01529 2E

FRESHWATER

Mercury Speciation in Surface Freshwater Systems in California and Other Areas.
W91-01063 2K

FROST

Chemistry of Dews and Frosts in Indianapolis, Indiana.
W91-01288 5B

FROUDE NUMBER

Flow Stability and Friction Factor in Rough Channels.
W91-01494 8B

Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

FROZEN GROUND

Relationships Among Depth to Frozen Soil, Soil Wetness, and Vegetation Type and Biomass in Tundra Near Bethel, Alaska, U.S.A.
W91-01369 5C

FUCUS

Fate and Effects of Pulp Mill Chlorophenolic 4,5,6-Trichloroguaiacol in a Model Brackish Water Ecosystem.
W91-01816 5B

FUGACITY

Predicting Bioaccumulation Potential: A Test of a Fugacity-Based Model.
W91-01316 5B

FUNGI

Metal Content of Fungal Sporocarps from Urban, Rural, and Sludge-Treated Sites.
W91-01005 5E

Relations Between Acid Rain and Vesicular Arbuscular Mycorrhiza.
W91-01410 5C

Microbiology of Foaming in Activated Sludge Plants.
W91-01654 5D

FUNGICIDES

Effect of Copper Sulfate on Hematology, Blood Chemistry, and Hepato-Somatic Index of an Indian Catfish, Heteropneustes fossilis (Bloch) and Its Recovery.
W91-01325 5C

Kinetic Study of the Decomposition of Methyl (1-(Butylcarbamoyl)-1H-benzimidazol-2-yl)carbamate (Benomyl) to Methyl 1H-Benzimidazol-2-ylcarbamate (MBC).
W91-01739 5

Pollution by the Fungicide Pentachloronitrobenzene in an Intensive Farming Area in Japan
W91-01815 5

Acute Toxicities and Hematological Effects of Two Substituted Naphthoquinones in Channel Catfish.
W91-01970 5

FURROW IRRIGATION

Adopting Water-Conserving Irrigation Technology: The Case of Surge Irrigation in Arizona
W91-01405 3

GAMMARUS

Effect of Short-Term Exposure to Pentachlorophenol and Osmotic Stress on the Free Amino Acid Pool of the Freshwater Amphipod Gammarus pseudolimnaeus Bousfield.
W91-01967 5

GAS CHROMATOGRAPHY

Simultaneous Dual Column, Dual-Detector Gas Chromatographic Determination of Chlorinated Pesticides and Polychlorinated Biphenyls in Environmental Samples.
W91-01281 5

GC-MS Identification of Gaseous Volatiles in Wastewater.
W91-01696 5

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

Gas Chromatography in Environmental Analysis: Aims and Challenges.
W91-01954 5A

GC-FTIRS: Applications in Organic Trace Analysis.
W91-01956 5A

Multiresidue Method by High Performance Liquid Chromatography-based Fractionation and Gas Chromatographic Determination of Trace Levels of Pesticides in Air and Water.
W91-02038 5A

GAS TRANSFER VELOCITY
Gas Transfer Velocities in Lakes Measured with SF6.
W91-01412 2H

GASES
Measuring Techniques for Gas/Solid Fluidized Bed Reactors (MeBtechniken fur Gas/Feststoff-Wirbelschichtreaktoren).
W91-01896 5D

GASTROPODS
Mollusc Thais haemastoma - An Exhibitor of 'Imposex' and Potential Biological Indicator of Tributyltin Pollution.
W91-01118 5C

Heavy Metal Concentration in Telescopium from Darwin Harbour, N.T., Australia.
W91-01164 5A

GENETIC ENGINEERING
Fate of Genetically Engineered Microorganisms in Freshwater.
W91-01240 5B

New Gene Sources for Development of Agronomic Plants with Tolerance to Drought and Other Abiotic Stresses.
W91-01859 3B

GENETIC POLLUTION
Fate of Genetically Engineered Microorganisms in Freshwater.
W91-01240 5B

GENOTOXICITY
Characterization of Genotoxic Components in Sediments by Mass Spectrometric Techniques Combined with Salmonella/Microsome Test.
W91-01686 5A

GEOCHEMISTRY
Biogeochemistry of Carbon in the Amazon River.
W91-01039 5B

Contribution of Organic Acids to Alkalinity in Lakes Within the Mount St. Helens Blast Zone.
W91-01051 2H

Mercury Speciation in Surface Freshwater Systems in California and Other Areas.
W91-01063 2K

Variability and Dynamics of Leaching of the Flysch Carpathian Slope.
W91-01078 2G

Multivariate Statistical Analyses of Sediment Geochemistry.
W91-01161 2L

Device for In Situ Determination of Geochemical Transport Parameters. 1. Retardation.
W91-01293 5B

Production and Carbon Isotopic Composition of Bacterial CO2 in Deep Coastal Plain Sediments of South Carolina.
W91-01297 2J

pH and Redox Buffering Mechanisms in a Glacial Drift Aquifer Contaminated by Landfill Leachate.
W91-01300 5B

Geochemical Modeling of the Madison Aquifer in Parts of Montana, Wyoming, and South Dakota.
W91-01517 2K

Solute Transport with Multisegment, Equilibrium-Controlled Reactions: A Feed Forward Simulation Method.
W91-01520 5B

Study on Geochemistry and Geochemical Classification of Elements B, F, Rb and Sr in Yellow Sea (Huang Hai) Sediments.
W91-01566 2J

Soda Lakes on Inner Mongolia Plateau, China.
W91-01574 2H

Spatial and Temporal Patterns in the Hydrogeochemistry of a Poor Fen in Northern Wisconsin.
W91-01720 2H

Elucidating Ground-Water Flow Paths in a Desert Terrane by Geochemical Methods.
W91-01784 2F

Specific Chemical Composition of Karst Groundwater in the Ophiolite Belt of the Yugoslav Inner Dinarides: A Case for Covered Karst.
W91-01885 2F

Heavy Metals in Sediments of the Yamuna River (A Tributary of the Ganges), India.
W91-02005 2K

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments I. The Limski Kanal (North Adriatic Sea).
W91-02009 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments II. The Krka River Estuary and the Kornati Islands (Central Adriatic Sea).
W91-02010 5B

GEODESY
Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

GEOGRAPHIC INFORMATION SYSTEMS
Automating Water Resource Management.
W91-01563 7B

GEOHYDROLOGIC DATA
Summary of Public Water-Supply Withdrawals and Geohydrologic Data for the Lower Connecticut River Valley from Windsor to Vernon, Vermont.
W91-01845 2F

GEOHYDROLOGY
Hydrogeology and Historical Assessment of a Classic Sequential-Land Use Landfill Site, Illinois, USA.
W91-01097 5F

Hydrogeologic Database for Ground-Water Modeling.
W91-01298 7C

Hydrogeological Decision Analysis: 1. A Framework.
W91-01301 6A

Logging of Special Hydrogeological Wells.
W91-01360 7B

Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 1. Review of Theory and Verification.
W91-01524 2F

Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 2. Application and Implications for Modeling Strategy.
W91-01525 2F

Spatial and Temporal Patterns in the Hydrogeochemistry of a Poor Fen in Northern Wisconsin.
W91-01720 2H

Source of Ground Water in the Deserts of Northern Chile: Evidence of Deep Circulation of Ground Water from the Andes.
W91-01779 2F

Geoelectrical Investigation for Ground Water in Crystalline Terrains of Central Bahia, Brazil.
W91-01780 2F

Causes of Soil Salinization: 2. A Basin in East-Central Alberta, Canada.
W91-01783 2G

Elucidating Ground-Water Flow Paths in a Desert Terrane by Geochemical Methods.
W91-01784 2F

Ground-Water Resources of the Arkansas River Basin in Arkansas.
W91-01835 2F

Hydrogeology of Aquifers in Cretaceous and Younger Rocks in the Vicinity of Onslow and Southern Jones Counties, North Carolina.
W91-01841 2F

Simulation of Ground-Water Flow in Aquifers in Cretaceous Rocks in the Central Coastal Plain, North Carolina.
W91-01843 2F

Summary of Public Water-Supply Withdrawals and Geohydrologic Data for the Lower Connecticut River Valley from Windsor to Vernon, Vermont.
W91-01845 2F

Geology and Ground-Water Resources of the Memphis Sand in Western Tennessee.
W91-01851 2F

Geohydrologic Characteristics and Simulated Response to Pumping Stresses in the Sparta Aquifer in East-Central Arkansas.
W91-01854 2F

Ground-Water Levels, Springs 1985, and Ground-Water Level Changes, Spring 1983 to Spring 1985, in Three Basalt Units Underlying the Columbia Plateau, Washington and Oregon.
W91-01868 7C

Specific Chemical Composition of Karst Groundwater in the Ophiolite Belt of the Yugoslav Inner Dinarides: A Case for Covered Karst.
W91-01885 2F

GEOLOGIC FRACTURES
Two-Phase Relative Permeability and Capillary Pressure of Rough-Walled Rock Fractures.
W91-01511 2F

LIBRARY U. OF I. GROUND WATER

GEOLOGIC FRACTURES

Geoelectrical Investigation for Ground Water in Crystalline Terrains of Central Bahia, Brazil.
W91-01780 2F

Ground-Surface Delineation of Fractures Over Mined-Out Openings Using Carbon Dioxide Emissions.
W91-01787 5G

GEOLOGIC UNITS

Ground-Water Levels, Springs 1985, and Ground-Water Level Changes, Spring 1983 to Spring 1985, in Three Basalt Units Underlying the Columbia Plateau, Washington and Oregon.
W91-01868 7C

GEOMORPHOLOGY

Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

Flow and Particle Paths at a Natural River Confluence with Coarse Bed Material.
W91-01071 2J

Spatial Scale Dependence of Sediment Dynamics in a Semi-Arid Badland Drainage Basin.
W91-01085 2J

Development of Bed Features.
W91-01491 2J

Theoretical Model of Optimal Drainage Networks.
W91-01526 2E

Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695 2J

Hillslope Erosion at the Maxey Flats Radioactive Waste Disposal Site, Northeastern Kentucky.
W91-01831 2J

Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

Solution-Collapse Depressions and Suspensates in the Limnocrenic Lake of Banyoles (Ne Spain).
W91-01876 2J

Channel Avulsion and River Metamorphosis: The Case of the Thomson River, Victoria, Australia.
W91-01879 2E

Influence of Debris Flows on Channels and Valley Floors in the Oregon Coast Range, U.S.A.
W91-01882 2J

GEOPHYSICAL EXPLORATION

Geoelectrical Investigation for Ground Water in Crystalline Terrains of Central Bahia, Brazil.
W91-01780 2F

GEOPHYSICAL METHODS

Use of Resistivity Soundings to Determine Landfill Structure.
W91-01786 5B

GEOPHYSICAL SURVEYS

Use of Resistivity Soundings to Determine Landfill Structure.
W91-01786 5B

GEORGIA

Dissolved and Suspended Solids Transport from Coastal Plain Watersheds.
W91-01011 5B

Aerobic and Anaerobic Degradation of Alachlor in Samples from a Surface-to Groundwater Profile.
W91-01019 5B

Modelling Black Fly Production Dynamics in Blackwater Streams.
W91-01346 2H

Cultural Eutrophication of West Point Lake--A 10-Year Study.
W91-01354 5C

GEOTECHNOLOGY

Hydrogeological Decision Analysis: 1. A Framework.
W91-01301 6A

GEOTEXTILES

Geotextiles as Sealing Liners for Earthen Manure Reservoirs: Part 1, Geotextile Porosity.
W91-01700 5G

Geotextiles as Sealing Liners for Earthen Manure Reservoirs: Part 2, Sealing Mechanisms.
W91-01701 5G

GERMAN BIGHT

Concentrations of Organochlorine Compounds in the Hermit Crab Pagurus bernhardus from the German Bight, December 1988 - May 1989.
W91-01941 5B

GERMANY

Effects and Behaviour of Pollutants During Artificial Groundwater Recharge.
W91-01251 5B

Phosphate (32P)-uptake Capabilities of Natural Picoplankton and Ultraplankton Communities in Lakes of Differing Degrees of Eutrophication.
W91-01336 5C

Stonefly Predation Along a Hydraulic Gradient: A Field Test of the Harsh--Benign Hypothesis.
W91-01347 2H

Studies on the Chemistry of Interstitial Water Taken from Defined Horizons in the Fine Sediments of Bivalve Habitats in Several Northern German Lowland Waters: I. Sampling Techniques.
W91-01768 2H

Substance Load in Rainwater Runoff from Different Streets in Hamburg.
W91-01993 5B

Design and Construction of Treatment Processes for Highway Runoff in the FRG.
W91-02001 5D

GIARDIA

Giardia in Wastewater: Effect of Treatment.
W91-01173 5D

GIARDIASIS

Giardia in Wastewater: Effect of Treatment.
W91-01173 5D

GILA RIVER

Perspective on El Nino and La Nina: Global Implications for Stream Ecology.
W91-01811 2B

GLACIAL AQUIFERS

pH and Redox Buffering Mechanisms in a Glacial Drift Aquifer Contaminated by Landfill Leachate.
W91-01300 5B

GLACIATION

Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

GLACIERS

Modified Koeppen Classification Applied to Model Simulations of Glacial and Interglacial Climates.
W91-01091 2B

GLOBAL WARMING

Modified Koeppen Classification Applied to Model Simulations of Glacial and Interglacial Climates.
W91-01091 2B

Relationships Among Depth to Frozen Soil, Soil Wetness, and Vegetation Type and Biomass in Tundra Near Bethel, Alaska, U.S.A.
W91-01369 5C

Global Climate Change: Implications for Air Temperature and Water Supply in Canada.
W91-01388 2B

Potential Changes in Thermal Structure and Cycle of Lake Michigan Due to Global Warming.
W91-01389 2H

Thermal Structure of the Lower Great Lakes in a Warm Year: Implications for the Occurrence of Hypolimnion Anoxia.
W91-01390 2H

Effects of Climate Warming on Dissolved Oxygen Concentrations in Lake Erie.
W91-01391 2H

Potential Application of Models in Forecasting the Effects of Climate Changes on Fisheries
W91-01392 2E

Temperature-Oxygen Habitat for Freshwater and Coastal Striped Bass in a Changing Climate
W91-01393 2E

Potential Changes in the Thermal Habitat o Great Lakes Fish after Global Climate Warming.
W91-01394 2I

Potential Effects of Global Climate Warming o the Growth and Prey Consumption of Grea Lakes Fish.
W91-01395 2I

Effect of Air Temperature on Growth of Largemouth Bass in North America.
W91-01396 2H

Potential Loss of Thermal Habitat for Brook Trout, Due to Climatic Warming, in Two Southern Ontario Streams.
W91-01397 8

Sea Lamprey as an Early Responder to Climat Change in the Great Lakes Basin.
W91-01398 2J

Size-Dependent Winter Mortality of Young-o the-Year White Perch: Climate Warming an Invasion of the Laurentian Great Lakes.
W91-01399 8

Climate Change and Fish Communities: A Co ceptual Framework.
W91-01401 8

Implications of Climate Change for Fisheri Management Policy.

GLYPHOSATE
Rapid Dissipation of Glyphosate in Small Forest Ponds.
W91-02018 5B

GOVERNMENTAL INTERRELATIONS
Comparative Analysis of State Environmental Policy.
W91-01630 6G

GRAIN CROPS
Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: II. Production and Income.
W91-01504 5E

GRANULAR ACTIVATED CARBON
Influence of Ozonated Natural Organic Matter on the Biodegradation of a Micropollutant in a GAC Bed.
W91-01753 5F

GRASSES
Relations Between Acid Rain and Vesicular-Arbuscular Mycorrhiza.
W91-01410 5C

Effect of Soil Water, Nitrogen, and Growing Degree-Days on Morphological Development of Crested and Western Wheat-Grass.
W91-01707 2I

GRAVEL
Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

Numerical Simulation of Gravel River Widening.
W91-01516 2J

Development of Armour in the Tambo River, Victoria, Australia.
W91-01880 2J

GRAVITY DAMS
Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

GRAZING
Seasonal Patterns of Grazing and Nutrient Limitation of Phytoplankton in a Eutrophic Lake.
W91-01144 2H

Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Rates of Protozoan Bacterivory in Three Habitats of a Southeastern Blackwater River.
W91-01809 2H

GREAT DISMAL SWAMP
Decomposition of Roots in a Seasonally Flooded Swamp Ecosystem.
W91-01331 2H

GREAT LAKES
Thermal Structure of the Lower Great Lakes in a Warm Year: Implications for the Occurrence of Hypolimnion Anoxia.
W91-01390 2H

Potential Changes in the Thermal Habitat of Great Lakes Fish after Global Climate Warming.
W91-01394 2B

Potential Effects of Global Climate Warming on the Growth and Prey Consumption of Great Lakes Fish.
W91-01395 2B

Size-Dependent Winter Mortality of Young-of-the-Year White Perch: Climate Warming and Invasion of the Laurentian Great Lakes.
W91-01399 8I

Geographical Distribution of Contaminants and Productivity Measures of Herring Gulls in the Great Lakes: Lake Erie and Connecting Channels 1978/79.
W91-01454 5B

Evaluation of the Potential for Toxics Exposure in the Great Lakes Region Using Storet Data.
W91-01732 5B

Estimating the Variation of Buoy Wind and Wave Data Biases.
W91-01797 2H

GREAT LAKES BASIN
Sea Lamprey as an Early Responder to Climate Change in the Great Lakes Basin.
W91-01398 2B

GREAT SALT LAKE
Record-Breaking Rise of Great Salt Lake in 1981-1986 Related to Anomalous Mid-Tropaspheric Wind Patterns.
W91-01580 2H

GREECE
Water Quality Evaluation in Lakes of Greece.
W91-01212 2H

Determination of Trace Quantities of Organotin Compounds in Coastal Waters of Greece by Graphite Furnace Atomic Absorption Spectrometry.

HYDRAULICS
Genesis of Free Hydraulic Jumps for Better Mixing.
W91-01421 5

Local Energy Losses in Two-Component Pressure FLows.
W91-01648 8

HYDROCARBONS
Use of the Mussel Watch and Molecular Marker Concepts in Studies of Hydrocarbons in a Tropical Bay (Todos os Santos, Bahia, Brazil).
W91-01690 5

Liquid Chromatographic Method with Fluorescence Detection for the Determination of Polycyclic Aromatic Hydrocarbons in Environmental Samples.
W91-01714

Utilization of Hydrocarbon Substrates by Hea Oil-degrading Bacteria Isolated from the S Water of Oil-Polluted Bisan Seto.
W91-01945

Distribution of Hydrocarbon Concentratio from Urban Runoff.
W91-01998

Application of Multivariate Analysis for Char terization of Organic Compounds from Urb Runoff.
W91-02004

Macroinvertebrate and Periphyton Response to Streambed Agitation for Release of Substrate-Trapped Hydrocarbons.
W91-02019 5C

Geographic Variation of Chlorinated Hydrocarbons in Burbot (Lota lota) from Remote Lakes and Rivers in Canada.
W91-02033 5B

HYDROCHLORIC ACID
Rainwater Acidity at Jabiru, Australia, in the Wet Season of 1983/84.
W91-01818 5B

HYDRODYNAMICS
Hydrodynamic Model for Wind-Driven and Tidal Circulation in the Arabian Gulf.
W91-01077 2L

Hydrodynamic Pressure Analysis of Arch Dams with T-Complete Functions.
W91-01489 8B

Advection Simulation by Minimax-Characteristics Method.
W91-01496 8B

HYDROELECTRIC PLANTS
Design of Rock Slopes in Soviet Hydropower Construction Practice.
W91-01433 8A

Possibilities of Constructing Hydroelectric Stations: Pumped Storage Stations in Armenia.
W91-01439 8C

Mechanical Equipment of the Tikhovsk Hydro Development on the Kuban River.
W91-01540 8C

Monitoring the State of the Dam of the Sayano-Shushenskoe Hydroelectric Station.
W91-01541 8A

Initial Period of Operation of the Channel Dam of the Kureika Hydroelectric Station.
W91-01542 8A

Experience in Operating Ecologically Clean Turbines.
W91-01543 8C

Downstream of the Novosibirsk Hydroelectric Station on the Ob River.
W91-01544 4A

Current Problems and Practice of Engineering-Geological Surveys when Designing Large Reservoirs.
W91-01545 6G

Experience in Using Digital Voltmeters in the System Measuring the Pool Levels and Head at Hydroelectric Stations.
W91-01546 8G

Design of Cranes for Operating Gates.
W91-01548 8C

Concerning the Problem of Assigning the Compositions of Steel Fiber-reinforced Concretes.
W91-01549 8F

What Results when the Building Codes are not Observed.
W91-01550 8B

Optimization of Hydropower Plant Integration in Water Supply System.
W91-01556 8C

Hydroelectric Dams and the Decline of Chinook Salmon in the Columbia River Basin.
W91-01560 6G

Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

Accommodating Fish and Wildlife Interests under the FPA.
W91-01628 6E

California v. FERC: State Regulation of Federal Hydropower.
W91-01629 6E

Mechanical Equipment of the Tashlyk Pumped-Storage Hydroelectric Station and Aleksandrovka Hydro Development of the Southern Ukraine Power Complex.
W91-01644 8C

Mechanical Equipment of the Vilyui No. 3 Hydroelectric Station.
W91-01645 8C

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.
W91-01651 8D

HYDROELECTRIC POWER
Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

HYDROGEN ION CONCENTRATION
pH and Redox Buffering Mechanisms in a Glacial Drift Aquifer Contaminated by Landfill Leachate.
W91-01300 5B

Effect of pH on the Accumulation Kinetics of Pentachlorophenol in Goldfish.
W91-01321 5B

Decomposition Rate, Chemical Composition and Nutrient Recycling of Nymphaea alba L. Floating Leaf Blade Detritus as Influenced by pH, Alkalinity and Aluminium in Laboratory Experiments.
W91-01332 2H

Micro-Arthropod Seasonality in Streams of Varying pH.
W91-01339 2H

Occurrence of Limnic Micro-Crustaceans in Relation to pH and Humic Content in Swedish Water Bodies.
W91-01350 2H

Metabolic Response of Grass Shrimp Palaemonetes kadiakensis Rathbun, to Acute Exposure of Sublethal Changes in pH.
W91-01366 5C

Chemical Composition and Acidity of Rainfall in the Alligator Rivers Region, Northern Territory, Australia.
W91-01449 5B

Utility of Scaled Chrysophytes for Inferring Lakewater pH in Northern New England Lakes.
W91-01502 2H

Effects of Ozone on the Infectivity of Hepatitis A Virus.
W91-01771 5F

Influence of pH on the Accumulation of Tri-N-Butyltin Chloride and Triphenyltin Chloride in Carp.
W91-01774 5B

Indicators of Chemical Pollution from Septic Systems.
W91-01785 5A

Effects of Low pH on the Chorion of Rainbow Trout, Oncorhynchus mykiss, and Brown Trout, Salmo trutta f. fario.
W91-01959 5C

Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

HYDROGEN PEROXIDE
Removal of Atrazine by Ozone and Ozone-Hydrogen Peroxide Combinations in Surface Water.
W91-01168 5F

Oxidation of Phenols in Water by Hydrogen Peroxide on Alumine Supported Iron (Oxydation des Phenols par le Peroxyde D'Hydrogene en Milieu Aqueux en Presence de fer Supporte sur Alumine).
W91-01418 2K

HYDROGEN SULFIDE
Mechanism for the Hydrogen Sulfide-Induced Growth Limitation in Wetland Macrophytes.
W91-01042 2H

Field Performance of Activated Carbon Adsorption for Sewage Air.
W91-01155 5D

HYDROGEOLOGY
Assessment of Hydrologic and Hydrogeologic Data at Camp Lejeune Marine Corps Base, North Carolina.
W91-01840 2F

HYDROGRAPHY
Hydrographic Surveys and Sedimentation in Deep Bay, Hong Kong.
W91-01883 2J

HYDROLOGIC APPLICATION
U.S. Geological Survey National Computer Technology Meeting: Program and Abstracts, May 7-11, 1990.
W91-01848 7C

HYDROLOGIC BUDGET
Effects of Clearfelling a Sitka Spruce Stand on the Water Balance of a Peaty Gley Soil at Kershope Forest, Cumbria.
W91-01069 4C

Monitoring of Rainfall in Relation to the Control of Migrant Pests.
W91-01561 2B

Climatic Control of Vegetation Distribution: The Role of the Water Balance.
W91-01684 2B

HYDROLOGIC DATA
Water Resources Data for New Mexico, Water Year 1989.
W91-01828 7C

Water Resources Data for Nebraska, Water Year 1989.
W91-01829 7C

Water Resources Data for Oregon, Water Year 1989, Volume 1. Eastern Oregon.
W91-01830 7C

Water-Resources Data-Network Evaluation for Monterey County, California, Phase 3: Northern Salinas River Drainage Basin.
W91-01836 7A

LIBRARY U. OF I. URBANA-CHAMPAIGN

Ground-Water Flow in the Gulf Coast Aquifer Systems, South-Central United States--A Preliminary Analysis.
W91-01838 2F

Sediment Transport and Accretion and the Hydrologic Environment of Grove Creek Near Kenansville, North Carolina.
W91-01839 2J

Assessment of Hydrologic and Hydrogeologic Data at Camp Lejeune Marine Corps Base, North Carolina.
W91-01840 2F

Hydrogeology of Aquifers in Cretaceous and Younger Rocks in the Vicinity of Onslow and Southern Jones Counties, North Carolina.
W91-01841 2F

Water Resources of Codington and Grant Counties, South Dakota.
W91-01842 2F

Hydrogeologic, Water-Level, and Water-Quality Data from Monitoring Wells at the U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-01844 5B

Primer on Clothing Systems for Cold-Weather Field Work.
W91-01846 7B

Ground-Water Levels, Flow, and Specific Conductance in Unconsolidated Aquifers Near Lake Erie, Cleveland to Conneaut, Ohio, September 1984.
W91-01855 2F

Water Resources Data for Iowa, Water Year 1989.
W91-01856 7C

Water Resources Data for West Virginia, Water Year 1988.
W91-01858 7C

Water Resources Data for Michigan, Water Year 1989.
W91-01864 7C

HYDROLOGIC DATA COLLECTIONS

Hydrological Information Transfer Using HOMS.
W91-01274 7C

Hydrogeologic Database for Ground-Water Modeling.
W91-01298 7C

HYDROLOGIC MODELS

Hydrodynamic Model for Wind-Driven and Tidal Circulation in the Arabian Gulf.
W91-01077 2L

Application of a Simple Lumped River Flow Forecasting Model to Hillslope Soil Water Storage Estimation.
W91-01086 2G

Rainfall Induced Soil Seal (C) A Dynamic Model with Kinetic Energy Instead of Cumulative Rainfall as Independent Variable.
W91-01089 2G

Urban Runoff Modeling for Administrative Purposes.
W91-01193 4C

Stochastic Models of Streamflow: Some Case Studies.
W91-01461 2E

Spatial Variability of Annual Precipitation and ENSO Events in Western Peru.
W91-01463 2B

Meta-Analytic Reappraisal of Statistical Results in the Environmental Sciences: The Case of a Hydrological Effect of Cloud Seeding.
W91-01470 3B

Further Exploratory Evaluations of Grossversuch IV Using Hailpad Data: Analysis of Hail Patterns and Stratification by Storm Type for Seeding Effect.
W91-01471 2B

Simulation Model of Water Depth in Mangrove Basin Forests.
W91-01989 2L

HYDROLOGIC REGIME

Downstream of the Novosibirsk Hydroelectric Station on the Ob River.
W91-01544 4A

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

HYDROLOGICAL REGIME

Relationships Between Wetland Fragmentation and Recent Hydrologic Changes in a Deltaic Coast.
W91-01903 2L

HYDROLOGICAL SIMULATION PROGRAM-FORTRAN

Application of the HSPF Model to Water Management in Africa.
W91-01199 6B

HYDROLYSIS

Hydrolysis of Chlorostilbene Oxide: II. Modeling of Hydrolysis in Aquifer Samples and in Sediment-Water Systems.
W91-01256 5B

Surface Ionization of Polynuclear Species in Al(III) Hydrolysis--I. Titration Results.
W91-01413 5F

Surface Ionization of Polynuclear Species in Al(III) Hydrolysis--II. A Conditional Equilibrium Model.
W91-01414 5F

Rate of Degradation of 1,1,1-Trichloroethane in Water by Hydrolysis and Dehydrochlorination.
W91-01729 5B

HYDROPHYTES

Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

HYDROPONICS

Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

HYETOGRAPHS

Hyetograph Compositing Effects on Urban Runoff Modelling.
W91-01206 7C

HYPOLIMNION

Thermal Structure of the Lower Great Lakes in a Warm Year: Implications for the Occurrence of Hypolimnion Anoxia.
W91-01390 2H

HYPOTHERMIA

Primer on Clothing Systems for Cold-Weather Field Work.
W91-01846 7B

ICE

Relevance of the Microphysical and Radiative Properties of Cirrus Clouds to Climate and Climatic Feedback.
W91-01445 2B

ICE FORMATION

Precipitation and Environmental Conditions during Accretion in Canadian East Coast Winter Storms.
W91-01487 2B

ICED LAKES

Anomalous Temperature and Oxygen Gradients Under the Ice of a High-Plains Lake in Wyoming.
W91-01148 2H

IDAHO

Macroinvertebrate and Periphyton Response to Streambed Agitation for Release of Substrate-Trapped Hydrocarbons.
W91-02019 5C

ILLINOIS

Assessment of Management Practices for Reducing Pesticide Runoff from Sloping Cropland in Illinois.
W91-01021 5G

Hydrogeology and Historical Assessment of a Classic Sequential-Land Use Landfill Site, Illinois, USA.
W91-01097 5F

IMMISCIBILITY

Infiltration of Immiscible Contaminants in the Unsaturated Zone.
W91-01296 5B

IMMOBILIZED BED REACTORS

Biodegradation of Chlorinated Hydrocarbons in an Immobilized Bed Reactor.
W91-01948 5D

IMMUNOASSAY

Photographic Screening Procedure for Triazine Herbicides in Water Using an Enhanced Luminescent Immunoassay.
W91-01230 5A

Failure of a Diagnostic Monoclonal Immunofluorescent Reagent to Detect Legionella pneumophila in Environmental Samples.
W91-01764 5A

Polyclonal and Monoclonal Enzyme Immunoassays for Picloram Detection in Water, Soil, Plants, and Urine.
W91-01912 5A

IMPOSEX

Mollusc Thais haemastoma - An Exhibitor of 'Imposex' and Potential Biological Indicator of Tributyltin Pollution.
W91-01118 5C

IN SITU TESTS

Device for In Situ Determination of Geochemical Transport Parameters. 1. Retardation.
W91-01293 5B

IN SITU TREATMENT

Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part I, Methodology and Field Site Characterization.
W91-01789 5G

Performance of Selected In Situ Soil Decontamination Technologies: An Air Force Perspective.
W91-01949 5G

Design Considerations for Soil Cleanup by Soil Vapor Extraction.
W91-01952 5G

In Situ Biodegradation of TCE Contaminated Groundwater.
W91-01953 5G

INCINERATION
Polycyclic Aromatic Hydrocarbon Emissions from the Combustion of Crude Oil on Water.
W91-01066 5B

Autothermal Fluid Bed for Sludge Incineration.
W91-01244 5E

INDIA
Heavy Metal Distribution in Sediments of Krishna River Basin, India.
W91-01100 5B

Differential Response of Wheat and Barley Genotypes to Substrate-Induced Salinity Under North Indian Conditions.
W91-01113 3C

Effect of Scheduling Irrigation and Phosphorus Levels on Yield of Pigeonpea in Gang Command Area.
W91-01116 3F

Mercury near a Caustic Soda Plant at Karwar, India.
W91-01163 5B

Stochastic Models of Streamflow: Some Case Studies.
W91-01461 2E

Real-time Multipurpose Reservoir Operation: A Case Study.
W91-01464 4A

Nitrates in Ground Water.
W91-01681 5B

Heavy Metals in Sediments of the Yamuna River (A Tributary of the Ganges), India.
W91-02005 2K

INDIAN RESERVATIONS
In Re Rights to Use Water in the Big Horn River 753P.2d76 (Wyo. 1988).
W91-01633 6E

INDIANAPOLIS
Chemistry of Dews and Frosts in Indianapolis, Indiana.
W91-01288 5B

INDUSTRIAL WASTES
Nonpriority Analysis of the Wastewater Streams of Four Dye Manufacturing Facilities.
W91-01172 5A

Toxicity of Water Extracts of Hazardous Waste.
W91-01231 5C

Anaerobic Digestion of Industrial and Agricultural Wastes.
W91-01245 5D

Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

Reduction of Toxic Chromate in an Industrial Effluent by Use of a Chromate-Reducing Strain of Enterobacter Cloacae.
W91-01641 5D

Observations on Overwintering Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) Exposed to Bleached Kraft Mill Effluent in the Upper Fraser River, British Columbia.
W91-01724 5B

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Innovative Management of an Aerated/Facultative Lagoon Suspended-Growth Biological Treatment System for High Strength Industrial Waste Stabilization.
W91-01950 5D

Phthalate Esters in Rivers of the Greater Manchester Area, U. K.
W91-02011 5B

INDUSTRIAL WASTEWATER
Influence of Immobilization Supports on Kinetic Constants of Anaerobic Purification of Olive Mill Wastewater.
W91-01055 5D

Start-Up in Anaerobic Treatment of Natural-Rubber Effluent.
W91-01056 5D

Industrial Effluents: Minimizing Environmental Impact.
W91-01246 5D

Industrial Pretreatment: Cooperation--To a Point...
W91-01565 5D

Minimization of Chromium-Contaminated Wastewater at a Plating Facility in the Eastern United States.
W91-01947 5D

Applications of Advanced Membrane Filtration to Industrial Wastewater Treatment and Groundwater Clean-up.
W91-01965 5D

Reclaiming Reverse Osmosis Blowdown with Electrodialysis Reversal.
W91-01984 5D

Effect of Pulp and Paper Mill Effluent Irrigation on Carbon Dioxide Evolution in Soils.
W91-01987 5E

Slurry-Explosive Plant Waste Waters: Environmental Impact and Treatment.
W91-02008 5C

INFECTION
Effects of Ozone on the Infectivity of Hepatitis A Virus.
W91-01771 5F

INFILTRATION
Infiltration of Immiscible Contaminants in the Unsaturated Zone.
W91-01296 5B

Deep-Well in the North-Holland Dune Area.
W91-01304 4B

Dual Water Flow Pattern in the Unsaturated Zone under a Gypsum-amended Soil.
W91-01475 2G

Inverse Solution for One-Dimensional Infiltration, and the Ratio A/K1.
W91-01519 2G

Surface Cover Effects on Soil Infiltration.
W91-01863 2G

Rainfall Induced Soil Seal: (A) A Critical Review of Observations and Models.
W91-01872 2G

Rainfall Induced Soil Seal: (B) Application of a New Model to Saturated Soils.
W91-01873 2G

Travel Times of Seepage Water Through Multilayered Covering Systems for Hazardous Waste Sites.
W91-01886 5B

INFILTRATION MODELS
Evaluate a Soil Loss Prediction Model Combined with an Infiltration Model for Tilled Soils.
W91-01861 2G

INFILTRATION RATE
Rainfall Induced Soil Seal: (A) A Critical Review of Observations and Models.
W91-01872 2G

Rainfall Induced Soil Seal: (B) Application of a New Model to Saturated Soils.
W91-01873 2G

INFILTROMETERS
Surface Cover Effects on Soil Infiltration.
W91-01863 2G

INFORMATION SYSTEMS
Hydrological Information Transfer Using HOMS.
W91-01274 7C

U.S. Geological Survey National Computer Technology Meeting: Program and Abstracts, May 7-11, 1990.
W91-01848 7C

INFORMATION TRANSFER
Hydrological Information Transfer Using HOMS.
W91-01274 7C

Annual Program Report - 1989 (FY 1988), (Massachusetts Water Resources Research Center).
W91-01860 9D

INHIBITION
Effects of Ammonia on Anaerobic Digestion of Simple Organic Substrates.
W91-01157 5D

Effect of Selected RCRA Compounds on Activated Sludge Activity.
W91-01171 5D

INJECTION WELLS
Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 1. Experimental Investigation.
W91-01531 2F

Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 2. Permeability.
W91-01532 2F

Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 3. Dispersivity and Model Verification.
W91-01533 2F

Substrate and Biomass Transport in a Porous Medium.
W91-01534 2F

Disposal of Concentrate from Brackish Water Desalting Plants by Use of Deep Injection Wells.
W91-01980 5E

INSECT CONTROL
Monitoring of Rainfall in Relation to the Control of Migrant Pests.
W91-01561 2B

Mosquito Control in Wastewater: A Controlled and Quantitative Comparison of Pupfish (Cyprinodon nevadensis amargosae), Mosquitofish (Gambusia affinis) and Guppies (Poecilia reticulata) in Sago Pondweed Marshes.
W91-01988 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

INSECTICIDES
Acute Toxicities of Five Synthetic Pyrethroid Insecticides to Daphnia magna and Ceriodaphnia dubia.
W91-01263 5C

INSTRUMENTATION
Application of a Hollow-Fiber, Tangential-Flow Device for Sampling Suspended Bacteria and Particles from Natural Waters.
W91-01031 5A

Evaluation of Biologically Harmful Ultraviolet Radiation in Antarctica with a Biological Dosimeter Designed for Aquatic Environments.
W91-01138 7B

Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Estimating the Variation of Buoy Wind and Wave Data Biases.
W91-01797 2H

INTERMITTENT STREAMS
Ecology of Two Intermittent Streams in Victoria, Australia. I. Multivariate Analyses of Physicochemical Features.
W91-01344 2E

Comparison of Detritus Processing Between Permanent and Intermittent Headwater Streams.
W91-01744 2H

INTERNATIONAL AGREEMENTS
Risk Perception in International River Basin Management: The Plata Basin Example.
W91-01119 6E

Supporting World Hydrology: Activities of International Hydrological Programs.
W91-01457 6E

INTERNATIONAL COMMISSIONS
Hydrological Information Transfer Using HOMS.
W91-01274 7C

INTERNATIONAL HYDROLOGICAL DECADE
Supporting World Hydrology: Activities of International Hydrological Programs.
W91-01457 6E

INTERNATIONAL LAW
Stemming the Tide of Marine Debris Pollution: Putting Domestic and International Control Authorities to Work.
W91-01093 5G

Queensland Rainforest and Wetlands Conflict: Australia's External Affairs Power--Domestic Control and International Conservation.
W91-01104 6E

Risk Perception in International River Basin Management: The Plata Basin Example.
W91-01119 6E

INTERNATIONAL WATERS
Risk Perception in International River Basin Management: The Plata Basin Example.
W91-01119 6E

INTERSTITIAL WATER
Simple Pore-Water Sampler for Coarse, Sandy Sediments of Low Porosity.
W91-01147 7B

Studies on the Chemistry of Interstitial Water Taken from Defined Horizons in the Fine Sediments of Bivalve Habitats in Several Northern German Lowland Waters: I. Sampling Techniques.
W91-01768 2H

Relationship Between Chlorinated Hydrocarbons and Organic Carbon in Sediment and Porewater.
W91-01795 5B

Interstitial Dissolved Organic Carbon in Sediments of a Southern Appalachian Headwater Stream.
W91-01804 2H

INTRODUCED SPECIES
Size-Dependent Winter Mortality of Young-of-the-Year White Perch: Climate Warming and Invasion of the Laurentian Great Lakes.
W91-01399 8I

INVERTEBRATES
Invertebrate Communities of Small Streams in Northeastern Wyoming.
W91-01850 2H

Acid Precipitation: Biological Monitoring of Streams and Lakes.
W91-01890 5A

Discharge-Export Relationships in Headwater Streams: The Influence of Invertebrate Manipulations and Drought.
W91-01925 2H

Toxicity of Five Shale Oils to Fish and Aquatic Invertebrates.
W91-01971 5C

Drilling Fluids and the Arctic Tundra of Alaska: Assessing Contamination of Wetlands Habitat and the Toxicity to Aquatic Invertebrates and Fish.
W91-01975 5B

ION EXCHANGE
Soil and Soil Solution Chemical Composition at Three Sites within the Loch Dee Catchment, SW Scotland.
W91-01480 2K

ION-SELECTIVE ELECTRODES
Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

ION TRAP DETECTOR
Determination of Volatile Organics in Drinking Water with USEPA Method 524.2 and the Ion Trap Detector.
W91-01915 5F

IONIC INTERFERENCE
Copper Toxicity to Paratya australiensis: II. Influence of Bicarbonate and Ionic Strength.
W91-01259 5C

IONIZATION
Surface Ionization of Polynuclear Species in Al(III) Hydrolysis--I. Titration Results.
W91-01413 5F

IOWA
Heat Stress, Plant-Available Soil Moisture, and Corn Yields in Iowa: A Short- and Long-Term View.
W91-01703 3F

Water Resources Data for Iowa, Water Year 1989.
W91-01856 7C

IPRODIENE
Rapid Method for the Simultaneous Analysis of Chlorpyrifos, Isofenphos, Carbaryl, Iprodione, and Triadimefon in Groundwater by Solid-Phase Extraction.
W91-01917 5A

IRISH SEA
Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

IRON
Temporal Solubility Trends of Aluminum and Iron Leached from Coal Spoils and Contaminated Soil Materials.
W91-01007 5B

Abiotic Transformations of Iron and Phosphate in Humic Lake Water Revealed by Double-Isotope Labeling and Gel Filtration.
W91-01048 2H

Oxidation of Phenols in Water by Hydrogen Peroxide on Alumine Supported Iron (Oxydation des Phenols par le Peroxyde D'Hydrogene en Milieu Aqueux en Presence de fer Supporte sur Alumine).
W91-01418 2K

Inorganic Contaminants in Suspended Solids from Hamilton Harbour.
W91-01798 5B

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

IRON COMPOUNDS
Greigite and the Magnetic Properties of Sediments.
W91-01050 2H

IRRIGATION
Computerized Scheduling for Irrigation Management and Pumping Operations in the Watercourse Command.
W91-01404 3F

Adopting Water-Conserving Irrigation Technology: The Case of Surge Irrigation in Arizona.
W91-01405 3F

Estimation of Manning's Roughness Coefficient for Basin and Border Irrigation.
W91-01406 3F

Water and Fertilizer Interrelations with Irrigated Maize.
W91-01408 3F

Dynamics of Root and Shoot Growth of Barley Under Various Levels of Salinity and Water Stress.
W91-01409 3F

IRRIGATION EFFECTS
Differential Response of Wheat and Barley Genotypes to Substrate-Induced Salinity Under North Indian Conditions.
W91-01113 3C

Evapotranspiration, Water Use Efficiency, Moisture Extraction Pattern and Plant Water Relations of Rape (Brassica campestris) Genotypes in Relation to Root Development Under Varying Irrigation Schedules.
W91-01114 2D

Effects of Irrigation Methods on Growth, Yield and Consumptive Use of Water of Banana cv. Nendran Grown in Clay Loam Soils.
W91-01117 3F

IRRIGATION EFFICIENCY
Predicting Water Use and Water Application Efficiencies for Different Irrigation Depths in Wheat.
W91-01115 3F

Computerized Scheduling for Irrigation Management and Pumping Operations in the Watercourse Command.
W91-01404 3F

Adopting Water-Conserving Irrigation Technology: The Case of Surge Irrigation in Arizona.
W91-01405 3F

IRRIGATION PRACTICES
Effect of Scheduling Irrigation and Phosphorus Levels on Yield of Pigeonpea in Gang Command Area.
W91-01116 3F

Effects of Irrigation Methods on Growth, Yield and Consumptive Use of Water of Banana cv. Nendran Grown in Clay Loam Soils.
W91-01117 3F

Changes in West African Savanna Agriculture in Response to Growing Population and Continuing Low Rainfall.
W91-01683 6D

IRRIGATION PROGRAMS
Predicting Water Use and Water Application Efficiencies for Different Irrigation Depths in Wheat.
W91-01115 3F

IRRIGATION SCHEDULING
Computerized Scheduling for Irrigation Management and Pumping Operations in the Watercourse Command.
W91-01404 3F

Development of Methodology and Criteria for Irrigation Management Under Limited Water Conditions.
W91-01853 3F

IRRIGATION WATER
Irrigation with Membrane Plant Concentrate: Fort Myers Case Study.
W91-01981 3C

ISLANDS
Determination of Designated Floodway Boundaries Around Long Islands in Stream Channels.
W91-01209 2E

ISOFENPHOS
Rapid Method for the Simultaneous Analysis of Chlorpyrifos, Isofenphos, Carbaryl, Iprodione, and Triadimefon in Groundwater by Solid-Phase Extraction.
W91-01917 5A

JAMES RIVER
Comparison of Phytoplankton Assemblages and Environmental Relationships in Three Estuarine Rivers of the Lower Chesapeake Bay.
W91-01905 2L

JAPAN
Estimation of Ammonification and Ammonium Assimilation in Surficial Coastal and Estuarine Sediments.
W91-01035 2L

Acid Deposition in Central Japan.
W91-01283 5B

Trends of Air Quality and Atmospheric Deposition in Tokyo.
W91-01284 5B

Colonization Process of a Typical Epilithic Algal Community--Homoeothrix janthina-Achnanthes japonica Community--in a Less Polluted River in Japan (in Japanese).
W91-01383 2H

Fate of Macrozoobenthos in Hypertrophic Lakes: In Situ Rearing Experiments with the Larvae of Tokunagayusurika akamusi (Chironomidae).
W91-01769 5C

JUDICIAL DECISIONS
Bersani v. EPA: Toward a Plausible Interpretation of the 404(b)(1) Guidelines for Evaluating Permit Applications for Wetland Development.
W91-01092 5G

In Re Water of Hallett Creek System.
W91-01120 6E

United States v. Larkins: Conflict Between Wetland Protection and Agriculture; Exploration of the Farming Exemption to the Clean Water Act's Section 404 Permit Requirements.
W91-01123 6E

Is There a Reserved Water Right for Wildlife on the Wind River Indian Reservation: A Critical Analysis of the Big Horn River General Adjudication.
W91-01124 6E

Liability for Damages Arising from an Oil Spill.
W91-01627 5G

California v. FERC: State Regulation of Federal Hydropower.
W91-01629 6E

In Re Rights to Use Water in the Big Horn River 753P.2d76 (Wyo. 1988).
W91-01633 6E

Citizen Enforcement of Clean Water Act Violations; The Supreme Court Steers a New Course over Muddied Waters; Gwaltney of Smithfield, Ltd. v. Chesapeake Bay Foundation, Inc.
W91-01634 6E

JURISDICTION
Environmentalism, Policy Factors and the Courts in New Zealand.
W91-01622 6E

KARST
Study of Aquatic Community Dynamics in a Karstic System by the Use of Artificial Substrates.
W91-01766 2H

Solution-Collapse Depressions and Suspensates in the Limnocrenic Lake of Banyoles (Ne Spain).
W91-01876 2J

Specific Chemical Composition of Karst Groundwater in the Ophiolite Belt of the Yugoslav Inner Dinarides: A Case for Covered Karst.
W91-01885 2F

KARST HYDROLOGY
Study of Aquatic Community Dynamics in a Karstic System by the Use of Artificial Substrates.
W91-01766 2H

Specific Chemical Composition of Karst Groundwater in the Ophiolite Belt of the Yugoslav Inner Dinarides: A Case for Covered Karst.
W91-01885 2F

KARWAR
Mercury near a Caustic Soda Plant at Karwar, India.
W91-01163 5B

KENTUCKY
Influence of Water Chemistry on Suspended Solids in Coal Mine Sedimentation Ponds.
W91-01013 5D

Hillslope Erosion at the Maxey Flats Radioactive Waste Disposal Site, Northeastern Kentucky.
W91-01831 2J

KERSHOPE FOREST
Effects of Clearfelling a Sitka Spruce Stand on the Water Balance of a Peaty Gley Soil at Kershope Forest, Cumbria.
W91-01069 4C

KESTERSON RESERVOIR
Influence of Temperature and Organic Amendments on the Mobilization of Selenium in Sediments.
W91-01990 5B

Bioaccumulation of Selenium in Birds at Kesterson Reservoir, California.
W91-02029 5C

KIDNEYS
Aluminum in Domestic Water: Overload May Be Hazardous to Dialysis Patients.
W91-01382 5C

KIEL BIGHT
Atmospheric Input of Inorganic Nitrogen Species to the Kiel Bight.
W91-01921 5B

KILLIFISH
Comparison of the Diets of Gulf Killifish, Fundulus grandis Baird and Girard, Entering and Leaving a Mississippi Brackish Marsh.
W91-01909 2L

KINEMATIC WAVE THEORY
Kinematic Cascades: Derivation of a Generalized Shock Formation Criterion.
W91-01673 8B

KINETIC ENERGY
Rainfall Induced Soil Seal (C) A Dynamic Model with Kinetic Energy Instead of Cumulative Rainfall as Independent Variable.
W91-01089 2G

KINETICS
Influence of Immobilization Supports on Kinetic Constants of Anaerobic Purification of Olive Mill Wastewater.
W91-01055 5D

Kinetic Study of the Decomposition of Methyl (1-(Butylcarbamoyl)-1H-benzimidazol-2-yl)carbamate (Benomyl) to Methyl 1H-Benzimidazol-2-ylcarbamate (MBC).
W91-01739 5B

KRAFT MILL WASTES
Metabolic Effects of Kraft Mill Effluents on the Eel Anguilla anguilla L.
W91-01323 5C

KRISHNA RIVER
Heavy Metal Distribution in Sediments of Krishna River Basin, India.
W91-01100 5B

LA NINA
Perspective on El Nino and La Nina: Global Implications for Stream Ecology.
W91-01811 2B

LABORATORY EQUIPMENT
Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Effects of Herbivore Type and Density on Chemical Composition of Algal Assemblages in Laboratory Streams.
W91-01807 2H

LIBRARY U. OF I. ENGINEERING

LABORATORY METHODS
Assessment of the Ontario Ministry of the Environment Protocols for Conducting Daphnia magna Acute Lethal Toxicity Tests with Pulp and Paper Mill Effluents.
W91-01266 5C

Experimental Testing of Transient Unsaturated Flow Theory at Low Water Content in a Centrifugal Field.
W91-01514 2G

Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Effects of Herbivore Type and Density on Chemical Composition of Algal Assemblages in Laboratory Streams.
W91-01807 2H

Broad-Range Methods for Determination of Pollutants in Wastewater.
W91-01914 5A

Determination of Volatile Organics in Drinking Water with USEPA Method 524.2 and the Ion Trap Detector.
W91-01915 5F

Rapid Method for the Simultaneous Analysis of Chlorpyrifos, Isofenphos, Carbaryl, Iprodione, and Triadimefon in Groundwater by Solid-Phase Extraction.
W91-01917 5A

Reversed-Phase Liquid Chromatographic Column Switching for the Trace-Level Determination of Polar Compounds. Application to Chloroallyl Alcohol in Ground Water.
W91-01918 5A

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

LAGOONS
Time Trend of PCB Concentrations in Surface Sediments from a Hypertrophic, Macroalgae Populated Area of the Lagoon of Venice.
W91-01448 5B

Contribution of Benthic Biomass to Overall Metabolism in New Caledonia Lagoon Sediments.
W91-01659 2L

LAKE ACIDIFICATION
Effects of Lake Acidification on Aquatic Macrophytes--A Review.
W91-01105 5C

Comparison of the Acidification Efficiencies of Nitric and Sulfuric Acids by Two Whole-Lake Addition Experiments.
W91-01143 5B

PIRLA Project (Paleoecological Investigation of Recent Lake Acidification): An Introduction to the Synthesis of the Project.
W91-01498 5B

Paleoecological Investigation of Recent Lake Acidification in the Adirondack Mountains, N.Y.
W91-01499 5B

Utility of Scaled Chrysophytes for Inferring Lakewater pH in Northern New England Lakes.
W91-01502 2H

Thermal and Trophic Stability of Deeper Maine Lakes in Granite Watersheds Impacted by Acid Deposition.
W91-01530 5C

Ecological Mechanisms Important for the Biotic Changes in Acidified Lakes in Scandinavia.
W91-02015 5C

LAKE BASINS
PIRLA Project (Paleoecological Investigation of Recent Lake Acidification): An Introduction to the Synthesis of the Project.
W91-01498 5B

LAKE ECOLOGY
Refuge Availability: A Key to Understanding the Summer Disappearance of Daphnia.
W91-01342 2H

Associations of Aquatic Insects (Ephemeroptera, Plecoptera, and Trichoptera) in a Network of Subarctic Lakes and Streams in Quebec.
W91-01349 2H

LAKE ERIE
Effects of Climate Warming on Dissolved Oxygen Concentrations in Lake Erie.
W91-01391 2H

Geographical Distribution of Contaminants and Productivity Measures of Herring Gulls in the Great Lakes: Lake Erie and Connecting Channels 1978/79.
W91-01454 5B

Decreasing Chloride Trends Observed at Lake Erie Municipal Water Intakes.
W91-01793 5G

Estimation of Recruitment Forgone Resulting from Larval Fish Entrainment.
W91-01794 6G

LAKE EVAPORATION
Water Body Evaporation Experiment of Poyang lake (in Chinese).
W91-01576 2H

LAKE HURON
Planktonic Protozoa in Lakes Huron and Michigan: Seasonal Abundance and Composition of Ciliates and Dinoflagellates.
W91-01799 2H

LAKE LUCERNE
Epilimnetic Carbon Flux and Turnover of Different Particle Size Classes in Oligo-Mesotrophic Lake Lucerne, Switzerland.
W91-01335 5B

LAKE MANAGEMENT
Modeling Linked Watershed and Lake Processes for Water Quality Management Decisions.
W91-01012 5G

LAKE MENDOTA
Seasonal Patterns of Grazing and Nutrient Limitation of Phytoplankton in a Eutrophic Lake.
W91-01144 2H

LAKE MICHIGAN
Distribution of Labile Dissolved Organic Carbon in Lake Michigan.
W91-01044 2H

Potential Changes in Thermal Structure and Cycle of Lake Michigan Due to Global Warming.
W91-01389 2H

Planktonic Protozoa in Lakes Huron and Michigan: Seasonal Abundance and Composition of Ciliates and Dinoflagellates.
W91-01799 2H

LAKE MORPHOLOGY
Solution-Collapse Depressions and Suspensates in the Limnocrenic Lake of Banyoles (Ne Spain).
W91-01876 2J

LAKE NASSER
Revised Estimate of the Life Span for Lake Nasser.
W91-01884 2H

LAKE ONTARIO
Experimental Use of Dialysis Chamber Arrays to Study P-Fluxes in the Bay of Quinte, 1987.
W91-01796 2H

Inorganic Contaminants in Suspended Solids from Hamilton Harbour.
W91-01798 5B

LAKE RESTORATION
Importance of Natural Processes in Understanding Ecosystem Change: A Case Study of Limed Lakes.
W91-01073 2H

Is It Possible to Regain an Ecological Balance in a Lake With Blooms of Nuisance Microorganisms.
W91-01220 5C

Responses of Plankton and Nutrients to Methylene Blue-Photosensitized Lake Restoration.
W91-01736 5G

LAKE SEDIMENTS
Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

Algal Use of Sedimentary Phosphorus from an Amazon Floodplain Lake: Implications for Total Phosphorus Analysis in Turbid Waters.
W91-01047 2H

Variability of Diatom Concentrations and Accumulation Rates in Sediments of a Small Lake Basin.
W91-01049 2H

Greigite and the Magnetic Properties of Sediments.
W91-01050 2H

Seasonal Variations of Population Density and Activity of Sulfate-Reducing Bacteria in Offshore and Reed Sediments of a Hypertrophic Freshwater Lake.
W91-01072 2H

Sequentially Extracted Metals in Adirondack Lake Sediment Cores.
W91-01500 2H

Calculation and Uncertainty Analysis of Pb210 Dates for PIRLA Project Lake Sediment Cores.
W91-01501 2H

Studies on the Chemistry of Interstitial Water Taken from Defined Horizons in the Fine Sediments of Bivalve Habitats in Several Northern German Lowland Waters: I. Sampling Techniques.
W91-01768 2H

LAKE ST CLAIR
Modeling the Fate and Transport of Organic Contaminants in Lake St. Clair.
W91-01792 5B

LAKE SUPERIOR
Abundance of Spawning Pacific Salmon in Two Lake Superior Streams, 1981-1987.
W91-01791 8I

Relationship Between Chlorinated Hydrocarbons and Organic Carbon in Sediment and Porewater.
W91-01795 5E

LAKE TAHOE
Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

LAKE TAHOE BASIN
Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

LAKE TANGANYIKA
Biosedimentology and Paleohydrology of Holocene Stromatolites from Lake Tanganyika (Biosedimentologie des Stromatolites Holocenes du lac Tanganyika (Burundi). Implications Hydrologiques).
W91-01372 2J

LAKE TEGANUMA
Seasonal Variations of Population Density and Activity of Sulfate-Reducing Bacteria in Offshore and Reed Sediments of a Hypertrophic Freshwater Lake.
W91-01072 2H

LAKE TIBERIAS
Long Term Patterns in Nutrients, Phytoplankton and Zooplankton of Lake Kinneret and Future Predictions for Ecosystem Structure.
W91-01337 5C

LAKES
Abiotic Transformations of Iron and Phosphate in Humic Lake Water Revealed by Double-Isotope Labeling and Gel Filtration.
W91-01048 2H

Water Quality Evaluation in Lakes of Greece.
W91-01212 2H

Gas Transfer Velocities in Lakes Measured with SF6.
W91-01412 2H

Prediction of Phosphate Coprecipitation with Calcite in Freshwaters.
W91-01423 2H

Studies on the Physico-Chemical Properties of Water their Variation in the Erhai Lake (in Chinese).
W91-01568 2H

Water Body Evaporation Experiment of Poyang lake (in Chinese).
W91-01576 2H

Analysis of Air Temperature Effect of Taihu Lake (in Chinese).
W91-01577 2H

Effect of Extracellular Organic Carbon (EOC) from Phytoplankton on the Community Structure of Oligotrophic Bacteria.
W91-01590 2H

Input and Mineralization of Organic Carbon in Lakes.
W91-01601 2H

Numbers and Activity of Bacterioplankton in Various Types of Waters in Czechoslovakia: Relations to Chlorophyll Concentration.
W91-01610 2H

Bacterial Production and Respiration in the Lakes of Different Types.
W91-01611 2H

Note on the Measurement of Production of Phototrophic Bacteria in Deep Layers.
W91-01614 2H

Trophic Relation in the Microzooplankton Community.
W91-01615 2H

Comparison Between Measured Wave Properties and Simple Wave Hindcasting Models in Shallow Water.
W91-01671 8B

Role of Ammonium and Nitrate Retention in the Acidification of Lakes and Forested Catchments.
W91-01718 5B

Isolation and Characterization of Hepatotoxic Microcystin Homologs from the Filamentous Freshwater Cyanobacterium Nostoc sp. Strain 152.
W91-01761 2H

Selenium as a Nutrient for Freshwater Bacterioplankton and Its Interactions with Phosphorus.
W91-01802 2H

Revised Estimate of the Life Span for Lake Nasser.
W91-01884 2H

Acidification in Norway - Loss of Fish Populations and the 1000 Lake Survey 1986.
W91-01889 5C

Occurrence of Heavy Metals in Water, Phytoplankton, and Zooplankton of a Mesotrophic Lake in Eastern Poland.
W91-01891 5B

Accumulation of Heavy Metals in a Lake Ecosystem.
W91-01892 5B

Geographic Variation of Chlorinated Hydrocarbons in Burbot (Lota lota) from Remote Lakes and Rivers in Canada.
W91-02033 5B

LAMPREY
Sea Lamprey as an Early Responder to Climate Change in the Great Lakes Basin.
W91-01398 2B

LAND DEVELOPMENT
Environmental Impacts of Development on Wetlands in Arid and Semi-arid Lands.
W91-01462 6G

Permit Reform Through Coastal Consistency Preview: An Analysis of Alaska's Coordinated Process.
W91-01621 6F

LAND DISPOSAL
Some Physical Properties of Structural Aggregates Separated from Organic Waste-Amended Soils.
W91-01054 5E

Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

Irrigation with Membrane Plant Concentrate: Fort Myers Case Study.
W91-01981 3C

LAND LOSS
Development, Calibration and Field Testing of a Soil Loss and a Runoff Model Derived from a Small-Scale Physical Simulation of the Erosion Environment on Arable Land in Zimbabwe.
W91-01478 2J

LAND RECLAMATION
Unexpected Hydrologic Perturbation in an Abandoned Underground Coal Mine: Response to Surface Reclamation.
W91-01098 4C

Succession of the Plankton Community during Coastal Reclamation with the Solid Wastes.
W91-01943 5E

Change of Water Quality and Composition of Plankton in the Pond of Reclaimed Site.
W91-01944 5E

LAND SUBSIDENCE
Interbed Storage Changes and Compaction in Models of Regional Groundwater Flow.
W91-01513 2F

LAND USE
Assessment of Cumulative Impacts to Water Quality in a Forested Wetland Landscape.
W91-01017 4C

Forests and the Temperature of Upland Streams in Wales: A Modelling Exploration of the Biological Effects.
W91-01343 2E

Problems in Determining the Return of a Watershed to Pretreatment Conditions: Techniques Applied to a Study at Caspar Creek, California.
W91-01523 4C

Changes in West African Savanna Agriculture in Response to Growing Population and Continuing Low Rainfall.
W91-01683 6D

LANDFILL COVERS
Travel Times of Seepage Water Through Multilayered Covering Systems for Hazardous Waste Sites.
W91-01886 5B

LANDFILLS
Hydrogeology and Historical Assessment of a Classic Sequential-Land Use Landfill Site, Illinois, USA.
W91-01097 5F

pH and Redox Buffering Mechanisms in a Glacial Drift Aquifer Contaminated by Landfill Leachate.
W91-01300 5B

Use of Resistivity Soundings to Determine Landfill Structure.
W91-01786 5B

Succession of the Plankton Community during Coastal Reclamation with the Solid Wastes.
W91-01943 5E

LANDSLIDES
Predicting Wave Formation in Mountain Reservoirs During Landfalls and Landslides.
W91-01443 8B

LEACHATES
Release of Cationic Aluminium from Acidic Soils into Drainage Water and Relationships with Land Use.
W91-01479 5B

Effect of Environmental Storage Conditions on the Organic Content of Simulated Coal Leachates.
W91-01689 5G

Analysis of Target and Nontarget Pollutants in Aqueous Leachates from the Hazardous Waste Site in Stringfellow, California, Via Ion Chromatography-Particle Beam and Inductively Coupled Plasma Mass Spectrometry.
W91-01728 5A

Use of Resistivity Soundings to Determine Landfill Structure.
W91-01786 5B

LEACHING
Leaching of Radionuclides from Decaying Blueberry Leaves: Relative Rate Independent of Concentration.
W91-01018 5B

LIBRARY U. OF I. URBANA-CHAMPAIGN

LEACHING

Atrazine and Bromide Movement through a Silt Loam Soil.
W91-01022 5B

Variability and Dynamics of Leaching of the Flysch Carpathian Slope.
W91-01078 2G

Agriculture: A Positive Contribution to Water Quality.
W91-01249 5G

Calibration and Validation of a Model of Non-Interactive Solute Leaching in a Clay-Loam Arable Soil.
W91-01477 7C

Soil and Soil Solution Chemical Composition at Three Sites within the Loch Dee Catchment, SW Scotland.
W91-01480 2K

Influence of Temperature and Organic Amendments on the Mobilization of Selenium in Sediments.
W91-01990 5B

LEAD

Immobilization Mechanisms in Solidification/Stabilization of Cd and Pb Salts Using Portland Cement Fixing Agents.
W91-01182 5G

Contamination of Potable Water by Corrosion of Tin-Lead Soldered Joints.
W91-01222 5B

Causes of Temporal Variability of Lead in Domestic Plumbing Systems.
W91-01698 5B

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Trends in the Heavy Metal Levels in the Dissolved and Particulate Phase in the Dutch Rhine-Meuse (Maas) Delta.
W91-01817 5B

Mercury, Cadmium and Lead in Eels and Roach: The Effects of Size, Season, and Locality on Metal Concentrations in Flesh and Liver.
W91-01821 5B

Mercury, Cadmium and Lead Concentrations in Five Species of Freshwater Fish from Eastern England.
W91-01822 5B

Effects of Sample Preparation on Measured Concentrations of Eight Elements in Edible Tissues of Fish from Streams Contaminated by Lead Mining.
W91-01968 5A

Transport of Heavy Metals Within a Small Urban Catchment.
W91-01992 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments I. The Limski Kanal (North Adriatic Sea).
W91-02009 5B

Behavior of Heavy Metals During Wastewater Treatment, II. Lead, Nickel, and Zinc.
W91-02013 5D

Shell as a Site of Lead Deposition in Helix aspersa.
W91-02025 5B

LEAD RADIOISOTOPES

Calculation and Uncertainty Analysis of Pb210 Dates for PIRLA Project Lake Sediment Cores.
W91-01501 2H

LEAKAGE

Enforcement of Federal Underground Storage Tank Regulations.
W91-01103 5G

Leakage Control in a Universally Metered Distribution System: Pinetown Water's Experience.
W91-01270 3D

LEAKY AQUIFERS

Variational Sensitivity Analysis, Data Requirements, and Parameter Identification in a Leaky Aquifer System.
W91-01512 2C

LEAVES

Effect of Nutrient Content on Leaf Decomposition in a Coastal Plain Stream: A Comparison of Green and Senescent Leaves.
W91-01742 2H

Effects of Acidification on Leaf Decomposition in Streams.
W91-01803 5C

LEGAL ASPECTS

Bersani v. EPA: Toward a Plausible Interpretation of the 404(b)(1) Guidelines for Evaluating Permit Applications for Wetland Development.
W91-01092 5G

Environmentalism, Policy Factors and the Courts in New Zealand.
W91-01622 6E

Federal and State Roles in Environmental Enforcement: A Proposal for a More Effective and More Efficient Relationship.
W91-01624 5G

Liability for Damages Arising from an Oil Spill.
W91-01627 5G

W91-01633 6E

Proposed EPA Sludge Disposal Regulations: Project Purgatory.
W91-01676 5E

LEGIONELLA

Outbreak of Pontiac Fever Due to Legionella anisa.
W91-01032 5C

Association of Shower Use with Legionnaires' Disease.
W91-01186 5B

Inactivation of Legionella pneumophila by Potassium Permanganate.
W91-01640 5F

Inhibition of Growth of Legionella Species by Heterotrophic Plate Count Bacteria Isolated from Chlorinated Drinking Water.
W91-01665 5F

Failure of a Diagnostic Monoclonal Immunofluorescent Reagent to Detect Legionella pneumophila in Environmental Samples.
W91-01764 5A

LEGISLATION

Accommodating Fish and Wildlife Interests under the FPA.
W91-01628 6E

LEGUMES

Effect of Scheduling Irrigation and Phosphorus Levels on Yield of Pigeonpea in Gang Command Area.
W91-01116 3F

LEUCINE

Incorporation of Thymidine, Adenine and Leucine into Natural Bacterial Assemblages.
W91-01931 2L

LIABILITY

Developing an Economic Methodology for Legal Provisions Regulating Groundwater Pollution.
W91-01217 5G

Liability for Damages Arising from an Oil Spill.
W91-01627 5G

LICENSING

Accommodating Fish and Wildlife Interests under the FPA.
W91-01628 6E

LIGHT EFFECTS

Effect of Periodic Illumination on Nitrification in the Continuous Cultivation.
W91-01604 2H

LIGHT INTENSITY

Effects of Light, Temperature, Nitrate, Orthophosphate, and Bacteria on Growth of and Hepatotoxin Production by Oscillatoria agardhii Strains.
W91-01762 5B

Growth of Submerged Macrophytes Under Experimental Salinity and Light Conditions.
W91-01907 2H

LIME

Physico-Chemical Treatment of Wastewater: Experience and Future Development.
W91-01232 5D

Use of Lime-Stabilized Dairy-Plant Waste for Forage Production.
W91-01704 5E

LIMING

Importance of Natural Processes in Understanding Ecosystem Change: A Case Study of Limed Lakes.
W91-01073 2H

LIMITING NUTRIENTS

Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Rapid Ammonium Cycling and Concentration-Dependent Partitioning of Ammonium and Phosphate: Implications for Carbon Transfer in Planktonic Communities.
W91-01043 2H

Microalgal Growth Model.
W91-01140 2L

Seasonal Patterns of Grazing and Nutrient Limitation of Phytoplankton in a Eutrophic Lake.
W91-01144 2H

Role of Nutrition in Regulating the Population Dynamics of Opportunistic, Surface Deposit Feeders in a Mesohaline Community.
W91-01145 2L

Phosphate Limitation in Estuarine and Coastal Waters of China.
W91-01923 2L

Phytoplankton Biomass and Potential Nutrient Limitation of Phytoplankton Development in the Southeastern North Sea in Spring 1985 and 1986.
W91-01937 2L

LIMNOLOGY

Modeling Linked Watershed and Lake Processes for Water Quality Management Decisions.
W91-01012 5C

Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

Mechanism for the Hydrogen Sulfide-Induced Growth Limitation in Wetland Macrophytes.
W91-01042 2H

Rapid Ammonium Cycling and Concentration-Dependent Partitioning of Ammonium and Phosphate: Implications for Carbon Transfer in Planktonic Communities.
W91-01043 2H

Distribution of Labile Dissolved Organic Carbon in Lake Michigan.
W91-01044 2H

Abiotic Transformations of Iron and Phosphate in Humic Lake Water Revealed by Double-Isotope Labeling and Gel Filtration.
W91-01048 2H

Variability of Diatom Concentrations and Accumulation Rates in Sediments of a Small Lake Basin.
W91-01049 2H

Greigite and the Magnetic Properties of Sediments.
W91-01050 2H

Contribution of Organic Acids to Alkalinity in Lakes Within the Mount St. Helens Blast Zone.
W91-01051 2H

Cadmium Concentrations of Crustacean Zooplankton of Acidified and Nonacidified Canadian Shield Lakes.
W91-01062 5B

Seasonal Variations of Population Density and Activity of Sulfate-Reducing Bacteria in Offshore and Reed Sediments of a Hypertrophic Freshwater Lake.
W91-01072 2H

Importance of Natural Processes in Understanding Ecosystem Change: A Case Study of Limed Lakes.
W91-01073 2H

Nutrient Dynamics in a Floating Mat and Pond System with Special Reference to Its Vegetation.
W91-01126 2H

Microalgal Growth Model.
W91-01140 2L

Nitrification in Nitrate-Rich Streams: Diurnal and Seasonal Variation Related to Benthic Oxygen Metabolism.
W91-01142 2H

Comparison of the Acidification Efficiencies of Nitric and Sulfuric Acids by Two Whole-Lake Addition Experiments.
W91-01143 5B

Seasonal Patterns of Grazing and Nutrient Limitation of Phytoplankton in a Eutrophic Lake.
W91-01144 2H

Phytic Alkaline Phosphatase on Natural and Artificial Plants in an Oligotrophic Lake: Regulation of the Role of Macrophytes as a Phosphorus Source for Epiphytes.
W91-01146 2H

Anomalous Temperature and Oxygen Gradients under the Ice of a High-Plains Lake in Wyoming.
W91-01148 2H

Water Quality Evaluation in Lakes of Greece.
W91-01212 2H

Eutrophication: Assessment, Research and Management with Special Reference to Scotland's Freshwaters.
W91-01277 5C

Advances in Estimating Bacterial Biomass and Growth in Aquatic Systems.
W91-01334 5A

Epilimnetic Carbon Flux and Turnover of Different Particle Size Classes in Oligo-Mesotrophic Lake Lucerne, Switzerland.

Development of an Expert System Embedding Pattern Recognition Technique for Groundwater Pollution Source Identification.
W91-01825 5B

Simulation of Ground-Water Flow in Aquifers in Cretaceous Rocks in the Central Coastal Plain, North Carolina.
W91-01843 2F

Are Mathematical Models Useful for Understanding Water Acidification.
W91-01894 5B

Pentachlorophenol: Environmental Partitioning and Human Exposure.
W91-02016 5B

MAYFLIES
Associations of Aquatic Insects (Ephemeroptera, Plecoptera, and Trichoptera) in a Network of Subarctic Lakes and Streams in Quebec.
W91-01349 2H

MEANDERS
Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

Channel Avulsion and River Metamorphosis: The Case of the Thomson River, Victoria, Australia.
W91-01879 2E

MEASURING INSTRUMENTS
Evaluation of Biologically Harmful Ultraviolet Radiation in Antarctica with a Biological Dosimeter Designed for Aquatic Environments.
W91-01138 7B

Simultaneous Dual Column, Dual-Detector Gas Chromatographic Determination of Chlorinated Pesticides and Polychlorinated Biphenyls in Environmental Samples.
W91-01281 5A

Design for an Occult Precipitation Collector.
W91-01291 7B

Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Monitoring the State of the Dam of the Sayano-Shushenskoe Hydroelectric Station.
W91-01541 8A

Experience in Using Digital Voltmeters in the System Measuring the Pool Levels and Head at Hydroelectric Stations.
W91-01546 8G

Measuring Techniques for Gas/Solid Fluidized Bed Reactors (MeBtechniken fur Gas/Feststoff-Wirbelschichtreaktoren).
W91-01896 5D

Shot-Sensor Method of Measuring Currents in Shallow Estuarine Waters.
W91-01900 7B

MEDITERRANEAN SEA
Temporal and Spatial Characteristics of Annual Precipitation over the Balkans in the Twentieth Century.
W91-01467 2B

MELTING
Influence of Hudson Bay Runoff and Ice-Melt on the Salinity of the Inner Newfoundland Shelf.
W91-01432 2E

MELVILLE ISLAND
Surface Energy Balance of a Perennial Snowbank, Melville Island, Northwest Territories, Canada.
W91-01370 2C

MEMBRANE FILTERS
Application of a Hollow-Fiber, Tangential-Flow Device for Sampling Suspended Bacteria and Particles from Natural Waters.
W91-01031 5A

Applications of Advanced Membrane Filtration to Industrial Wastewater Treatment and Groundwater Clean-up.
W91-01965 5D

MEMBRANE PROCESSES
Removal of Organics from Offshore Produced Waters Using Nanofiltration Membrane Technology.
W91-01951 5D

Characterization of Desalting Concentrates.
W91-01976 3A

Irrigation with Membrane Plant Concentrate: Fort Myers Case Study.
W91-01981 3C

MERCURY
Mercury Speciation in Surface Freshwater Systems in California and Other Areas.
W91-01063 2K

LIBRARY U. OF I. URBANA-CHAMP.

MERCURY

Fixed Bed Adsorption for the Removal of Pollutants from Water.
W91-01110 5F

Studies on the Ability of Water Hyacinth (Eichhornia crassipes) to Bioconcentrate and Biomonitor Aquatic Mercury.
W91-01112 5A

Effect of Mercury and Selenium on the Gill Function of Mytilus edulis.
W91-01159 5C

Mercury Content of Swordfish, Xiphias gladius, in Relation to Length, Weight, Age, and Sex.
W91-01160 5B

Mercury near a Caustic Soda Plant at Karwar, India.
W91-01163 5B

Modified Hardwickia binata Bark for Adsorption of Mercury (II) from Water.
W91-01422 5D

Speciation of Mercury Compounds in Waste Water by Microcolumn Liquid Chromatography Using a Preconcentration Column with Cold-Vapor Atomic Absorption Spectrometric Detection.
W91-01716 5A

Mercury, Cadmium and Lead in Eels and Roach: The Effects of Size, Season, and Locality on Metal Concentrations in Flesh and Liver.
W91-01821 5B

Mercury, Cadmium and Lead Concentrations in Five Species of Freshwater Fish from Eastern England.
W91-01822 5B

Behavior of Heavy Metals During Wastewater Treatment, III. Mercury and Arsenic.
W91-02014 5D

MESOTROPHIC LAKES

Epilimnetic Carbon Flux and Turnover of Different Particle Size Classes in Oligo-Mesotrophic Lake Lucerne, Switzerland.
W91-01335 5B

Occurrence of Heavy Metals in Water, Phytoplankton, and Zooplankton of a Mesotrophic Lake in Eastern Poland.
W91-01891 5B

Accumulation of Heavy Metals in a Lake Ecosystem.
W91-01892 5B

METABOLISM

Inhibitory Effects of High Molecular Weight Dissolved Organic Matter Upon Metabolic Processes in Biofilms from Contrasting Rivers and Streams.
W91-01345 2K

Uptake and Elimination of Waterborne Cadmium by the Fish Noemacheilus barbatulus L. (Stone Loach).
W91-02023 5C

METABOLITES

Persistent Metabolites of Alkylphenol Polyethoxylates in the Marine Environment.
W91-01754 5B

METAL COMPLEXES

Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

Copper Toxicity to Paratya australiensis: II. Influence of Bicarbonate and Ionic Strength.
W91-01259 5C

Copper Toxicity to Paratya australiensis: III. Influence of Dissolved Organic Matter.
W91-01260 5C

METAL-FINISHING WASTES

Interaction Between Components of Electroplating Industry Wastes, Influence of the Receiving Water on the Toxicity of the Effluent.
W91-01106 5C

Minimization of Chromium-Contaminated Wastewater at a Plating Facility in the Eastern United States.
W91-01947 5D

METALLOTHIONEINS

Effects of Cadmium on Murex trunculus from the Adriatic Sea: I. Accumulation of Metal and Binding to a Metallothionein-like Protein.
W91-02020 5B

METALS

Surface Ionization of Polynuclear Species in Al(III) Hydrolysis--I. Titration Results.
W91-01413 5F

Surface Ionization of Polynuclear Species in Al(III) Hydrolysis--II. A Conditional Equilibrium Model.
W91-01414 5F

Sequentially Extracted Metals in Adirondack Lake Sediment Cores.
W91-01500 2H

Measurement and Interpretation of Low Levels of Dissolved Oxygen in Ground Water.
W91-01788 7B

Interpretation of Metal Concentrations in Estuarine Sediments of Florida Using Aluminum as a Reference Element.
W91-01898 2L

Mass-Balance of Metals and Identification of Their Sources in Both River and Fallout Fluxes Near Gdansk Bay, Baltic Sea.
W91-02007 5B

METEOROLOGICAL DATA

Supporting World Hydrology: Activities of International Hydrological Programs.
W91-01457 6E

Prediction Model for Snowmelt, Snow Surface Temperature and Freezing Depth Using a Heat Balance Method.
W91-01469 2C

Further Exploratory Evaluations of Grossversuch IV Using Hailpad Data: Analysis of Hail Patterns and Stratification by Storm Type for Seeding Effect.
W91-01471 2B

Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Persistence of Seeding Effects in a Winter Orographic Cloud Seeded with Silver Iodide Burned in Acetone.
W91-01473 3B

Entrainment and Mixing Processes as Related to Droplet Growth in Warm Midlatitude and Tropical Clouds.
W91-01657 2B

METEOROLOGICAL DATA COLLECTION

Use of Daily Values of Surface Parameters at Durban and Cape Town to Determine the Precipitable Water Content of the Atmosphere.
W91-01660 2B

METEOROLOGY

Radar Observations of Precipitation Production in Thunderstorms.
W91-01430 2B

Time Scales and Variability of Area-Averaged Tropical Oceanic Rainfall.
W91-01446 2B

Thunderstorms above Frontal Surfaces in Environments without Positive CAPE. Part I: A Climatology.
W91-01481 2B

Thunderstorms above Frontal Surfaces in Environments without Positive CAPE. Part II: Organization and Instability Mechanisms.
W91-01482 2B

Precipitation and Environmental Conditions during Accretion in Canadian East Coast Winter Storms.
W91-01487 2B

Aircraft-based Radiometric Imaging of Tropospheric Temperature and Precipitation Using the 118.75-GHz Oxygen Resonance.
W91-01488 7B

Thunderstorms, Cosmic Rays, and Solar-Lunar Influences.
W91-01490 2B

Monitoring of Rainfall in Relation to the Control of Migrant Pests.
W91-01561 2E

New Equation for the Atmospheric Energy Budget (Eine Neue Gleichung fuer die Atmosphaerischen Energiehaushaelte).
W91-01581 2E

Changeable Weather-A Chaotic Phenomenon Triggered off by Mesoscale Precipitation-Eddies (Wetterlaunen als Chaotische Meso-Skalige Strukturen).
W91-01582 2I

Use of Polarization to Characterize Precipitation and Discriminate Large Hail.
W91-01656 2

Precipitation Production in a Large Montana Hailstorm: Airflow and Particle Growth Trajectories.
W91-01658 2

Use of Daily Values of Surface Parameters at Durban and Cape Town to Determine the Precipitable Water Content of the Atmosphere.
W91-01660 2

Perspective on El Nino and La Nina: Global Implications for Stream Ecology.
W91-01811 2

Chemical Composition of Bulk Precipitation Across the Mountains of Snowdonia, U.K.
W91-01820 2

METHANE

Methane Emissions from Fen, Bog and Swamp Peatlands in Quebec.
W91-01719

Distribution and Rate of Methane Oxidation in Sediments of the Florida Everglades.
W91-01763

METHANE BACTERIA

Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part 2, Results of Biostimulation and Biotransformation Experiments.
W91-01299

METHANOGENESIS
Start-Up of Low Temperature Anaerobic Reactors Using Freshwater Methanogenic Sediments.
W91-01637 5D

Methane Emissions from Fen, Bog and Swamp Peatlands in Quebec.
W91-01719 5B

METHANOL
Effects of Organic Substrates on Dechlorination of Aroclor 1242 in Anaerobic Sediments.
W91-01758 5B

METHYLENE BLUE
Responses of Plankton and Nutrients to Methylene Blue-Photosensitized Lake Restoration.
W91-01736 5G

METOLACHLOR
Metolachlor Transport in Surface Runoff.
W91-01020 5B

METROPOLITAN WATER MANAGEMENT
Upgrading Antique Sewers.
W91-01484 5B

Downstream of the Novosibirsk Hydroelectric Station on the Ob River.
W91-01544 4A

Infrastructure--Weathering a Boom-and-Bust Development Cycle.
W91-01555 6B

Implementation of On-Line Control Scheme for City Water System.
W91-01559 5F

Industrial Pretreatment: Cooperation--To a Point...
W91-01565 5D

Measuring the Productivity of Construction Maintenance Operations.
W91-01749 5F

MEUSE RIVER
Trends in the Heavy Metal Levels in the Dissolved and Particulate Phase in the Dutch Rhine-Meuse (Maas) Delta.
W91-01817 5B

MICHIGAN
Nitrification in Sludge-Amended Michigan Forest Soils.
W91-01029 5E

Water Resources Data for Michigan, Water Year 1989.
W91-01864 7C

MICROBIAL DEGRADATION
Measurement of Exoenzymatic Activity in Streambed Sediments Using Methylumbelliferyl-Substrates.
W91-01587 2J

Effects of Organic Substrates on Dechlorination of Aroclor 1242 in Anaerobic Sediments.
W91-01758 5B

Effect of Sulfate and Organic Carbon Supplements on Reductive Dehalogenation of Chloroanilines in Anaerobic Aquifer Slurries.
W91-01760 5B

Degradation of Phenol by a Bacterial Consortium Under Methanogenic Conditions.
W91-01773 5D

Volatilization of Selenium from Agricultural Evaporation Pond Sediments.
W91-01814 5G

Simple and Rapid Method for Screening of Heavy Oil-Degrading Bacteria from Marine Environment.
W91-01961 5G

MICROBIOLOGICAL STUDIES
Microorganisms in Marine Sediments: Considerations Concerning Activity Measurements.
W91-01585 2J

Method of Measuring the Dehydrogenase Activity of Sediments.
W91-01588 2J

Autotrophic and Heterotrophic ATP Pools in Microbial Communities: Suggestions for Separation and for Bacterial Growth Rate Evaluation.
W91-01595 5A

MICROBIOLOGY
Microbiology of Foaming in Activated Sludge Plants.
W91-01654 5D

MICROCOMPUTERS
PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

MICROORGANISMS
Microorganisms in Marine Sediments: Considerations Concerning Activity Measurements.
W91-01585 2J

Method of Measuring the Dehydrogenase Activity of Sediments.
W91-01588 2J

Microbiology of Foaming in Activated Sludge Plants.
W91-01654 5D

Seasonal Variation of Thermophilic Campylobacters in Sewage Sludge.
W91-01655 5B

Rates of Protozoan Bacterivory in Three Habitats of a Southeastern Blackwater River.
W91-01809 2H

Comparative Toxicities of Selected Industrial Chemicals to Microorganisms and Other Aquatic Organisms.
W91-02041 5C

MIDA CREEK
Marine Reserve Management in Developing Nations: Mida Creek--A Case Study from East Africa.
W91-01121 6E

MIDGES
Growth and Voltinism of Lotic Midge Larvae: Patterns Across an Appalachian Mountain Basin.
W91-01038 2H

Fate of Macrozoobenthos in Hypertrophic Lakes: In Situ Rearing Experiments with the Larvae of Tokunagayusurika akamusi (Chironomidae).
W91-01769 5C

Morphological Deformities in Chironomidae(Diptera) Larvae from the Lac St. Louis and Laprairie Basins of the St. Lawrence River.
W91-01790 5C

Acute Toxicity of Selected Herbicides and Surfactants to Larvae of the Midge Chironomus riparius.
W91-02017 5C

MINE DRAINAGE
Effect of Environmental Storage Conditions on the Organic Content of Simulated Coal Leachates.
W91-01689 5G

MINE WASTES
Unexpected Hydrologic Perturbation in an Abandoned Underground Coal Mine: Response to Surface Reclamation.
W91-01098 4C

Buffering Capacity of Coal Mine Spoils and Fly Ash as a Factor in the Protection of the Aquatic Environment.
W91-01455 5G

Invertebrate Communities of Small Streams in Northeastern Wyoming.
W91-01850 2H

Prediction of Mine Drainage Quality in Pennsylvania.
W91-01963 5B

MINERALIZATION
Variations in Sedimentary Carbon Remineralization Rates in the White Oak River Estuary, North Carolina.
W91-01040 2L

Input and Mineralization of Organic Carbon in Lakes.
W91-01601 2H

MINERALOGY
Multivariate Statistical Analyses of Sediment Geochemistry.
W91-01161 2L

Rain Scavenging of Tephra Aerosols from Mount St. Helens 1980 Eruptions.
W91-01468 2B

MINKE WHALES
Heavy Metal Accumulations and Their Recent Changes in Southern Minke Whales Balaenoptera acutorostrata.
W91-01969 5B

MINNESOTA
Modeling Linked Watershed and Lake Processes for Water Quality Management Decisions.
W91-01012 5G

MINNOW
Interactions Between Bacillus thuringiensis subsp. israelensis and Fathead Minnows, Pimephales promelas Rafinesque, Under Laboratory Conditions.
W91-01759 5B

MISSISSIPPI RIVER
Occurrence, Distributions, and Transport of Herbicides and Their Degradation Products in the Lower Mississippi River and Its Tributaries.
W91-01064 5B

Processes Governing Marsh Formation in a Rapidly Subsiding Coastal Environment.
W91-01088 2L

MISSOURI RIVER
Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

MIST
Design for an Occult Precipitation Collector.
W91-01291 7B

MIXING
Mixing in Overland Flow During Rainfall.
W91-01153 5B

Genesis of Free Hydraulic Jumps for Better Mixing.
W91-01421 5F

Entrainment and Mixing Processes as Related to Droplet Growth in Warm Midlatitude and Tropical Clouds.
W91-01657 2B

Modeling of Wind-Induced Destratification in Chesapeake Bay.
W91-01899 2L

LIBRARY U. OF L. WATER CENTER

MOBILE BAY
Temporal Variability of Remotely Sensed Suspended Sediment and Sea Surface Temperature Patterns in Mobile Bay, Alabama.
W91-01131 2L

MODEL STUDIES
Modeling Linked Watershed and Lake Processes for Water Quality Management Decisions.
W91-01012 5G

Identifying Flow Paths in Models of Surface Water Acidification.
W91-01033 5B

Household Exposure Models.
W91-01076 5C

Application of a Simple Lumped River Flow Forecasting Model to Hillslope Soil Water Storage Estimation.
W91-01086 2G

Integrated Analysis of Policy Options for Protection of Groundwater Quality.
W91-01101 5G

Predicting Water Use and Water Application Efficiencies for Different Irrigation Depths in Wheat.
W91-01115 3F

Test of the Assumptions and Predictions of Recent Microalgal Growth Models with the Marine Phytoplankter Pavlova lutheri.
W91-01139 2L

Microalgal Growth Model.
W91-01140 2L

Denitrification in Nitrate-Rich Streams: Diurnal and Seasonal Variation Related to Benthic Oxygen Metabolism.
W91-01142 2H

Mixing in Overland Flow During Rainfall.
W91-01153 5B

Proceedings of Stormwater and Water Quality Model Users Group Meeting.
W91-01188 5G

Revised Runoff Block of SWMM.
W91-01190 4C

Modeling Studies for the City of Austin Stormwater Monitoring Programs.
W91-01194 4C

Application of SWMM in the New Orleans Area.
W91-01195 4C

Application of QUAL II to Explore Wasteload Allocation Alternatives.
W91-01197 5G

Application of the HSPF Model to Water Management in Africa.
W91-01199 6B

Modeling and Field Evaluations of Urban Wet Detention Ponds.
W91-01201 4C

Hyetograph Compositing Effects on Urban Runoff Modelling.
W91-01206 7C

Flood Hydrograph for Ungaged Watershed.
W91-01207 7C

Use of a Compartmental Model to Develop Rules for the Interpretation of Water Quality Data.
W91-01214 5B

Hydrolysis of Chlorostilbene Oxide: II. Modeling of Hydrolysis in Aquifer Samples and in Sediment-Water Systems.
W91-01256 5B

Analysis of RADM Gas Concentration Predictions Using OSCAR and NEROS Monitoring Data.

Equilibrium Partitioning and Bioaccumulation of Sediment-Associated Contaminants by Infaunal Organisms.
W91-01267 5B

Relative Sensitivities of Different Life Stages of Isognomon californicum to Cadmium Toxicity.
W91-01308 5C

Species-Related Variations of Silver Bioaccumulation and Toxicity to Three Marine Bivalves (Variations Inter-Specifiques de la Bioaccumulation et de la Toxicite de L'Argent a L'Egard de Trois Mollusques Bivalves Marins).
W91-01420 5B

Butyltins in Sediments and Bivalves from U.S. Coastal Areas.
W91-01735 5B

NOAA's Status and Trends Mussel Watch Program: Chlorinated Pesticides and PCBs in Oysters (Crassostrea virginica) and Sediments from the Gulf of Mexico.
W91-01933 5A

Effects of Cadmium on Murex trunculus from the Adriatic Sea: I. Accumulation of Metal and Binding to a Metallothionein-like Protein.
W91-02020 5B

Effects of Cadmium on Murex trunculus from the Adriatic Sea: II. Oxygen Consumption and Acclimation Effects.
W91-02021 5C

Shell as a Site of Lead Deposition in Helix aspersa.
W91-02025 5B

Physiological Responses to Severe Acid Stress in Four Species of Freshwater Clams (Unionidae).
W91-02026 5C

Recent Taxonomic Discoveries Concerning the Mussel Mytilus: Implications for Biomonitoring.
W91-02030 5A

Comparative Toxicokinetics of 2,2'-Dichlorobiphenyls and 4,4'-Dichlorobiphenyls in the Pond Snail Lymnaea stagnalis.
W91-02036 5C

MOLYBDENUM
Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Acute Toxicity of Boron, Molybdenum, and Selenium to Fry of Chinook Salmon and Coho Salmon.
W91-01313 5C

LIBRARY U. OF I. URBANA-CHAMP.

MONGOLIA
Soda Lakes on Inner Mongolia Plateau, China.
W91-01574 2H

MONITORING
Studies on the Ability of Water Hyacinth (Eichhornia crassipes) to Bioconcentrate and Biomonitor Aquatic Mercury.
W91-01112 5A

Modeling Studies for the City of Austin Stormwater Monitoring Programs.
W91-01194 4C

Ecological Monitoring: The Need for a Standard.
W91-01216 5G

Necessity of Bioassays in Water Quality Monitoring.
W91-01225 5A

Fish Health and Environmental Health.
W91-01376 5C

Integration of Long-Term Fish Kill Data with Ambient Water Quality Monitoring Data and Application to Water Quality Management.
W91-01635 5C

Hydrogeologic, Water-Level, and Water-Quality Data from Monitoring Wells at the U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-01844 5B

Acid Precipitation Monitoring and Research. Review of Current Norwegian Activities.
W91-01888 5G

Acid Precipitation: Biological Monitoring of Streams and Lakes.
W91-01890 5A

Environmental Testing-Issues and Directions.
W91-01913 5G

MONTANA
Hydrology of the Powder River Alluvium Between Sussex, Wyoming, and Moorhead, Montana.
W91-01852 2F

MONTE CARLO METHOD
Stochastic Analysis of Unsaturated Flow: One-Dimensional Monte Carlo Simulations and Comparisons With Spectral Perturbation Analysis and Field Observations.
W91-01536 2G

MORAINES
Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.
W91-01651 8D

MORICE RIVER
Floodplain Dynamics of a Wandering River, Dendochronology of the Morice River, British Columbia, Canada.
W91-01070 2E

MORLAIX ESTUARY
Mathematical Model of Bacterial Contamination of the Morlaix Estuary (France).
W91-01419 5B

MORPHOLOGY
Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

MORTALITY
Ecological Correlation Between Arsenic Level in Well Water and Age-adjusted Mortality from Malignant Neoplasms.
W91-01292 5C

Effect of Tidal Flooding on Mortality of Juvenile Muskrats.
W91-01910 2L

MOSQUITOES
Mosquito Control in Wastewater: A Controlled and Quantitative Comparison of Pupfish (Cyprinodon nevadensis amargosae), Mosquitofish (Gambusia affinis) and Guppies (Poecilia reticulata) in Sago Pondweed Marshes.
W91-01988 5D

MOUNT ST HELENS
Contribution of Organic Acids to Alkalinity in Lakes Within the Mount St. Helens Blast Zone.
W91-01051 2H

MOUNTAIN LAKES
Contribution of Organic Acids to Alkalinity in Lakes Within the Mount St. Helens Blast Zone.
W91-01051 2H

Anomalous Temperature and Oxygen Gradients Under the Ice of a High-Plains Lake in Wyoming.
W91-01148 2H

Phytoplankton Dynamics in Three Rocky Mountain Lakes, Colorado, U.S.A.
W91-01368 5C

MOUNTAIN STREAMS
Streamwater acidification in Relation to Acid Precipitations--Vegetation and Bedrock Influences, Consequences for Trout Populations: The Vosges Massif Case Study (Acidification des eaux de Surface sous L'Influence des Precipitations Acides : Role de la Vegetation et du Substratum, Consequences pour les Populations de Truites. Le Cas des Ruisseaux des Vosges).
W91-01738 5C

Redd Site Selection by Brown Trout in Douglas Creek, Wyoming.
W91-01745 8I

Effects of Acidification on Leaf Decomposition in Streams.
W91-01803 5C

MOUNTAINS
Seasonal Description of the Quality and Quantity of Snowmelt in a Mountainous Region Using an Integrated Model.
W91-01460 2C

MUD
Mud Balance for Belgian-Dutch Coastal Waters Between 1969 and 1986.
W91-01934 2J

MULCHES
Triazine Herbicide Fate in a No-Tillage Corn (Zea mays L.)-Crownvetch (Coronilla varia L.) 'Living Mulch' System.
W91-01709 5B

MULTIPHASE FLOW
Two-Phase Relative Permeability and Capillary Pressure of Rough-Walled Rock Fractures.
W91-01511 2F

MULTIPURPOSE RESERVOIRS
Real-time Multipurpose Reservoir Operation: A Case Study.
W91-01464 4A

MULTIRESERVOIR NETWORKS
Prioritizing Flow Alternatives for Social Objectives.
W91-01552 6G

MULTIVARIATE ANALYSIS
Ecology of Two Intermittent Streams in Victoria, Australia. I. Multivariate Analyses of Physicochemical Features.
W91-01344 2E

Application of Multivariate Analysis for Characterization of Organic Compounds from Urban Runoff.
W91-02004 5A

MUNICIPAL WASTES
Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

MUNICIPAL WASTEWATER
Removal of Organohalogens and Organohalogen Precursors in Reclaimed Wastewater--I.
W91-01415 5D

Removal of Organohalogens and Organohalogen Precursors in Reclaimed Wastewater--II.
W91-01416 5D

MUSCLE
Mercury, Cadmium and Lead in Eels and Roach: The Effects of Size, Season, and Locality on Metal Concentrations in Flesh and Liver
W91-01821 5B

MUSKRATS
Effect of Tidal Flooding on Mortality of Juvenile Muskrats.
W91-01910 2

MUSSELS
Effect of Mercury and Selenium on the G Function of Mytilus edulis.
W91-01159 5

Use of the Mussel Watch and Molecular Mark Concepts in Studies of Hydrocarbons in a Tro cal Bay (Todos os Santos, Bahia, Brazil).
W91-01690 5

Studies on the Chemistry of Interstitial Wat Taken from Defined Horizons in the Fine Se ments of Bivalve Habitats in Several Northe German Lowland Waters: I. Sampling Tec niques.
W91-01768 2

Effect of Heavy Metals on the Serotonin a Dopamine Systems in the Central Nervo System of the Freshwater Mussel (Anodo cygnea L).
W91-01776

NOAA's Status and Trends Mussel Watch P gram: Chlorinated Pesticides and PCBs in O ters (Crassostrea virginica) and Sediments fr the Gulf of Mexico.
W91-01933

Recent Taxonomic Discoveries Concerning Mussel Mytilus: Implications for Biomonitori
W91-02030

MUTAGENICITY
Biotesting of Wastewater: A Comparative St Using the Salmonella and CHO Assay Syste
W91-01184

Interface of Health Effects and Chemistry Water Treatment Plants.
W91-01226

Occurrence of the Mutagenic Compound M Drinking Water and Its Removal by Activ Carbon.
W91-01643

Mutagenic Activity of Surface Waters Adja to a Nuclear Fuel Processing Facility.
W91-01972

MUTAGENS
Recovery of 3-Chloro-4-(dichloromethyl)-5 droxy-2(5H)-furanone from Water Sample XAD Resins and the Effect of Chlorine o Mutagenicity.
W91-01181

Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

MYTILUS
Spatial and Seasonal Differences in the PCB Content of the Mussel Mytilus edulis.
W91-01819 5B

Effect of Heavy Metals on Bay Scallops, Surf Clams, and Blue Mussels in Acute and Long-term Exposures.
W91-01973 5C

APHTHOFLAVONE
Interaction of Carbon Tetrachloride with Beta-Naphthoflavone-Mediated Cytochrome P450 Induction in Winter Flounder (Pseudopleuronectes americanus).
W91-01279 5C

APHTHOQUINONES
Acute Toxicities and Hematological Effects of Two Substituted Naphthoquinones in Channel Catfish.
W91-01970 5C

APROPAMIDE
Sorption of Napropamide on Clay and Soil in the Presence of Dissolved Organic Matter.
W91-01023 5B

ATIONAL RIVERS INVENTORY
Perspective on America's Vanishing Streams.
W91-01812 6G

EBRASKA
Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

Water Resources Data for Nebraska, Water Year 1989.
W91-01829 7C

Development of Methodology and Criteria for Irrigation Management Under Limited Water Conditions.
W91-01853 3F

GEV REGION
Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695 2J

RVOUS SYSTEM
Effect of Heavy Metals on the Serotonin and Dopamine Systems in the Central Nervous System of the Freshwater Mussel (Anodonta cygnea L).
W91-01776 5B

THERLANDS
Presence of Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans in Fish-Eating Birds and Fish from the Netherlands.
W91-01966 5B

WORK DESIGN
Per Defined Conduits in the EXTRAN Block SWMM.
W91-01189 4C

Mean Square Error of Regression-Based Constituent Transport Estimates.
W91-01522 5B

Water-Resources Data-Network Evaluation for Monterey County, California, Phase 3: Northern Salinas River Drainage Basin.
W91-01836 7A

ADA
Seasonal and Long-Term Trends in Truckee River Nutrient Concentrations and Truckee River Nutrient Concentrations and Loadings to Pyramid Lake, Nevada: A Terminal Saline Lake.
W91-01425 5B

Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

NEW CALEDONIA
Contribution of Benthic Biomass to Overall Metabolism in New Caledonia Lagoon Sediments.
W91-01659 2L

NEW ENGLAND
Utility of Scaled Chrysophytes for Inferring Lakewater pH in Northern New England Lakes.
W91-01502 2H

NEW HAMPSHIRE
Dry Deposition of Sulfur: a 23-Year Record for the Hubbard Brook Forest Ecosystem.
W91-01411 5B

NEW MEXICO
Water Resources Data for New Mexico, Water Year 1989.
W91-01828 7C

Microalgae Production and Shellfish Feeding Trials at the Roswell Test Facility.
W91-01867 3C

NEW ORLEANS
Application of SWMM in the New Orleans Area.
W91-01195 4C

NEW YORK
Paleoecological Investigation of Recent Lake Acidification in the Adirondack Mountains, N.Y.
W91-01499 5B

Sequentially Extracted Metals in Adirondack Lake Sediment Cores.
W91-01500 2H

Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

NEW ZEALAND
Siltation of Stone-Surface Periphyton in Rivers by Clay-Sized Particles from Low Concentrations in Suspension.
W91-01353 2J

Environmentalism, Policy Factors and the Courts in New Zealand.
W91-01622 6E

Comparing the Effects of Acidic Deposition on the Chemistry of Small Streams in the South Island of New Zealand With Those in the Fichtelgebirge, F.R.G.
W91-01870 5B

NEWFOUNDLAND
Influence of Hudson Bay Runoff and Ice-Melt on the Salinity of the Inner Newfoundland Shelf.
W91-01432 2E

NICKEL
Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Behavior of Heavy Metals During Wastewater Treatment, II. Lead, Nickel, and Zinc.
W91-02013 5D

NIGERIA
Water and Fertilizer Interrelations with Irrigated Maize.
W91-01408 3F

Strategy for Cost Recovery in the Rural Water Sector: A Case Study of Nsukka District, Anambra State, Nigeria.
W91-01510 6C

NILE RIVER
Revised Estimate of the Life Span for Lake Nasser.
W91-01884 2H

NITRATES
Nitrate Contamination of Groundwater under Irrigated Coastal Plain Soils.
W91-01015 5B

Nitrate Leaching from Systematically Tiled Potato Fields in New Brunswick, Canada.
W91-01016 5B

Well-Water Methaemoglobinaemia: The Bacterial Factor.
W91-01224 5C

Agriculture: A Positive Contribution to Water Quality.
W91-01249 5G

Nitrates in Ground Water.
W91-01681 5B

Role of Ammonium and Nitrate Retention in the Acidification of Lakes and Forested Catchments.
W91-01718 5B

Phosphate Limitation in Estuarine and Coastal Waters of China.
W91-01923 2L

Winter Distribution of Nutrients in the Southern Bight of the North Sea (1961-1978) and in Estuaries of the Scheldt and the Rhine/Muese.
W91-01936 2L

NITRIC ACID
Comparison of the Acidification Efficiencies of Nitric and Sulfuric Acids by Two Whole-Lake Addition Experiments.
W91-01143 5B

Rainwater Acidity at Jabiru, Australia, in the Wet Season of 1983/84.
W91-01818 5B

NITRIFICATION
Nitrification in Sludge-Amended Michigan Forest Soils.
W91-01029 5E

Oceanic and Estuarine Ammonium Oxidation: Effects of Light.
W91-01046 2L

Performance of Four Full-Scale Nitrifying Wastewater Treatment Plants Incorporating Selectors.
W91-01174 5D

Process Control Strategy for the Biological Reduction of Phosphorous and Ammonia Nitrogen Utilizing the A/O Process.
W91-01187 5D

Effect of Periodic Illumination on Nitrification in the Continuous Cultivation.
W91-01604 2H

NITRILOTRIACETIC ACID
Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

NITROGEN
Nitrogen Cycling in Louisiana Gulf Coast Brackish Marshes.
W91-01351 2L

LIBRARY U. OF I. URBANA-CHAMPAIGN

NITROGEN

Relations Between Acid Rain and Vesicular-Arbuscular Mycorrhiza.
W91-01410 5C

Seasonal and Long-Term Trends in Truckee River Nutrient Concentrations and Truckee River Nutrient Concentrations and Loadings to Pyramid Lake, Nevada: A Terminal Saline Lake.
W91-01425 5B

Effect of Feed Composition, Aerobic Volume Fraction and Recycle Rate on Nitrogen Removal in the Single-Sludge System.
W91-01426 5D

Control of Sludge Settling Characteristics in the Single-Sludge System, A Hypothesis.
W91-01427 5D

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: I. Soil Nitrogen and Heavy Metals.
W91-01503 5E

Contribution of Benthic Biomass to Overall Metabolism in New Caledonia Lagoon Sediments.
W91-01659 2L

Effect of Soil Water, Nitrogen, and Growing Degree-Days on Morphological Development of Crested and Western Wheat-Grass.
W91-01707 2I

Atmospheric Input of Inorganic Nitrogen Species to the Kiel Bight.
W91-01921 5B

Natural Abundance of 15N in Particulate Nitrogen and Zooplankton in the Chesapeake Bay.
W91-01928 2L

Denitrification and Nitrous Oxide in the North Sea.
W91-01935 5B

Primary Production and Nitrogen Assimilation in the North Sea During July 1987.
W91-01938 2L

NITROGEN COMPOUNDS

Atmospheric Input of Inorganic Nitrogen Species to the Kiel Bight.
W91-01921 5B

NITROGEN CYCLE

Nitrogen Cycling in Louisiana Gulf Coast Brackish Marshes.
W91-01351 2L

Fate of Added N-15 Labelled Nitrogen in a Sagittaria lancifolia L. Gulf Coast Marsh.
W91-01741 2H

NITROGEN FIXATION

Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Nitrogen Cycling in Louisiana Gulf Coast Brackish Marshes.
W91-01351 2L

NITROGEN OXIDES

Denitrification and Nitrous Oxide in the North Sea.
W91-01935 5B

NITROGEN REMOVAL

Advanced Nitrogen Removal Processes for Drinking and Waste Water Treatment.
W91-01247 5D

Control of Nitrogenous Pollution.
W91-01250 5D

Effect of Feed Composition, Aerobic Volume Fraction and Recycle Rate on Nitrogen Removal in the Single-Sludge System.
W91-01426 5D

Nitrates in Ground Water.
W91-01681 5B

NITZSCHIA

Timing of Wave Disturbance and the Resistance and Recovery of a Freshwater Epilithic Microalgal Community.
W91-01810 2H

NO-TILL CULTIVATION

Effect of Conventional vs. No-Tillage on Pesticide Leaching to Shallow Groundwater.
W91-01014 5B

NONIONIC SURFACTANTS

Persistent Metabolites of Alkylphenol Polyethoxylates in the Marine Environment.
W91-01754 5B

NONPOINT POLLUTION SOURCES

Nitrate Contamination of Groundwater under Irrigated Coastal Plain Soils.
W91-01015 5B

Nitrate Leaching from Systematically Tiled Potato Fields in New Brunswick, Canada.
W91-01016 5B

Mixing in Overland Flow During Rainfall.
W91-01153 5B

Constraints on the Use of Models to Predict the Movement of Pesticides to Groundwater.
W91-01223 5B

Agriculture: A Positive Contribution to Water Quality.
W91-01249 5G

Physically Based Model for Predicting Solute Transfer From Soil Solution to Rainfall-Induced Runoff Water.
W91-01527 5B

Statistical Characteristics of Some Estimators of Sediment and Nutrient Loadings.
W91-01538 2J

Poison Runoff: New Answers to a Pervasive Problem.
W91-01623 5G

Nitrates in Ground Water.
W91-01681 5B

NONSTRUCTURAL ALTERNATIVES

Infrastructure--Weathering a Boom-and-Bust Development Cycle.
W91-01555 6B

NORTH AMERICA

Effect of Air Temperature on Growth of Largemouth Bass in North America.
W91-01396 2H

PIRLA Project (Paleoecological Investigation of Recent Lake Acidification): An Introduction to the Synthesis of the Project.
W91-01498 5B

NORTH CAROLINA

Variations in Sedimentary Carbon Remineralization Rates in the White Oak River Estuary, North Carolina.
W91-01040 2L

Balance of Representation in Water Planning: An Assessment of Experience from North Carolina.
W91-01059 6A

Evaluation of Detention Basin Performance in the Piedmont Region of North Carolina.
W91-01824 5G

Sediment Transport and Accretion and the Hydrologic Environment of Grove Creek Near Kenansville, North Carolina.
W91-01839 2J

Assessment of Hydrologic and Hydrogeologic Data at Camp Lejeune Marine Corps Base, North Carolina.
W91-01840 2F

Hydrogeology of Aquifers in Cretaceous and Younger Rocks in the Vicinity of Onslow and Southern Jones Counties, North Carolina.
W91-01841 2F

Simulation of Ground-Water Flow in Aquifers in Cretaceous Rocks in the Central Coastal Plain, North Carolina.
W91-01843 2I

Hydrogeologic, Water-Level, and Water-Quality Data from Monitoring Wells at the U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-01844 5

Recruitment Failure of the Bay Scallop, Argopecten irradians concentricus, During the First Red Tide, Ptychodiscus brevis, Outbreak Recorded in North Carolina.
W91-01908 5

NORTH DAKOTA

Water Resources of Codington and Grant Counties, South Dakota.
W91-01842 2

NORTH SEA

Environmental Impact of North Sea Oil.
W91-01329 5

Denitrification and Nitrous Oxide in the North Sea.
W91-01935

Winter Distribution of Nutrients in the Southern Bight of the North Sea (1961-1978) and in Estuaries of the Scheldt and the Rhine/Muese.
W91-01936

Phytoplankton Biomass and Potential Nutrient Limitation of Phytoplankton Development in the Southeastern North Sea in Spring 1985 and 1986.
W91-01937

Primary Production and Nitrogen Assimilation in the North Sea During July 1987.
W91-01938

Changes in Spatial Distribution of Primary Production, Photosynthetic Pigments and Phytoplankton Species Composition During Two Surveys in the German Bight.
W91-01939

Changes in Sublittoral Zoobenthos in the German Bight with Regard to Eutrophication.
W91-01940

Concentrations of Organochlorine Compounds in the Hermit Crab Pagurus bernhardus from the German Bight, December 1988 - May 1989.
W91-01941

NORWAY

Polychlorinated Dibenzofuran (PCDF) and Dibenzo-P-Dioxin (PCDD) Levels in Organisms and Sediments from the Frierfjord, Southern Norway.
W91-01726

Acid Precipitation Monitoring and Research Review of Current Norwegian Activities.
W91-01888

Acidification in Norway - Loss of Fish Populations and the 1000 Lake Survey 1986.
W91-01889 5C

Acid Precipitation: Biological Monitoring of Streams and Lakes.
W91-01890 5A

Assessment of Aluminum Mobilization and Pathways in the Birkenes Catchment, Southern Norway.
W91-01893 5B

Aluminum Mobilization in Soil and Stream Waters at Three Norwegian Catchments with Different Acid Deposition and Site Characteristics.
W91-01895 5B

Diel Variations in Photosynthetic Activity of Summer Phytoplankton in Lindaspollene, Western Norway.
W91-01930 2L

OVA SCOTIA
Evaluation of Designs of Periodic Count Surveys for the Estimation of Escapement at a Fishway.
W91-01384 7A

UCLEAR ACCIDENTS
Contamination of Bavarian Lakes After the Chernobyl Reactor Accident: A Two-Compartment Model Analysis.
W91-01185 5B

UCLEAR FUEL
Mutagenic Activity of Surface Waters Adjacent to a Nuclear Fuel Processing Facility.
W91-01972 5C

UCLEAR MAGNETIC RESONANCE
Investigation of the Metal-Algae Binding Site with 113-Cd Nuclear Magnetic Resonance.
W91-01060 5B

UCLEAR POWERPLANTS
Mechanical Equipment of the Tashlyk Pumped-Storage Hydroelectric Station and Aleksandrovka Hydro Development of the Southern Ukraine Power Complex.
W91-01644 8C

CLEAR REACTORS
Contamination of Bavarian Lakes After the Chernobyl Reactor Accident: A Two-Compartment Model Analysis.
W91-01185 5B

MERICAL ANALYSIS
Three-Dimensional Computation of Flow and ed Deformation.
W91-01493 2J

TRIENT CONCENTRATIONS
utrophication: Assessment, Research and Management with Special Reference to Scotland's reshwaters.
W91-01277 5C

ydraulic Shock Loadings of Wastewater reatment System to Urban Rainfall-Runoff Effets Chocs Hydrauliques des Eaux Usees de uissellemaent Pluvial Urbain sur un Systeme de raitement des Eaux).
W91-01638 5D

elenium as a Nutrient for Freshwater Bacterioankton and Its Interactions with Phosphorus.
W91-01802 2H

inter Distribution of Nutrients in the Southern ght of the North Sea (1961-1978) and in Estuies of the Scheldt and the Rhine/Muese.
W91-01936 2L

NUTRIENT CYCLING
Rapid Ammonium Cycling and Concentration-Dependent Partitioning of Ammonium and Phosphate: Implications for Carbon Transfer in Planktonic Communities.
W91-01043 2H

NUTRIENT REMOVAL
Growth and Value of Chlorella salina Grown on Highly Saline Sewage Effluent.
W91-01708 5D

NUTRIENT TRANSPORT
Nutrient Export in Stormflow Following Forest Harvesting and Site-Preparation in East Texas.
W91-01009 5B

Precipitation Nutrient Inputs in Semiarid Environments.
W91-01030 2B

Nutrient Dynamics in a Floating Mat and Pond System with Special Reference to Its Vegetation.
W91-01126 2H

Seasonal and Long-Term Trends in Truckee River Nutrient Concentrations and Truckee River Nutrient Concentrations and Loadings to Pyramid Lake, Nevada: A Terminal Saline Lake.
W91-01425 5B

Nutrient Exchanges Between the Water Column and a Subtidal Benthic Microalgal Community.
W91-01897 2H

NUTRIENTS
Precipitation Nutrient Inputs in Semiarid Environments.
W91-01030 2B

Estimation of Ammonification and Ammonium Assimilation in Surficial Coastal and Estuarine Sediments.
W91-01035 2L

Biogeochemistry of Carbon in the Amazon River.
W91-01039 5B

Variations in Sedimentary Carbon Remineralization Rates in the White Oak River Estuary, North Carolina.
W91-01040 2L

Distribution of Labile Dissolved Organic Carbon in Lake Michigan.
W91-01044 2H

Long Term Patterns in Nutrients, Phytoplankton and Zooplankton of Lake Kinneret and Future Predictions for Ecosystem Structure.
W91-01337 5C

Prediction of Phosphate Coprecipitation with Calcite in Freshwaters.
W91-01423 2H

Carbon Flux from Phytoplankton to Free-Living Bacterial DNA.
W91-01591 2H

Assimilation of Free Monosaccharides and Amino Acids Relative to Bacterial Production in Eutrophic Lake Water.
W91-01598 2H

Application of the Isotope Dilution Principle to the Determination of Substrate Incorporation by Aquatic Bacteria.
W91-01599 2H

Reaction of Microbial Periphyton to Substrate Concentration Changes in a Running Water Model.
W91-01603 2H

Bacterial Production and Respiration in the Lakes of Different Types.
W91-01611 2H

Responses of Plankton and Nutrients to Methylene Blue-Photosensitized Lake Restoration.
W91-01736 5G

Effect of Nutrient Content on Leaf Decomposition in a Coastal Plain Stream: A Comparison of Green and Senescent Leaves.
W91-01742 2H

Effects of Light, Temperature, Nitrate, Orthophosphate, and Bacteria on Growth of and Hepatotoxin Production by Oscillatoria agardhii Strains.
W91-01762 5B

Atmospheric Input of Inorganic Nitrogen Species to the Kiel Bight.
W91-01921 5B

NUTRITION
Role of Nutrition in Regulating the Population Dynamics of Opportunistic, Surface Deposit Feeders in a Mesohaline Community.
W91-01145 2L

OBSERVATION WELLS
Hydrogeologic, Water-Level, and Water-Quality Data from Monitoring Wells at the U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-01844 5B

OCEAN DUMPING
Consolidation and Contaminant Migration in a Capped Dredged Material Deposit.
W91-01453 5E

ODOR CONTROL
Field Performance of Activated Carbon Adsorption for Sewage Air.
W91-01155 5D

Odour Control for the 1990s--Hit or Miss.
W91-01275 5D

Desorption of Odor Substances from Water Bodies to the Atmosphere.
W91-01282 5G

Compost Odor Control Through Process Optimization.
W91-01662 5D

OFFSHORE PLATFORMS
Removal of Organics from Offshore Produced Waters Using Nanofiltration Membrane Technology.
W91-01951 5D

OHIO
Expert Testimony for the Plaintiffs in the Case that Brought Ohio Ground-Water Law into the 20th Century.
W91-01302 6E

Ground-Water Levels, Flow, and Specific Conductance in Unconsolidated Aquifers Near Lake Erie, Cleveland to Conneaut, Ohio, September 1984.
W91-01855 2F

OIL INDUSTRY
Environmental Impact of North Sea Oil.
W91-01329 5C

OIL POLLUTION
Polycyclic Aromatic Hydrocarbon Emissions from the Combustion of Crude Oil on Water.

PIKE

Mercury, Cadmium and Lead Concentrations in Five Species of Freshwater Fish from Eastern England.
W91-01822 5B

Toxicological Examination of Whitefish (Coregonus clupeaformis) and Northern Pike (Esox lucius) Exposed to Uranium Mine Tailings.
W91-02037 5C

PINE TREES

Effect of Irrigation with Sewage Effluent on Decomposition of Litter in Pinus radiata Forests.
W91-01067 3C

PIPE FLOW

Some Parameters of a Spreading Flow Beyond Pipe Conduits.
W91-01437 8B

Flow Induced Pipe Vibration During Its Sagging Process.
W91-01670 8B

PIPELINES

Flow Induced Pipe Vibration During Its Sagging Process.
W91-01670 8B

Causes of Temporal Variability of Lead in Domestic Plumbing Systems.
W91-01698 5B

PIPES

Grouting Slip Liners: The New Inside Story.
W91-01486 5D

Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.
W91-01651 8D

PISCICIDES

Benthic Community Structure and the Effect of Rotenone Piscicide on Invertebrate Drift and Standing Stocks in Two Papua New Guinea Streams.
W91-01767 2H

PLANKTON

Rapid Ammonium Cycling and Concentration-Dependent Partitioning of Ammonium and Phosphate: Implications for Carbon Transfer in Planktonic Communities.
W91-01043 2H

Occurrence of Limnic Micro-Crustaceans in Relation to pH and Humic Content in Swedish Water Bodies.
W91-01350 2H

Growth of Bacteria on Organic Matter Produced by Algae in Continuous Cultures.
W91-01589 2H

Bacterial Net Production Approaching Zero--A Frequent Phenomenon in Pelagic Environments.
W91-01606 2H

Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

Responses of Plankton and Nutrients to Methylene Blue-Photosensitized Lake Restoration.
W91-01736 5G

Selenium as a Nutrient for Freshwater Bacterioplankton and Its Interactions with Phosphorus.
W91-01802 2H

Accumulation of Heavy Metals in a Lake Ecosystem.
W91-01892 5B

Succession of the Plankton Community during Coastal Reclamation with the Solid Wastes.
W91-01943 5E

Change of Water Quality and Composition of Plankton in the Pond of Reclaimed Site.
W91-01944 5E

PLANNING

Multidimensional Simulation Applied to Water Resources Management.
W91-01508 6B

Mar del Plata Action Plan: Review of Progress of Implementation in Asia and the Pacific.
W91-01679 6B

Regional Overview of Water Quality Monitoring.
W91-01680 6B

PLANT GROWTH

Effect of Municipal Sewage Sludge Application on Growth of Two Reclamation Shrub Species in Copper Mine Spoils.
W91-01025 5B

Effects of Irrigation Methods on Growth, Yield and Consumptive Use of Water of Banana cv. Nendran Grown in Clay Loam Soils.
W91-01117 3F

Effects of Saline Water Irrigation on Growth and Mineral Distribution in Guar (Cyamopsis tetragonoloba (L.) Taub).
W91-01149 3C

Canopy Temperature as an Indicator of Differential Water Use and Yield Performance Among Wheat Cultivars.
W91-01407 3F

Influence of Organic Sediment Amendments on Growth and Tuber Production by Potamogeton pectinatus L.
W91-01740 2I

PLANT PHYSIOLOGY

Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800 2I

New Gene Sources for Development of Agronomic Plants with Tolerance to Drought and Other Abiotic Stresses.
W91-01859 3B

PLANT TISSUES

Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800 2I

PLANT UPTAKE

Plant Uptake of Pentachlorophenol from Sludge-Amended Soils.
W91-01027 5I

PLANT WATER POTENTIAL

Dynamics of Root and Shoot Growth of Barley Under Various Levels of Salinity and Water Stress.
W91-01409 3I

Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800 2

PLANT-WATER RELATIONSHIPS

New Gene Sources for Development of Agronomic Plants with Tolerance to Drought and Other Abiotic Stresses.
W91-01859 3

PLAYAS

Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695

PLUMBING

Biofilms: Detection, Implications and Solution
W91-01239

PLUTONIUM

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006

POLAND

Chemical Threat to the Environment in Poland
W91-01887

Occurrence of Heavy Metals in Water, Phytoplankton, and Zooplankton of a Mesotrophic Lake in Eastern Poland.
W91-01891

Mass-Balance of Metals and Identification of Their Sources in Both River and Fallout Flux Near Gdansk Bay, Baltic Sea.
W91-02007

POLARIMETRIC RADAR MEASUREMENTS

Use of Polarization to Characterize Precipitation and Discriminate Large Hail.
W91-01656

POLICY MAKING

Integrated Analysis of Policy Options for Protection of Groundwater Quality.
W91-01101

What Should Be Done to Mitigate Groundwater Contamination.
W91-01374

Implications of Climate Change for Fisheries Management Policy.
W91-01402

Comparative Analysis of State Environmental Policy.
W91-01630

Californiazation of Arizona Water Politics.
W91-01631 6B

POLITICAL ASPECTS
Chemical Threat to the Environment in Poland.
W91-01887 5B

POLLUTANT IDENTIFICATION
Application of a Hollow-Fiber, Tangential-Flow Device for Sampling Suspended Bacteria and Particles from Natural Waters.
W91-01031 5A

Multivariate Statistical Analyses of Sediment Geochemistry.
W91-01161 2L

Heavy Metal Concentration in Telescopium from Darwin Harbour, N.T., Australia.
W91-01164 5A

Nonpriority Analysis of the Wastewater Streams of Four Dye Manufacturing Facilities.
W91-01172 5A

Recovery of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone from Water Samples on XAD Resins and the Effect of Chlorine on Its Mutagenicity.
W91-01181 5A

Biotesting of Wastewater: A Comparative Study Using the Salmonella and CHO Assay Systems.
W91-01184 5E

Multi-Element Analysis of Natural Water Using Inductively Coupled Plasma-Source Mass Spectrometry (ICP-MS).
W91-01219 5A

Necessity of Bioassays in Water Quality Monitoring.
W91-01225 5A

Water Quality Standards for Bacteriophages.
W91-01238 5G

Beta-Glucuronidase as a Rapid Colorimetric Assay for E. Coli in Water and Sewage Samples.
W91-01242 5A

Rotavirus as a Viral Indicator in Shellfish.
W91-01243 5A

Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Simultaneous Dual Column, Dual-Detector Gas Chromatographic Determination of Chlorinated Pesticides and Polychlorinated Biphenyls in Environmental Samples.
W91-01281 5A

Desorption of Odor Substances from Water Bodies to the Atmosphere.
W91-01282 5G

Analysis of 228Ra and 226Ra in Public Water Supplies by a Gamma-Ray Spectrometer.
W91-01667 5A

Characterization of Genotoxic Components in Sediments by Mass Spectrometric Techniques Combined with Salmonella/Microsome Test.
W91-01686 5A

Use of the Mussel Watch and Molecular Marker Concepts in Studies of Hydrocarbons in a Tropical Bay (Todos os Santos, Bahia, Brazil).
W91-01690 5A

GC-MS Identification of Gaseous Volatiles in Wastewater.
W91-01696 5A

Exchangeable Immobilized Enzyme Reactor for Enzyme Inhibition Tests in Flow-Injection Analysis Using a Magnetic Device. Determination of Pesticides in Drinking Water.
W91-01710 5A

On-Line Continuous-Flow Extraction System in Liquid Chromatography with Ultraviolet and Mass Spectrometric Detection for the Determination of Selected Organic Pollutants.
W91-01711 5A

Detection of Organic Toxic Pollutants in Water and Waste-Water by Liquid Chromatography and In Vitro Cytotoxicity Tests.
W91-01712 5A

Automated Method for the Determination of Boron in Water by Flow-Injection Analysis with In-Line Preconcentration and Spectrophotometric Detection.
W91-01713 5A

Liquid Chromatographic Method with Fluorescence Detection for the Determination of Polycyclic Aromatic Hydrocarbons in Environmental Samples.
W91-01714 5A

Examination of the Range of Copper Complexing Ligands in Natural Waters Using a Combination of Cathodic Stripping Voltammetry and Computer Simulation.
W91-01715 5B

Speciation of Mercury Compounds in Waste Water by Microcolumn Liquid Chromatography Using a Preconcentration Column with Cold-Vapor Atomic Absorption Spectrometric Detection.
W91-01716 5A

Analysis of Target and Nontarget Pollutants in Aqueous Leachates from the Hazardous Waste Site in Stringfellow, California, Via Ion Chromatography-Particle Beam and Inductively Coupled Plasma Mass Spectrometry.
W91-01728 5A

Isolation and Characterization of Hepatotoxic Microcystin Homologs from the Filamentous Freshwater Cyanobacterium Nostoc sp. Strain 152.
W91-01761 2H

Failure of a Diagnostic Monoclonal Immunofluorescent Reagent to Detect Legionella pneumophila in Environmental Samples.
W91-01764 5A

Improved Detection of Acid Mine Water Stressed Coliform Bacteria on Media Containing Catalase and Sodium Pyruvate.
W91-01770 5A

Indicators of Chemical Pollution from Septic Systems.
W91-01785 5A

Evaluation of Detention Basin Performance in the Piedmont Region of North Carolina.
W91-01824 5G

Tentative Identification of Organic Compounds at the Westside Wastewater Treatment Plant (High Point, NC) and Implications for Aquatic Toxicity.
W91-01826 5D

Polyclonal and Monoclonal Enzyme Immunoassays for Picloram Detection in Water, Soil, Plants, and Urine.
W91-01912 5A

Broad-Range Methods for Determination of Pollutants in Wastewater.
W91-01914 5A

Determination of Volatile Organics in Drinking Water with USEPA Method 524.2 and the Ion Trap Detector.
W91-01915 5F

Supercritical Fluid Extraction and Its Application to Environmental Analysis.
W91-01916 5A

Rapid Method for the Simultaneous Analysis of Chlorpyrifos, Isofenphos, Carbaryl, Iprodione, and Triadimefon in Groundwater by Solid-Phase Extraction.
W91-01917 5A

Reversed-Phase Liquid Chromatographic Column Switching for the Trace-Level Determination of Polar Compounds. Application to Chloroallyl Alcohol in Ground Water.
W91-01918 5A

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

Gas Chromatography in Environmental Analysis: Aims and Challenges.
W91-01954 5A

Trace Gas Analysis Using Thermoanalytical Methods.
W91-01955 5A

GC-FTIRS: Applications in Organic Trace Analysis.
W91-01956 5A

Determination of Ortho-and Pyrophosphates in Waters by Extraction Chromatography and Flow-Injection Analysis.
W91-01962 5A

Effects of Sample Preparation on Measured Concentrations of Eight Elements in Edible Tissues of Fish from Streams Contaminated by Lead Mining.
W91-01968 5A

Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

Pollution of Street Run-off by Traffic and Local Conditions.
W91-01994 5B

Influence of Complexing Agents and Surfactants on Metal Speciation Analysis in Road Runoff.
W91-01999 5A

Application of Multivariate Analysis for Characterization of Organic Compounds from Urban Runoff.
W91-02004 5A

Multiresidue Method by High Performance Liquid Chromatography-based Fractionation and Gas Chromatographic Determination of Trace Levels of Pesticides in Air and Water.
W91-02038 5A

POLLUTION INDEX
Water Quality Index for Use in the Operational Management of River Water Quality in Europe.
W91-01215 5G

POLLUTION LOAD
Poison Runoff: New Answers to a Pervasive Problem.
W91-01623 5G

Decreasing Chloride Trends Observed at Lake Erie Municipal Water Intakes.
W91-01793 5G

LIBRARY U. OF L. CHICAGO-CIRCLE

Experimental Use of Dialysis Chamber Arrays to Study P-Fluxes in the Bay of Quinte, 1987.
W91-01796 2H

Inorganic Contaminants in Suspended Solids from Hamilton Harbour.
W91-01798 5B

Chemical Threat to the Environment in Poland.
W91-01887 5B

POLYCHAETES
Equilibrium Partitioning and Bioaccumulation of Sediment-Associated Contaminants by Infaunal Organisms.
W91-01267 5B

POLYCHLORINATED BIPHENYLS
Yolk Retinoids (Vitamin A) in Eggs of the Herring Gull and Correlations with Polychlorinated Dibenzo-p-dioxins and Dibenzofurans.
W91-01264 5C

Simultaneous Dual Column, Dual-Detector Gas Chromatographic Determination of Chlorinated Pesticides and Polychlorinated Biphenyls in Environmental Samples.
W91-01281 5A

Polychlorinated Biphenyls in Housatonic River Sediments in Massachusetts and Connecticut, USA: Determination, Distribution, and Transport.
W91-01328 5B

Effects of Sublethal Exposure to Chlorine on the Uptake of Polychlorinated Biphenyl Congeners by Rainbow Trout, Salmo gairdneri (Richardson).
W91-01367 5C

Time Trend of PCB Concentrations in Surface Sediments from a Hypertrophic, Macroalgae Populated Area of the Lagoon of Venice.
W91-01448 5B

Formation of PCDDs and PCDFs by the Chlorination of Water.
W91-01725 5F

Polychlorinated Dibenzofuran (PCDF) and Dibenzo-P-Dioxin (PCDD) Levels in Organisms and Sediments from the Frierfjord, Southern Norway.
W91-01726 5B

Effects of Organic Substrates on Dechlorination of Aroclor 1242 in Anaerobic Sediments.
W91-01758 5B

Morphological Deformities in Chironomidae(Diptera) Larvae from the Lac St. Louis and Laprairie Basins of the St. Lawrence River.
W91-01790 5C

Modeling the Fate and Transport of Organic Contaminants in Lake St. Clair.
W91-01792 5B

Relationship Between Chlorinated Hydrocarbons and Organic Carbon in Sediment and Porewater.
W91-01795 5B

Spatial and Seasonal Differences in the PCB Content of the Mussel Mytilus edulis.
W91-01819 5B

Presence of Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans in Fish-Eating Birds and Fish from the Netherlands.
W91-01966 5B

Geographic Variation of Chlorinated Hydrocarbons in Burbot (Lota lota) from Remote Lakes and Rivers in Canada.
W91-02033 5B

Comparative Toxicokinetics of 2,2'-Dichlorobiphenyls and 4,4'-Dichlorobiphenyls in the Pond Snail Lymnaea stagnalis.
W91-02036 5C

POLYCYCLIC AROMATIC HYDROCARBONS
Polycyclic Aromatic Hydrocarbon Emissions from the Combustion of Crude Oil on Water.
W91-01066 5B

Geochronology for Polycyclic Aromatic Hydrocarbon Contamination in Sediments of the Saguenay Fjord.
W91-01183 5B

Hydrolysis of Chlorostilbene Oxide: II. Modeling of Hydrolysis in Aquifer Samples and in Sediment-Water Systems.
W91-01256 5B

Yolk Retinoids (Vitamin A) in Eggs of the Herring Gull and Correlations with Polychlorinated Dibenzo-p-dioxins and Dibenzofurans.
W91-01264 5C

Toxicity of Fluoranthene in Sediment to Marine Amphipods: A Test of the Equilibrium Partitioning Approach to Sediment Quality Criteria.
W91-01265 5C

Characterization of Genotoxic Components in Sediments by Mass Spectrometric Techniques Combined with Salmonella/Microsome Test.
W91-01686 5A

Liquid Chromatographic Method with Fluorescence Detection for the Determination of Polycyclic Aromatic Hydrocarbons in Environmental Samples.
W91-01714 5A

Polynuclear Aromatic Hydrocarbon (PAH) Content of Archived Sewage Sludges.
W91-01737 5A

Risk Assessment of Drinking Water in a Reservoir Contaminated by PAHs Originated from Road Traffic.
W91-01991 5C

Effects of XAD-8 Fractions of Dissolved Organic Carbon on the Sorption and Bioavailability of Organic Micropollutants.
W91-02034 5B

PONDING
Depressional Storage for Markov-Gaussian Surfaces.
W91-01539 2J

PONDS
Nutrient Dynamics in a Floating Mat and Pond System with Special Reference to Its Vegetation.
W91-01126 2H

Spirogyra Species and Accompanying Algae from Pools and Ditches in The Netherlands.
W91-01333 5C

Spatial and Temporal Dispersion Patterns of Golden Perch, Macquaria ambigua, Larvae in an Artificial Floodplain Environment.
W91-01957 2H

Rapid Dissipation of Glyphosate in Small Forest Ponds.
W91-02018 5B

POPLAR TREES
Physiological Response of Yellow-Poplar Seedlings to Simulated Acid Rain, Ozone Fumigation, and Drought.
W91-01068 5C

POPULATION DENSITY
Seasonal Variations of Population Density and Activity of Sulfate-Reducing Bacteria in Offshore and Reed Sediments of a Hypertrophic Freshwater Lake.
W91-01072 2H

POPULATION DYNAMICS
Mangrove Ecology, Aquatic Primary Productivity, and Fish Community Dynamics in the Teacapan-Agua Brava Lagoon-Estuarine System (Mexican Pacific).
W91-01137 2F

Role of Nutrition in Regulating the Population Dynamics of Opportunistic, Surface Deposit Feeders in a Mesohaline Community.
W91-01145 2L

Modelling Black Fly Production Dynamics in Blackwater Streams.
W91-01346 2I

Phytoplankton Dynamics in Three Rocky Mountain Lakes, Colorado, U.S.A.
W91-01368 5

Climate, Population Viability, and the Zoogeography of Temperate Fishes.
W91-01400 2

Delayed Development of Bacterioplankton with Respect to Phytoplankton: A Clue for Understanding Their Trophic Relationships.
W91-01609 2

Modelling Seasonal Changes of Epilimnetic Bacteria on the Basis of Phyto- and Zooplankton Dynamics.
W91-01612 2

Dynamics of Pelagic Ciliates in Eutrophic Estuarine Waters: Importance of Functional Groups among Ciliates and Responses to Bacterial and Phytoplankton Production.
W91-01613

Study of Aquatic Community Dynamics in Karstic System by the Use of Artificial Substrates.
W91-01766

Changes in Sublittoral Zoobenthos in the German Bight with Regard to Eutrophication
W91-01940

Change of Water Quality and Composition of Plankton in the Pond of Reclaimed Site.
W91-01944

POPULATION EXPOSURE
Appraisal of the Potential Health Impacts of Sewage Disposal to UK Coastal Waters.
W91-01278

Simple Method for Estimating Dermal Absorption of Chemicals in Water.
W91-01731

Population Exposure to Chlorophenols, Dibenzo-p-Dioxins and Dibenzofurans After a Prolonged Ground Water Pollution by Chlorophenols.
W91-01734

PORE-WATER SAMPLERS
Simple Pore-Water Sampler for Coarse, Sandy Sediments of Low Porosity.
W91-01147

POROSITY
Geotextiles as Sealing Liners for Earthen Manure Reservoirs: Part 1, Geotextile Porosity
W91-01700

POROUS MEDIA
Mass Arrival of Sorptive Solute in Heterogeneous Porous Media.
W91-01521

Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 1. Experimental Investigation.
W91-01531 2F

Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 2. Permeability.
W91-01532 2F

Biofilm Growth and the Related Changes in the Physical Properties of a Porous Medium. 3. Dispersivity and Model Verification.
W91-01533 2F

Substrate and Biomass Transport in a Porous Medium.
W91-01534 2F

Approximate Solutions for Cation Transport During Unsteady, Unsaturated Soil Water Flow.
W91-01535 2G

PORTLAND CEMENTS
Immobilization Mechanisms in Solidification/Stabilization of Cd and Pb Salts Using Portland Cement Fixing Agents.
W91-01182 5G

PORTUGAL
Wastes From Animal Breeding: Water Quality Standards in an Integrated Perspective of Treatment and Valorization for Portugal and Southern Europe.
W91-01248 5D

POTABLE WATER
Ultraviolet Disinfection of Potable Water.
W91-01179 5F

Contamination of Potable Water by Corrosion of Tin-Lead Soldered Joints.
W91-01222 5B

Comprehensive Health Effects Testing Program for Denver's Potable Water Reuse Demonstration Project.
W91-01920 5D

Surface Water Discharge of Reverse Osmosis Concentrates.
W91-01979 5E

POTASSIUM
Relations Between Acid Rain and Vesicular-Arbuscular Mycorrhiza.
W91-01410 5C

POTASSIUM PERMANGANATE
Inactivation of Legionella pneumophila by Potassium Permanganate.
W91-01640 5F

POTENTIAL WATER SUPPLY
Hydrology of the Powder River Alluvium Between Sussex, Wyoming, and Moorhead, Montana.
W91-01852 2F

POTOMAC RIVER
Effect of Submersed Aquatic Vegetation on Phytoplankton and Water Quality in the Tidal Freshwater Potomac River.
W91-01743 2H

POWDER RIVER BASIN
Invertebrate Communities of Small Streams in Northeastern Wyoming.
W91-01850 2H

Hydrology of the Powder River Alluvium Between Sussex, Wyoming, and Moorhead, Montana.
W91-01852 2F

POYANG HU (LAKE)
Water Body Evaporation Experiment of Poyang lake (in Chinese).
W91-01576 2H

PRAIRIES
Relationship Between Canadian Prairie Dry and Wet Months and Circulation Anomalies in the Mid-Troposphere.
W91-01429 2B

PRECAMBRIAN SHIELD
Epiphytic Zoobenthos Density and Biomass within Low Alkalinity, Oligotrophic Lakes on the Canadian Shield.
W91-01338 5C

PRECAMBRIAN SHIELD LAKES
Cadmium Concentrations of Crustacean Zooplankton of Acidified and Nonacidified Canadian Shield Lakes.
W91-01062 5B

PRECIPITATION
Precipitation Nutrient Inputs in Semiarid Environments.
W91-01030 2B

Prediction of Phosphate Coprecipitation with Calcite in Freshwaters.
W91-01423 2H

Relationship Between Canadian Prairie Dry and Wet Months and Circulation Anomalies in the Mid-Troposphere.
W91-01429 2B

Radar Observations of Precipitation Production in Thunderstorms.
W91-01430 2B

Precipitation and Environmental Conditions during Accretion in Canadian East Coast Winter Storms.
W91-01487 2B

Aircraft-based Radiometric Imaging of Tropospheric Temperature and Precipitation Using the 118.75-GHz Oxygen Resonance.
W91-01488 7B

Fourier Domain Shape Analysis Methods: A Brief Review and an Illustrative Application to Rainfall Area Evolution.
W91-01537 2B

Record-Breaking Rise of Great Salt Lake in 1981-1986 Related to Anomalous Mid-Tropaspheric Wind Patterns.
W91-01580 2H

Changeable Weather-A Chaotic Phenomenon Triggered off by Mesoscale Precipitation-Eddies (Wetterlaunen als Chaotische Meso-Skalige Strukturen).
W91-01582 2B

Extreme, Singular and Coherent Precipitation in the Catchment Basin of the Upper Inn River (Extreme, Singulaere und Kohaerente Niedersclaege im Gebiet des Aplinen Inn).
W91-01583 2B

Use of Polarization to Characterize Precipitation and Discriminate Large Hail.
W91-01656 2B

Entrainment and Mixing Processes as Related to Droplet Growth in Warm Midlatitude and Tropical Clouds.
W91-01657 2B

Precipitation Production in a Large Montana Hailstorm: Airflow and Particle Growth Trajectories.
W91-01658 2B

Use of Daily Values of Surface Parameters at Durban and Cape Town to Determine the Precipitable Water Content of the Atmosphere.
W91-01660 2B

Rainwater Acidity at Jabiru, Australia, in the Wet Season of 1983/84.
W91-01818 5B

Chemical Composition of Bulk Precipitation Across the Mountains of Snowdonia, U.K.
W91-01820 2B

PRECIPITATION GAGES
Design for an Occult Precipitation Collector.
W91-01291 7B

PRECIPITATION SCAVENGING
Rain Scavenging of Tephra Aerosols from Mount St. Helens 1980 Eruptions.
W91-01468 2B

PREDATION
Periodic Bacterivore Activity Balances Bacterial Growth in the Marine Environment.
W91-01037 2L

Refuge Availability: A Key to Understanding the Summer Disappearance of Daphnia.
W91-01342 2H

Stonefly Predation Along a Hydraulic Gradient: A Field Test of the Harsh--Benign Hypothesis.

PRESSURE SEWERS
Pressure Sewers Design Considerations and Anticipated Maintenance.
W91-01964 5D

PRETREATMENT OF WASTEWATER
Industrial Pretreatment: Cooperation--To a Point...
W91-01565 5D

PRIMARY PRODUCTION
Incorporation of Thymidine, Adenine and Leucine into Natural Bacterial Assemblages.
W91-01931 2L

Primary Production and Nitrogen Assimilation in the North Sea During July 1987.
W91-01938 2L

Changes in Spatial Distribution of Primary Production, Photosynthetic Pigments and Phytoplankton Species Composition During Two Surveys in the German Bight.
W91-01939 2L

PRIMARY PRODUCTIVITY
Cultural Eutrophication of West Point Lake--A 10-Year Study.
W91-01354 5C

Fate of Phytoplankton Primary Production: Losses in Relation to Bacterial Metabolism in a Eutrophic Shallow Lake.
W91-01593 2K

Distribution and Primary Productivity of the Epizoic Macroalga Boldia erythrosiphon (Rhodophyta) in a Small Alabama Stream.
W91-01805 2H

Phosphate Limitation in Estuarine and Coastal Waters of China.
W91-01923 2L

Pelagic Metabolism in Eutrophic Waters During a Late Summer Period.
W91-01929 2L

PRIORITY POLLUTANTS
Nonpriority Analysis of the Wastewater Streams of Four Dye Manufacturing Facilities.
W91-01172 5A

PROBABILITY DISTRIBUTION
Statistical Characteristics of Some Estimators of Sediment and Nutrient Loadings.
W91-01538 2J

LIBRARY U. OF I. URBANA-CHAMPAIGN

PRODUCTIVITY
Phytoplankton Biomass, Production and Growth Limitations on the Huanghe (Yellow River) Continental Shelf.
W91-01058 2L

Modelling Black Fly Production Dynamics in Blackwater Streams.
W91-01346 2H

Geographical Distribution of Contaminants and Productivity Measures of Herring Gulls in the Great Lakes: Lake Erie and Connecting Channels 1978/79.
W91-01454 5B

Measuring the Productivity of Construction Maintenance Operations.
W91-01749 5F

PROJECT PLANNING
Balance of Representation in Water Planning: An Assessment of Experience from North Carolina.
W91-01059 6A

Multidimensional Simulation Applied to Water Resources Management.
W91-01508 6B

U. S. Federal Highway Administration's Receiving Water Impact Methodology.
W91-02000 5G

PROTEINS
Improved Assessment of Bacterial Production: Combined Measurements of Protein Synthesis via Leucine and Cell Multiplication via Thymidine Incorporation.
W91-01605 2H

Conversion of Fat into Yeast Biomass in Protein-Containing Waste-Water.
W91-01717 5D

New Gene Sources for Development of Agronomic Plants with Tolerance to Drought and Other Abiotic Stresses.
W91-01859 3B

PROTOZOA
Dynamics of Pelagic Ciliates in Eutrophic Estuarine Waters: Importance of Functional Groups among Ciliates and Responses to Bacterial and Phytoplankton Production.
W91-01613 2L

Uptake of Bacteria-Sized Fluorescent Particles by Natural Protozoan Assemblage in a Reservoir.
W91-01617 2H

Planktonic Protozoa in Lakes Huron and Michigan: Seasonal Abundance and Composition of Ciliates and Dinoflagellates.
W91-01799 2H

Rates of Protozoan Bacterivory in Three Habitats of a Southeastern Blackwater River.
W91-01809 2H

PROTOZOANS
Fate of Entamoeba histolytica During Sewage Treatment Using Anaerobic Digesters.
W91-01241 5D

PSEUDOMONAS
Fate of Genetically Engineered Microorganisms in Freshwater.
W91-01240 5B

PUBLIC HEALTH
Outbreak of Pontiac Fever Due to Legionella anisa.
W91-01032 5C

Aldicarb Food Poisonings in California, 1985-1988: Toxicity Estimates for Humans.
W91-01052 5C

Plasma Chloroform Concentrations in Swimmers Using Indoor Swimming Pools.
W91-01053 5B

Recovery of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone from Water Samples on XAD Resins and the Effect of Chlorine on Its Mutagenicity.
W91-01181 5A

Contamination of Potable Water by Corrosion of Tin-Lead Soldered Joints.

PUMPED STORAGE
Possibilities of Constructing Hydroelectric Stations: Pumped Storage Stations in Armenia.
W91-01439 8C

PUMPING
Reconnaissance-Level Alternative Optimal Ground-Water Use Strategies.
W91-01557 6D

PUMPING HEAD
Interbed Storage Changes and Compaction in Models of Regional Groundwater Flow.
W91-01513 2F

PUMPING PLANTS
Upgrading Antique Sewers.
W91-01484 5B

PUMPING TEST
Predicting Well Drawdown During Prolonged Pumping.
W91-01682 4B

PUMPING TESTS
Program to Calculate Hydraulic Conductivity Using Slug Test Data.
W91-01305 7C

Dimensionless Straight-Type Lines for Aquifer Tests.
W91-01497 2F

PUMPS
Use of Pump-Out Facilities by Recreational Boaters in Maryland.
W91-01904 5E

PYRETHRINS
Acute Toxicities of Five Synthetic Pyrethroid Insecticides to Daphnia magna and Ceriodaphnia dubia.
W91-01263 5C

QUALITY CONTROL
Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Assessment of the Ontario Ministry of the Environment Protocols for Conducting Daphnia magna Acute Lethal Toxicity Tests with Pulp and Paper Mill Effluents.
W91-01266 5C

QUANTITATIVE ANALYSIS
Structure-Toxicity Relationships for Selected Weak Acid Respiratory Uncouplers.
W91-01364 5C

QUEBEC
Dissolved Organic Carbon Concentrations and Fluxes Along the Moisie River, Quebec.
W91-01341 2K

Associations of Aquatic Insects (Ephemeroptera, Plecoptera, and Trichoptera) in a Network of Subarctic Lakes and Streams in Quebec.
W91-01349 2H

Methane Emissions from Fen, Bog and Swamp Peatlands in Quebec.
W91-01719 5B

QUEENSLAND
Queensland Rainforest and Wetlands Conflict: Australia's External Affairs Power--Domestic Control and International Conservation.
W91-01104 6E

RADAR
Radar Observations of Precipitation Production in Thunderstorms.
W91-01430 2B

Use of Polarization to Characterize Precipitation and Discriminate Large Hail.
W91-01656 2B

Precipitation Production in a Large Montana Hailstorm: Airflow and Particle Growth Trajectories.
W91-01658 2B

RADIATION
Relevance of the Microphysical and Radiative Properties of Cirrus Clouds to Climate and Climatic Feedback.
W91-01445 2B

RADIOACTIVE DATING
Calculation and Uncertainty Analysis of Pb210 Dates for PIRLA Project Lake Sediment Cores.
W91-01501 2H

RADIOACTIVE WASTE DISPOSAL
Basic Model of Water- and Gas-flow through Smectite Clay Buffers.
W91-01458 2G

Hillslope Erosion at the Maxey Flats Radioactive Waste Disposal Site, Northeastern Kentucky.
W91-01831 2J

RADIOACTIVE WASTES
Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-01833 5B

Mutagenic Activity of Surface Waters Adjacent to a Nuclear Fuel Processing Facility.
W91-01972 5C

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

Toxicological Examination of Whitefish (Coregonus clupeaformis) and Northern Pike (Esox lucius) Exposed to Uranium Mine Tailings.
W91-02037 5C

RADIOACTIVITY
Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-01833 5B

RADIOECOLOGY
Contamination of Bavarian Lakes After the Chernobyl Reactor Accident: A Two-Compartment Model Analysis.
W91-01185 5B

RADIOISOTOPES
Leaching of Radionuclides from Decaying Blueberry Leaves: Relative Rate Independent of Concentration.
W91-01018 5B

RADIOMETRY
Evaluation of Biologically Harmful Ultraviolet Radiation in Antarctica with a Biological Dosimeter Designed for Aquatic Environments.
W91-01138 7B

Algorithm for Retrieving Water Vapor Profiles in Clear and Cloudy Atmospheres from 183 GHz Radiometric Measurements: Simulation Studies.
W91-01474 7C

Aircraft-based Radiometric Imaging of Tropospheric Temperature and Precipitation Using the 118.75-GHz Oxygen Resonance.
W91-01488 7B

RADIONUCLIDES
Measurement and Interpretation of Low Levels of Dissolved Oxygen in Ground Water.
W91-01788 7B

RADON
Lognormal Distribution of Radon Concentration in Ground Water.
W91-01294 5B

RADON RADIOISOTOPES
Analysis of 228Ra and 226Ra in Public Water Supplies by a Gamma-Ray Spectrometer.
W91-01667 5A

RAIN
Use of Polarization to Characterize Precipitation and Discriminate Large Hail.
W91-01656 2B

Entrainment and Mixing Processes as Related to Droplet Growth in Warm Midlatitude and Tropical Clouds.
W91-01657 2B

RAIN FORESTS
Queensland Rainforest and Wetlands Conflict: Australia's External Affairs Power--Domestic Control and International Conservation.
W91-01104 6E

RAIN GAGES
Design for an Occult Precipitation Collector.
W91-01291 7B

RAINFALL
Rainfall Induced Soil Seal (C) A Dynamic Model with Kinetic Energy Instead of Cumulative Rainfall as Independent Variable.
W91-01089 2G

Changes in West African Savanna Agriculture in Response to Growing Population and Continuing Low Rainfall.
W91-01683 6D

Rainwater Acidity at Jabiru, Australia, in the Wet Season of 1983/84.
W91-01818 5B

Long Flume Study of the Dynamic Factors Affecting the Resistance of a Loamy Soil to Concentrated Flow Erosion.
W91-01878 2J

RAINFALL AREA
Fourier Domain Shape Analysis Methods: A Brief Review and an Illustrative Application to Rainfall Area Evolution.
W91-01537 2B

RAINFALL DISTRIBUTION
Time Scales and Variability of Area-Averaged Tropical Oceanic Rainfall.
W91-01446 2B

Spatial Variability of Annual Precipitation and ENSO Events in Western Peru.
W91-01463 2B

Regionalization and Spatial Estimation of Ethiopian Mean Annual Rainfall.
W91-01466 2B

Temporal and Spatial Characteristics of Annual Precipitation over the Balkans in the Twentieth Century.
W91-01467 2B

LIBRARY U. OF I. WATER SURVEY

Monitoring of Rainfall in Relation to the Control of Migrant Pests.
W91-01561 2B

RAINFALL IMPACT
Laboratory Experiments on Crust Development and Rainsplash Erosion of Loess Soils, China.
W91-01087 2J

Rainfall Induced Soil Seal: (A) A Critical Review of Observations and Models.
W91-01872 2G

Rainfall Induced Soil Seal: (B) Application of a New Model to Saturated Soils.
W91-01873 2G

RAINFALL-RUNOFF RELATIONSHIPS
Application of a Simple Lumped River Flow Forecasting Model to Hillslope Soil Water Storage Estimation.
W91-01086 2G

Mixing in Overland Flow During Rainfall.
W91-01153 5B

SWMM-4.
W91-01191 4C

Urban Runoff Modeling for Administrative Purposes.
W91-01193 4C

Distributed Rainfall-Runoff Modeling Based on Digital Map Database.
W91-01203 7C

PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

Hyetograph Compositing Effects on Urban Runoff Modelling.
W91-01206 7C

Flood Hydrograph for Ungaged Watershed.
W91-01207 7C

Unit-Hydrograph Procedures for Arid Lands.
W91-01208 7C

Development, Calibration and Field Testing of a Soil Loss and a Runoff Model Derived from a Small-Scale Physical Simulation of the Erosion Environment on Arable Land in Zimbabwe.
W91-01478 2J

Problems in Determining the Return of a Watershed to Pretreatment Conditions: Techniques Applied to a Study at Caspar Creek, California.
W91-01523 4C

Physically Based Model for Predicting Solute Transfer From Soil Solution to Rainfall-Induced Runoff Water.
W91-01527 5B

Depressional Storage for Markov-Gaussian Surfaces.
W91-01539 2J

Hydraulic Shock Loadings of Wastewater Treatment System to Urban Rainfall-Runoff (Effets Chocs Hydrauliques des Eaux Usees de Ruissellemaent Pluvial Urbain sur un Systeme de Traitement des Eaux).
W91-01638 5D

Kinematic Cascades: Derivation of a Generalized Shock Formation Criterion.
W91-01673 8B

Peak-Flow Characteristics of Small Urban Drainage Along the Wasatch Front, Utah.
W91-01834 4C

RAINSTORMS
Radar Observations of Precipitation Production in Thunderstorms.
W91-01430 2B

RAPESEED
Evapotranspiration, Water Use Efficiency, Moisture Extraction Pattern and Plant Water Relations of Rape (Brassica campestris) Genotypes in Relation to Root Development Under Varying Irrigation Schedules.
W91-01114 2D

RECHARGE BASINS
Optimal Artificial Recharge in Intermittent Multibasin System.
W91-01554 4B

RECLAIMED WATER
Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation: Part I. Evaluation of the Physical Properties of Highly Concentrated Brines.
W91-01757 3A

Reclaiming Reverse Osmosis Blowdown with Electrodialysis Reversal.
W91-01984 5D

RECREATION
Single-Stage and Two-Stage Decision Modeling of the Recreational Demand for Water.
W91-01699 6D

RECREATION DEMAND
Modeling to Generate Recreational Alternatives.
W91-01553 6D

RED TIDE
Recruitment Failure of the Bay Scallop, Argopecten irradians concentricus, During the First Red Tide, Ptychodiscus brevis, Outbreak Recorded in North Carolina.
W91-01908 5C

REEDS
Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

REGIONAL ACID DEPOSITION MODEL
Analysis of RADM Gas Concentration Predictions Using OSCAR and NEROS Monitoring Data.
W91-01285 5B

REGIONAL DEVELOPMENT
Environmental Evaluation Procedure for Coastal Developments in South Africa.
W91-01122 6B

REGIONAL PLANNING
Regional Overview of Water Quality Monitoring.
W91-01680 6B

REGRESSION ANALYSIS
Real-time Multipurpose Reservoir Operation: A Case Study.
W91-01464 4A

Mean Square Error of Regression-Based Constituent Transport Estimates.
W91-01522 5B

Use of Daily Values of Surface Parameters at Durban and Cape Town to Determine the Precipitable Water Content of the Atmosphere.
W91-01660 2B

REGULATED FLOW
Suspended Sediment and Bed Load Problems of the Upper Rhine.
W91-01871 4D

REGULATIONS
Enforcement of Federal Underground Storage Tank Regulations.
W91-01103 5G

Water Quality Index for Use in the Operational Management of River Water Quality in Europe.
W91-01215 5G

Preview Analysis of National Sludge Survey.
W91-01661 5E

Proposed EPA Sludge Disposal Regulations: Project Purgatory.
W91-01676 5E

Environmental Testing-Issues and Directions.
W91-01913 5G

Historic Development of the Concentrate Regulations.
W91-01977 5G

Current Regulatory Concerns Related to the Disposal of RO Concentrates in Florida.
W91-01978 5G

REHABILITATION
Dam Renovation: From Investigation to Repair.
W91-01748 8F

City Tackles Major Sanitary Sewer Rehabilitation with New Process.
W91-01755 5D

REMOTE SENSING
Temporal Variability of Remotely Sensed Suspended Sediment and Sea Surface Temperature Patterns in Mobile Bay, Alabama.
W91-01131 2L

Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Algorithm for Retrieving Water Vapor Profiles in Clear and Cloudy Atmospheres from 183 GHz Radiometric Measurements: Simulation Studies.
W91-01474 7C

Aircraft-based Radiometric Imaging of Tropospheric Temperature and Precipitation Using the 118.75-GHz Oxygen Resonance.
W91-01488 7B

RENAL DIALYSIS
Micropollutants in Water Used for Renal Dialysis: An International Perspective.

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

ROOT DEVELOPMENT
Evapotranspiration, Water Use Efficiency, Moisture Extraction Pattern and Plant Water Relations of Rape (Brassica campestris) Genotypes in Relation to Root Development Under Varying Irrigation Schedules.
W91-01114 2D

ROOTS
Decomposition of Roots in a Seasonally Flooded Swamp Ecosystem.
W91-01331 2H

ROTAVIRUSES
Rotavirus as a Viral Indicator in Shellfish.
W91-01243 5A

ROTENONE
Benthic Community Structure and the Effect of Rotenone Piscicide on Invertebrate Drift and Standing Stocks in Two Papua New Guinea Streams.
W91-01767 2H

ROUGHNESS COEFFICIENT
Estimation of Manning's Roughness Coefficient for Basin and Border Irrigation.
W91-01406 3F

RUBBER
Start-Up in Anaerobic Treatment of Natural-Rubber Effluent.
W91-01056 5D

RUBIDIUM
Study on Geochemistry and Geochemical Classification of Elements B, F, Rb and Sr in Yellow Sea (Huang Hai) Sediments.
W91-01566 2J

RUNOFF
Humus Form Development and Hillslope Runoff, and the Effect of Fire and Management, Under Mediterranean Forest in NE-Spain.
W91-01079 2G

Spatial Scale Dependence of Sediment Dynamics in a Semi-Arid Badland Drainage Basin.
W91-01085 2J

Influence of Hudson Bay Runoff and Ice-Melt on the Salinity of the Inner Newfoundland Shelf.
W91-01432 2E

Poison Runoff: New Answers to a Pervasive Problem.
W91-01623 5G

Rainfall Induced Soil Seal: (A) A Critical Review of Observations and Models.
W91-01872 2G

Long Flume Study of the Dynamic Factors Affecting the Resistance of a Loamy Soil to Concentrated Flow Erosion.
W91-01878 2J

RUNOFF FORECASTING
Development, Calibration and Field Testing of a Soil Loss and a Runoff Model Derived from a Small-Scale Physical Simulation of the Erosion Environment on Arable Land in Zimbabwe.
W91-01478 2J

RUNOFF RATES
Long Flume Study of the Dynamic Factors Affecting the Resistance of a Loamy Soil to Concentrated Flow Erosion.
W91-01878 2J

RURAL AREAS
Strategy for Cost Recovery in the Rural Water Sector: A Case Study of Nsukka District, Anambra State, Nigeria.
W91-01510 6C

SAGO PONDWEED
Influence of Organic Sediment Amendments on Growth and Tuber Production by Potamogeton pectinatus L.
W91-01740 2I

Mosquito Control in Wastewater: A Controlled and Quantitative Comparison of Pupfish (Cyprinodon nevadensis amargosae), Mosquitofish (Gambusia affinis) and Guppies (Poecilia reticulata) in Sago Pondweed Marshes.
W91-01988 5D

SALINAS RIVER
Water-Resources Data-Network Evaluation for Monterey County, California, Phase 3: Northern Salinas River Drainage Basin.
W91-01836 7A

SALINE-FRESHWATER INTERFACES
Computed and Observed Currents, Elevations, and Salinity in a Branching Estuary.
W91-01129 2L

Salinity Stratification in a River-Dominated Estuary.
W91-01130 2L

Barotropic, Subtidal Exchange Between Calcasieu Lake and the Gulf of Mexico.
W91-01901 2H

SALINE LAKES
Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Seasonal and Long-Term Trends in Truckee River Nutrient Concentrations and Truckee River Nutrient Concentrations and Loadings to Pyramid Lake, Nevada: A Terminal Saline Lake.
W91-01425 5B

Soda Lakes on Inner Mongolia Plateau, China.
W91-01574 2H

ALINE SOILS
Differential Response of Wheat and Barley Genotypes to Substrate-Induced Salinity Under North Indian Conditions.
W91-01113 3C

Dynamics of Root and Shoot Growth of Barley Under Various Levels of Salinity and Water Stress.
W91-01409 3F

Causes of Soil Salinization: 2. A Basin in East-Central Alberta, Canada.
W91-01783 2G

ALINE WATER
Growth and Value of Chlorella salina Grown on Highly Saline Sewage Effluent.
W91-01708 5D

ALINE WATER INTRUSION
Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 1. Review of Theory and Verification.
W91-01524 2F

ALINE WATER IRRIGATION
Effects of Saline Water Irrigation on Growth and Mineral Distribution in Guar (Cyamopsis tetragonoloba (L.) Taub).
W91-01149 3C

ALINITY
Influence of Water Chemistry on Suspended Solids in Coal Mine Sedimentation Ponds.
W91-01013 5D

Longitudinal Dispersion Processes in the Upper Tamar Estuary.
W91-01127 2L

Computed and Observed Currents, Elevations, and Salinity in a Branching Estuary.
W91-01129 2L

Salinity Stratification in a River-Dominated Estuary.
W91-01130 2L

Effects of Salinity, Temperature, and Cadmium on Cadmium-binding Protein in the Grass Shrimp, Palaemonetes pugio.
W91-01309 5B

Effect of Hardness and Salinity on Survival of Striped Bass Larvae.
W91-01386 8I

Influence of Hudson Bay Runoff and Ice-Melt on the Salinity of the Inner Newfoundland Shelf.
W91-01432 2E

Soda Lakes on Inner Mongolia Plateau, China.
W91-01574 2H

Two-Dimensional Numerical Calculation of Residual Current and Salinity at the Changjiang River Estuary (in Chinese).
W91-01578 2L

Salinity Trends in Louisiana Estuaries.
W91-01902 2L

Growth of Submerged Macrophytes Under Experimental Salinity and Light Conditions.
W91-01907 2H

Irrigation with Membrane Plant Concentrate: Fort Myers Case Study.
W91-01981 3C

SALMON
Acute Toxicity of Boron, Molybdenum, and Selenium to Fry of Chinook Salmon and Coho Salmon.
W91-01313 5C

Hydroelectric Dams and the Decline of Chinook Salmon in the Columbia River Basin.
W91-01560 6G

Observations on Overwintering Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) Exposed to Bleached Kraft Mill Effluent in the Upper Fraser River, British Columbia.
W91-01724 5B

Abundance of Spawning Pacific Salmon in Two Lake Superior Streams, 1981-1987.
W91-01791 8I

Sublethal and Acute Toxicity of the Ethylene Glycol Butyl Ether Ester Formulation of Triclopyr to Juvenile Coho Salmon (Oncorhynchus kisutch).
W91-02039 5C

SALT BALANCE
Computed and Observed Currents, Elevations, and Salinity in a Branching Estuary.
W91-01129 2L

SALT MARSHES
Processes Governing Marsh Formation in a Rapidly Subsiding Coastal Environment.
W91-01088 2L

Bacterial Mediation in the Utilization of Carbon and Nitrogen from Detrital Complexes by Crassostrea virginica.
W91-01141 2L

Nitrogen Cycling in Louisiana Gulf Coast Brackish Marshes.
W91-01351 2L

Vegetation Dynamics in Impounded Marshes Along the Indian River Lagoon, Florida, USA.
W91-01636 4C

SALT STRESS
Differential Response of Wheat and Barley Genotypes to Substrate-Induced Salinity Under North Indian Conditions.
W91-01113 3C

Effects of Saline Water Irrigation on Growth and Mineral Distribution in Guar (Cyamopsis tetragonoloba (L.) Taub).
W91-01149 3C

SALT TOLERANCE
Differential Response of Wheat and Barley Genotypes to Substrate-Induced Salinity Under North Indian Conditions.
W91-01113 3C

SAMPLE PREPARATION
Effects of Sample Preparation on Measured Concentrations of Eight Elements in Edible Tissues of Fish from Streams Contaminated by Lead Mining.
W91-01968 5A

Characterization of Compost with Respect to Its Content of Heavy Metals, Part I: Sample Digestion and ICP-AES Analysis.
W91-01986 5E

SAMPLE PRESERVATION
Influence of Complexing Agents and Surfactants on Metal Speciation Analysis in Road Runoff.
W91-01999 5A

SAMPLERS
Application of a Hollow-Fiber, Tangential-Flow Device for Sampling Suspended Bacteria and Particles from Natural Waters.
W91-01031 5A

Simple Pore-Water Sampler for Coarse, Sandy Sediments of Low Porosity.
W91-01147 7B

Benthic Macrophyte Community Core Sampler.
W91-01747 7B

SAMPLING
Variations in Suspended Sediment and Associated Trace Element Concentrations in Selected Riverine Cross Sections.
W91-01061 2J

Shore-Based Microbiological Sampling of Recreational/Bathing Waters: Possible Problems and Solutions.
W91-01234 5A

Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Design for an Occult Precipitation Collector.
W91-01291 7B

Evaluation of Designs of Periodic Count Surveys for the Estimation of Escapement at a Fishway.
W91-01384 7A

Mean Square Error of Regression-Based Constituent Transport Estimates.
W91-01522 5B

Studies on the Chemistry of Interstitial Water Taken from Defined Horizons in the Fine Sediments of Bivalve Habitats in Several Northern German Lowland Waters: I. Sampling Techniques.
W91-01768 2H

LIBRARY U. OF I. URBANA-CHAMPAIGN

SAMPLING

Sampling Strategies for Parameter Estimation in Groundwater Quality Management: Theory and Field Validation.
W91-01866 5A

Environmental Testing-Issues and Directions.
W91-01913 5G

Influence of Complexing Agents and Surfactants on Metal Speciation Analysis in Road Runoff.
W91-01999 5A

SAN FRANCISCO BAY
Episodic Changes in Lateral Transport and Phytoplankton Distribution in South San Francisco Bay.
W91-01045 2L

SAN FRANCISCO RIVER
Flood of October 1983 and History of Flooding Along the San Francisco River, Clifton, Arizona.
W91-01849 2E

SAN JOAQUIN VALLEY
Use of Solar Ponds in the Disposal of Desalting Concentrate.
W91-01982 5E

SAND
Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.
W91-01651 8D

Modelling of Sandwave Evolution Resulting from Suspended and Bed Load Transport of Sediment.
W91-01675 8B

SAND FILTERS
Virus Removal by Sand Filtration of Septic Tank Effluent.
W91-01156 5D

Performance of Lagoon Intermittent Sand Filter Systems.
W91-01177 5D

SAND FILTRATION
Virus Removal by Sand Filtration of Septic Tank Effluent.
W91-01156 5D

SANDY SOILS
Zinc in Poor Sandy Soils and Associated Groundwater. A Case Study.
W91-01450 5B

SATELLITE TECHNOLOGY
Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Monitoring of Rainfall in Relation to the Control of Migrant Pests.
W91-01561 2B

SATURATED FLOW
Groundwater: A Review of the 1989 Literature.
W91-01178 2F

Relation Between Saturated Conductivity and Capillary Retention Characteristics.
W91-01303 2F

SATURATED SOILS
Studies on the Decomposition of Lignocellulosic Carbon in a Flooded Ricefield Soil.
W91-01602 2H

Rainfall Induced Soil Seal: (B) Application of a New Model to Saturated Soils.
W91-01873 2G

SCALING
High Recovery Reverse Osmosis.
W91-01985 3A

SCALLOPS
Recruitment Failure of the Bay Scallop, Argopecten irradians concentricus, During the First Red Tide, Ptychodiscus brevis, Outbreak Recorded in North Carolina.
W91-01908 5C

Effect of Heavy Metals on Bay Scallops, Surf Clams, and Blue Mussels in Acute and Long-term Exposures.
W91-01973 5C

SCANDINAVIA
Ecological Mechanisms Important for the Biotic Changes in Acidified Lakes in Scandinavia.
W91-02015 5C

SCANDIUM
Accumulation of Scandium in the Shoots of Aquatic Bryophytes in Acid Water.
W91-01355 2H

SCHELDT ESTUARY
Winter Distribution of Nutrients in the Southern Bight of the North Sea (1961-1978) and in Estuaries of the Scheldt and the Rhine/Muese.
W91-01936 2L

SCOTLAND
Eutrophication: Assessment, Research and Management with Special Reference to Scotland's Freshwaters.
W91-01277 5C

Soil and Soil Solution Chemical Composition at Three Sites within the Loch Dee Catchment, SW Scotland.
W91-01480 2K

SCOUR
Flow Induced Pipe Vibration During Its Sagging Process.
W91-01670 8B

Scourhole Developments in Shallow Tailwater.
W91-01674 8B

SEA GRASSES
Tributyltin and Invertebrates of a Seagrass Ecosystem: Exposure and Response of Different Species.
W91-01625 5C

Effects of Tributyltin Within a Thalassia Seagrass Ecosystem.
W91-01906 5C

SEA ICE
Influence of Hudson Bay Runoff and Ice-Melt on the Salinity of the Inner Newfoundland Shelf.
W91-01432 2E

SEA LEVEL
Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

Response of Coastal Zone Management Programs to Sea Level Rise in the United States.
W91-01619 6B

SEA LEVEL RISE
Response of Coastal Zone Management Programs to Sea Level Rise in the United States.
W91-01619 6B

SEASONAL VARIATION
Seasonal Variations of Population Density and Activity of Sulfate-Reducing Bacteria in Offshore and Reed Sediments of a Hypertrophic Freshwater Lake.
W91-01072 2H

Site Sewage Disposal: The Importance of the Wet Season Water Table.
W91-01379 5E

Seasonal Variation of Thermophilic Campylobacters in Sewage Sludge.
W91-01655 5B

Interstitial Dissolved Organic Carbon in Sediments of a Southern Appalachian Headwater Stream.
W91-01804 2H

Distribution and Primary Productivity of the Epizoic Macroalga Boldia erythrosiphon (Rhodophyta) in a Small Alabama Stream.
W91-01805 2H

Spatial and Seasonal Differences in the PCB Content of the Mussel Mytilus edulis.
W91-01819 5B

Mercury, Cadmium and Lead in Eels and Roach: The Effects of Size, Season, and Locality on Metal Concentrations in Flesh and Liver.
W91-01821 5B

Mercury, Cadmium and Lead Concentrations in Five Species of Freshwater Fish from Eastern England.
W91-01822 5B

SECONDARY PRODUCTIVITY
Annual Stonefly (Plecoptera) Production in a Second Order Oklahoma Ozark Stream.
W91-01506 2H

Empirical Evidence for Differences Among Methods for Calculating Secondary Production.
W91-01808 7C

Rates of Protozoan Bacterivory in Three Habitats of a Southeastern Blackwater River.
W91-01809 2H

SECONDARY WASTEWATER TREATMENT
Giardia in Wastewater: Effect of Treatment.
W91-01173 5D

Performance of Four Full-Scale Nitrifying Wastewater Treatment Plants Incorporating Selectors.
W91-01174 5D

Chemostat Studies of a Mixed Culture Growing on Phenolics.
W91-01175 5D

Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

Expansion and Upgrading of the Chalfont-New Britain Township Joint Sewage Authority/Bucks County Water and Sewer Authority Wastewater Treatment Plant.
W91-01678 5D

Mosquito Control in Wastewater: A Controlled and Quantitative Comparison of Pupfish (Cyprinodon nevadensis amargosae), Mosquitofish (Gambusia affinis) and Guppies (Poecilia reticulata) in Sago Pondweed Marshes.
W91-01988 5D

SEDIMENT ANALYSIS
Pitfalls of Sequential Extractions.
W91-01428 2K

Measurement of CO2-Fixation in Sediments, Some Theoretical and Technical Aspects.
W91-01586 2

Trace Determination of Lower Volatile Fatty Acids in Sediments by Gas Chromatography with Chemically Bonded FFAP Columns.
W91-01919 5A

Heavy Metals in Sediments of the Yamuna River (A Tributary of the Ganges), India.
W91-02005 2K

EDIMENT CHEMISTRY
Variations in Sedimentary Carbon Remineralization Rates in the White Oak River Estuary, North Carolina.
W91-01040 2L

Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

Pitfalls of Sequential Extractions.
W91-01428 2K

Sequentially Extracted Metals in Adirondack Lake Sediment Cores.
W91-01500 2H

Existing Forms of Phosphorus in Sediment from Middle and Northern Taiwan Strait (in Chinese).
W91-01575 2L

Measurement of CO2-Fixation in Sediments: Some Theoretical and Technical Aspects.
W91-01586 2J

Measurement of Exoenzymatic Activity in Streambed Sediments Using Methylumbelliferyl-Substrates.
W91-01587 2J

Method of Measuring the Dehydrogenase Activity of Sediments.
W91-01588 2J

Denitrification and Nitrous Oxide in the North Sea.
W91-01935 5B

Partitioning of Lindane Between Sediment, Water and the Crustacean Metapenaeus macleayi.
W91-02042 5B

DIMENT CONTAMINATION
Geochronology for Polycyclic Aromatic Hydrocarbon Contamination in Sediments of the Saguenay Fjord.
W91-01183 5B

Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Toxicity of Fluoranthene in Sediment to Marine Amphipods: A Test of the Equilibrium Partitioning Approach to Sediment Quality Criteria.
W91-01265 5C

Equilibrium Partitioning and Bioaccumulation of Sediment-Associated Contaminants by Infaunal Organisms.
W91-01267 5B

Polychlorinated Biphenyls in Housatonic River Sediments in Massachusetts and Connecticut, USA: Determination, Distribution, and Transport.
W91-01328 5B

Characterization of Genotoxic Components in Sediments by Mass Spectrometric Techniques Combined with Salmonella/Microsome Test.
W91-01686 5A

Polychlorinated Dibenzofuran (PCDF) and Dibenzo-P-Dioxin (PCDD) Levels in Organisms and Sediments from the Frierfjord, Southern Norway.
W91-01726 5B

Butyltins in Sediments and Bivalves from U.S. Coastal Areas.
W91-01735 5B

Experimental Use of Dialysis Chamber Arrays to Study P-Fluxes in the Bay of Quinte, 1987.
W91-01796 2H

Distribution of Heavy Metals in Gove Harbour, Northern Territory, Australia.
W91-01813 5B

Volatilization of Selenium from Agricultural Evaporation Pond Sediments.
W91-01814 5G

NOAA's Status and Trends Mussel Watch Program: Chlorinated Pesticides and PCBs in Oysters (Crassostrea virginica) and Sediments from the Gulf of Mexico.
W91-01933 5A

Influence of Temperature and Organic Amendments on the Mobilization of Selenium in Sediments.
W91-01990 5B

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments I. The Limski Kanal (North Adriatic Sea).
W91-02009 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments II. The Krka River Estuary and the Kornati Islands (Central Adriatic Sea).
W91-02010 5B

SEDIMENT CONTROL
Suspended Sediment and Bed Load Problems of the Upper Rhine.
W91-01871 4D

SEDIMENT DISCHARGE
Rates and Mechanisms of Discontinuous Gully Erosion in a Red-Brown Earth Catchment, New South Wales, Australia.
W91-01877 2J

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

SEDIMENT DISTRIBUTION
Geochronology for Polycyclic Aromatic Hydrocarbon Contamination in Sediments of the Saguenay Fjord.
W91-01183 5B

Peculiarities of the Formation of Bottom Deposits in a Closed-Cooling Pond.
W91-01444 8C

Lateral Distribution of Suspended Sediments in Nearshore Water of Muddy Coast of Lianyungang Harbour (in Chinese).
W91-01567 2J

Hydrographic Surveys and Sedimentation in Deep Bay, Hong Kong.
W91-01883 2J

Supply and Deposition of Sediment along the North Bank of Hangzhou Bay, China.
W91-01942 2J

Heavy Metals in Sediments of the Yamuna River (A Tributary of the Ganges), India.
W91-02005 2K

Iron and Manganese Geochemistry and the Distribution of 239, 240 Pu and 241 Am in the Sediments of the North East Irish Sea.
W91-02006 5B

Distribution of Zinc, Lead, Cadmium and Copper Between Different Size Fractions of Sediments II. The Krka River Estuary and the Kornati Islands (Central Adriatic Sea).
W91-02010 5B

SEDIMENT EROSION
Monitoring the Erosion of an Expressway During Its Construction: Problems and Lessons.
W91-01459 2J

Modeling Erosion of Sand and Silt Bed River.
W91-01492 2J

Evaluate a Soil Loss Prediction Model Combined with an Infiltration Model for Tilled Soils.
W91-01861 2G

Influence of Debris Flows on Channels and Valley Floors in the Oregon Coast Range, U.S.A.
W91-01882 2J

SEDIMENT LOAD
Statistical Characteristics of Some Estimators of Sediment and Nutrient Loadings.
W91-01538 2J

Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

SEDIMENT POLLUTION
Partitioning of Lindane Between Sediment, Water and the Crustacean Metapenaeus macleayi.
W91-02042 5B

SEDIMENT TRANSPORT
Dissolved and Suspended Solids Transport from Coastal Plain Watersheds.
W91-01011 5B

Leaching of Radionuclides from Decaying Blueberry Leaves: Relative Rate Independent of Concentration.
W91-01018 5B

Variations in Suspended Sediment and Associated Trace Element Concentrations in Selected Riverine Cross Sections.
W91-01061 2J

Flow and Particle Paths at a Natural River Confluence with Coarse Bed Material.
W91-01071 2J

Variability of Particle Size Characteristics of Sheetwash Sediments and Fluvial Suspended Sediment in a Small Semiarid Catchment, Kenya.
W91-01084 2J

Spatial Scale Dependence of Sediment Dynamics in a Semi-Arid Badland Drainage Basin.
W91-01085 2J

Longitudinal Dispersion Processes in the Upper Tamar Estuary.
W91-01127 2L

Determination of the Origin of Suspended Matter and Sediments in the Elbe Estuary Using Natural Tracers.
W91-01132 2L

LIBRARY U. OF I. URBANA-CHAMP.

SEDIMENT TRANSPORT

Suspension and Settlement of Particles in Flowing Water: Comparison of the Effects of varying water depth and velocity in Circulating Channels.
W91-01340 2J

Estimate of Snow Avalanche Debris Transport, Kaghan Valley, Himalaya, Pakistan.
W91-01371 2J

Development of Bed Features.
W91-01491 2J

Modeling Erosion of Sand and Silt Bed River.
W91-01492 2J

Changes in Stream Morphology and Storm Transport of Seston Following Watershed Disturbance.
W91-01505 2J

Lateral Distribution of Suspended Sediments in Nearshore Water of Muddy Coast of Lianyungang Harbour (in Chinese).
W91-01567 2J

Comparison Between Measured Wave Properties and Simple Wave Hindcasting Models in Shallow Water.
W91-01671 8B

Modelling of Sandwave Evolution Resulting from Suspended and Bed Load Transport of Sediment.
W91-01675 8B

Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

Minimum Froude Number and the Equilibrium of Alluvial Sand Rivers.
W91-01874 2E

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

Development of Armour in the Tambo River, Victoria, Australia.
W91-01880 2J

Mud Balance for Belgian-Dutch Coastal Waters Between 1969 and 1986.
W91-01934 2J

Supply and Deposition of Sediment along the North Bank of Hangzhou Bay, China.
W91-01942 2J

Applications of Magnetic Measurements to Sediment Tracing in Urban Highway Environments.
W91-01997 5A

Heavy Metals in Sediments of the Yamuna River (A Tributary of the Ganges), India.
W91-02005 2K

SEDIMENT-WATER INTERFACES

Contribution of Benthic Biomass to Overall Metabolism in New Caledonia Lagoon Sediments.
W91-01659 2L

Relationship Between Chlorinated Hydrocarbons and Organic Carbon in Sediment and Porewater.
W91-01795 5B

Experimental Use of Dialysis Chamber Arrays to Study P-Fluxes in the Bay of Quinte, 1987.
W91-01796 2H

SEDIMENT YIELD

Statistical Characteristics of Some Estimators of Sediment and Nutrient Loadings.
W91-01538 2J

Rates and Mechanisms of Discontinuous Gully Erosion in a Red-Brown Earth Catchment, New South Wales, Australia.
W91-01877 2J

Blanket Peat Erosion in a Mid-Wales Catchment During Two Drought Years.
W91-01881 2J

SEDIMENTATION

Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

Chemical and Physical Speciation of Trace Metals in Fine Grained Overbank Flood Sediments in the Tyne Basin, North-East England.
W91-01082 5B

Variability of Particle Size Characteristics of Sheetwash Sediments and Fluvial Suspended Sediment in a Small Semiarid Catchment, Kenya.
W91-01084 2J

Spatial Scale Dependence of Sediment Dynamics in a Semi-Arid Badland Drainage Basin.
W91-01085 2J

Peculiarities of the Formation of Bottom Deposits in a Closed-Cooling Pond.
W91-01444 8C

Optimal Artificial Recharge in Intermittent Multibasin System.
W91-01554 4B

Nonlinear Solution of Aggradation and Degradation in Channels.
W91-01668 2J

River Discharge and Tidal Controls on Salt-Wedge Position and Implications for Channel Shoaling: Fraser River, British Columbia.
W91-01722 2L

Sediment Transport and Accretion and the Hydrologic Environment of Grove Creek Near Kenansville, North Carolina.
W91-01839 2J

Suspended Sediment and Bed Load Problems of the Upper Rhine.
W91-01871 4D

Hydrographic Surveys and Sedimentation in Deep Bay, Hong Kong.
W91-01883 2J

Revised Estimate of the Life Span for Lake Nasser.
W91-01884 2H

Supply and Deposition of Sediment along the North Bank of Hangzhou Bay, China.
W91-01942 2J

SEDIMENTATION BASINS

Influence of Water Chemistry on Suspended Solids in Coal Mine Sedimentation Ponds.
W91-01013 5D

SEDIMENTATION RATES

Suspension and Settlement of Particles in Flowing Water: Comparison of the Effects of varying water depth and velocity in Circulating Channels.
W91-01340 2J

Fate of Macrozoobenthos in Hypertrophic Lakes: In Situ Rearing Experiments with the Larvae of Tokunagayusurika akamusi (Chironomidae).
W91-01769 5C

Hydrographic Surveys and Sedimentation in Deep Bay, Hong Kong.
W91-01883 2J

SEDIMENTOLOGY

Biosedimentology and Paleohydrology of Holocene Stromatolites from Lake Tanganyika (Biosedimentologie des Stromatolites Holocenes du lac Tanganyika (Burundi). Implications Hydrologiques).
W91-01372 2J

Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

SEDIMENTS

Measurement of CO2-Fixation in Sediments: Some Theoretical and Technical Aspects.
W91-01586 2J

Measurement of Exoenzymatic Activity in Streambed Sediments Using Methylumbelliferyl-Substrates.
W91-01587 2J

Method of Measuring the Dehydrogenase Activity of Sediments.
W91-01588 2J

Bacterial Productivity in Sediments.
W91-01608 2H

Butyltins in Sediments and Bivalves from U.S. Coastal Areas.
W91-01735 5B

Influence of Organic Sediment Amendments on Growth and Tuber Production by Potamogeton pectinatus L.

Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part I, Methodology and Field Site Characterization.
W91-01789 5G

Performance of Selected In Situ Soil Decontamination Technologies: An Air Force Perspective.
W91-01949 5G

Design Considerations for Soil Cleanup by Soil Vapor Extraction.
W91-01952 5G

SLOPE STABILITY
Design of Rock Slopes in Soviet Hydropower Construction Practice.
W91-01433 8A

Analytical Method of Calculating Slope Stability.
W91-01434 8D

Correspondence of the Scheme and Method of Calculating the Stability Factor.
W91-01436 8D

SLOPE STABILIZATION
Effective Design of Facings of Blast-formed Dams.
W91-01547 8A

SLOPING WAVES
Irregular Wave Load on Slopes of Structures.
W91-01438 8B

SLUDGE
Metal Content of Fungal Sporocarps from Urban, Rural, and Sludge-Treated Sites.
W91-01005 5B

Effect of Municipal Sewage Sludge Application on Growth of Two Reclamation Shrub Species in Copper Mine Spoils.
W91-01025 5B

Adsorption, Degradation, and Plant Availability of 2,4-Dinitrophenol in Sludge-Amended Calcareous Soils.
W91-01026 5B

Plant Uptake of Pentachlorophenol from Sludge-Amended Soils.
W91-01027 5B

Sorption and Degradation of Pentachlorophenol in Sludge-Amended Soils.
W91-01028 5B

Nitrification in Sludge-Amended Michigan Forest Soils.
W91-01029 5E

Toxicity of Water Extracts of Hazardous Waste.
W91-01231 5C

Siphoning Sludge.
W91-01485 5D

Start-Up of Low Temperature Anaerobic Reactors Using Freshwater Methanogenic Sediments.
W91-01637 5D

Seasonal Variation of Thermophilic Campylobacters in Sewage Sludge.
W91-01655 5B

SLUDGE ANALYSIS
Seasonal Variation of Thermophilic Campylobacters in Sewage Sludge.
W91-01655 5B

Preview Analysis of National Sludge Survey.
W91-01661 5E

Polynuclear Aromatic Hydrocarbon (PAH) Content of Archived Sewage Sludges.
W91-01737 5A

Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

SLUDGE CAKE
Mechanisms of Compressible Sludge Cake Shrinkage.
W91-01150 5D

SLUDGE DIGESTION
Fate of Entamoeba histolytica During Sewage Treatment Using Anaerobic Digesters.
W91-01241 5D

SLUDGE DISPOSAL
Fundamentals and Application of Windrow Composting.
W91-01154 5E

Autothermal Fluid Bed for Sludge Incineration.
W91-01244 5E

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: I. Soil Nitrogen and Heavy Metals.
W91-01503 5E

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: II. Production and Income.
W91-01504 5E

Compost Odor Control Through Process Optimization.
W91-01662 5D

Proposed EPA Sludge Disposal Regulations: Project Purgatory.
W91-01676 5E

Use of Lime-Stabilized Dairy-Plant Waste for Forage Production.
W91-01704 5E

Characterization of Compost with Respect to Its Content of Heavy Metals, Part I: Sample Digestion and ICP-AES Analysis.
W91-01986 5E

SLUDGE TREATMENT
Fate of Selected Chlorinated Organic Compounds during Semi-Continuous Anaerobic Sludge Digestion.
W91-01319 5D

Effect of Feed Composition, Aerobic Volume Fraction and Recycle Rate on Nitrogen Removal in the Single-Sludge System.
W91-01426 5D

Control of Sludge Settling Characteristics in the Single-Sludge System, A Hypothesis.
W91-01427 5D

Measuring Techniques for Gas/Solid Fluidized Bed Reactors (MeBtechniken fur Gas/Feststoff-Wirbelschichtreaktoren).
W91-01896 5D

SLUDGE UTILIZATION
Behavior of Toluene Added to Sludge-Amended Soils.
W91-01024 5B

Effect of Municipal Sewage Sludge Application on Growth of Two Reclamation Shrub Species in Copper Mine Spoils.
W91-01025 5B

Adsorption, Degradation, and Plant Availability of 2,4-Dinitrophenol in Sludge-Amended Calcareous Soils.
W91-01026 5E

Plant Uptake of Pentachlorophenol from Sludge-Amended Soils.
W91-01027 5E

Sorption and Degradation of Pentachlorophenol in Sludge-Amended Soils.
W91-01028 5E

Nitrification in Sludge-Amended Michigan Forest Soils.
W91-01029 5E

Phosphorus in Waters from Sewage Sludge Amended Lysimeters.
W91-01107 5E

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: I. Soil Nitrogen and Heavy Metals.
W91-01503 5E

Sustainable Rates of Sewage Sludge for Dryland Winter Wheat Production: II. Production and Income.
W91-01504 5E

Polynuclear Aromatic Hydrocarbon (PAH) Content of Archived Sewage Sludges.

Monitoring of Rainfall in Relation to the Control of Migrant Pests.
W91-01561 2B

Soil Solution Chemistry of an Adirondack Spodosol: Lysimetry and N Dynamics.
W91-01693 2K

Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695 2J

Clipping Date Effects on Soil Water and Regrowth in Crested Wheatgrass.
W91-01706 2G

Effect of Soil Water, Nitrogen, and Growing Degree-Days on Morphological Development of Crested and Western Wheat-Grass.
W91-01707 2I

Modelling Soil Water Supply to Crops.
W91-01869 2G

Aluminum Mobilization in Soil and Stream Waters at Three Norwegian Catchments with Different Acid Deposition and Site Characteristics.
W91-01895 5B

SOIL-WATER-PLANT RELATIONSHIPS

Phosphorus in Waters from Sewage Sludge Amended Lysimeters.
W91-01107 5B

Evapotranspiration, Water Use Efficiency, Moisture Extraction Pattern and Plant Water Relations of Rape (Brassica campestris) Genotypes in Relation to Root Development Under Varying Irrigation Schedules.
W91-01114 2D

Climate and Vegetation in China. III. Water Balance and Distribution of Vegetation.
W91-01125 2I

Heat Stress, Plant-Available Soil Moisture, and Corn Yields in Iowa: A Short- and Long-Term View.
W91-01703 3F

Cropping System and Tillage Effects on Available Soil Water and Yield of Grain Sorghum and Winter Wheat.
W91-01705 3F

Effect of Soil Water, Nitrogen, and Growing Degree-Days on Morphological Development of Crested and Western Wheat-Grass.
W91-01707 2I

Influence of Organic Sediment Amendments on Growth and Tuber Production by Potamogeton pectinatus L.
W91-01740 2I

Modelling Soil Water Supply to Crops.
W91-01869 2G

OIL WATER POLLUTION

Partitioning of Lindane Between Sediment, Water and the Crustacean Metapenaeus macleayi.
W91-02042 5B

OIL WATER TABLE

Simplified Analysis of Soil Water Flow to a Mole Drain.
W91-01476 2G

OLAR PONDS

Use of Solar Ponds in the Disposal of Desalting Concentrate.
W91-01982 5E

SOLAR RADIATION

Thunderstorms, Cosmic Rays, and Solar-Lunar Influences.
W91-01490 2B

SOLID WASTE DISPOSAL

Stemming the Tide of Marine Debris Pollution: Putting Domestic and International Control Authorities to Work.
W91-01093 5G

Immobilization Mechanisms in Solidification/Stabilization of Cd and Pb Salts Using Portland Cement Fixing Agents.
W91-01182 5G

Consolidation and Contaminant Migration in a Capped Dredged Material Deposit.
W91-01453 5E

SOLID WASTES

Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

SOLIDS

Measuring Techniques for Gas/Solid Fluidized Bed Reactors (MeBtechniken fur Gas/Feststoff-Wirbelschichtreaktoren).
W91-01896 5D

SOLUTE TRANSPORT

Longitudinal Dispersion Processes in the Upper Tamar Estuary.
W91-01127 2L

Dual Water Flow Pattern in the Unsaturated Zone under a Gypsum-amended Soil.
W91-01475 2G

Calibration and Validation of a Model of Non-Interactive Solute Leaching in a Clay-Loam Arable Soil.
W91-01477 7C

Release of Cationic Aluminium from Acidic Soils into Drainage Water and Relationships with Land Use.
W91-01479 5B

Soil and Soil Solution Chemical Composition at Three Sites within the Loch Dee Catchment, SW Scotland.
W91-01480 2K

Solute Transport with Multisegment, Equilibrium-Controlled Reactions: A Feed Forward Simulation Method.
W91-01520 5B

Mass Arrival of Sorptive Solute in Heterogeneous Porous Media.
W91-01521 5B

Mean Square Error of Regression-Based Constituent Transport Estimates.
W91-01522 5B

Substrate and Biomass Transport in a Porous Medium.
W91-01534 2F

Approximate Solutions for Cation Transport During Unsteady, Unsaturated Soil Water Flow.
W91-01535 2G

SOLUTES

Diurnal Variations in the Inorganic Solute Content of Water Draining from an Alpine Snowpatch.
W91-01083 2K

SOLVENTS

Chlorinated Solvents in UK Aquifers.
W91-01271 5B

SORGHUM

Cropping System and Tillage Effects on Available Soil Water and Yield of Grain Sorghum and Winter Wheat.
W91-01705 3F

SORPTION

Sorption of Napropamide on Clay and Soil in the Presence of Dissolved Organic Matter.
W91-01023 5B

Estimating the Effects of Dispersed Organic Polymers on the Sorption of Contaminants by Natural Solids. 2. Sorption in the Presence of Humic and Other Natural Macromolecules.
W91-01180 5B

Modeling Organic Contaminant Sorption Impacts on Aquifer Restoration.
W91-01827 5B

SOUNDING

Use of Resistivity Soundings to Determine Landfill Structure.
W91-01786 5B

SOUTH AFRICA

Environmental Factors Affecting the Production of Peptide Toxins in Floating Scums of the Cyanobacterium Microcystis aeruginosa in a Hypertrophic African Reservoir.
W91-01065 2H

Treatment of Eutrophic Waters in South Africa.
W91-01074 5F

Environmental Evaluation Procedure for Coastal Developments in South Africa.
W91-01122 6B

Application of the HSPF Model to Water Management in Africa.
W91-01199 6B

Leakage Control in a Universally Metered Distribution System: Pinetown Water's Experience.
W91-01270 3D

Seasonal Changes in the Dissolved Free Amino Acid and DOC Concentrations in a Hypertrophic African Reservoir and Its Inflowing Rivers.
W91-01356 2H

Use of Daily Values of Surface Parameters at Durban and Cape Town to Determine the Precipitable Water Content of the Atmosphere.
W91-01660 2B

SOVIET UNION

Mechanism of the Opening of the Concrete-Rock Joint in the Sayano-Shushenskoe Dam.
W91-01441 8F

Further Exploratory Evaluations of Grossversuch IV Using Hailpad Data: Analysis of Hail Patterns and Stratification by Storm Type for Seeding Effect.
W91-01471 2B

Mechanical Equipment of the Tikhovsk Hydro Development on the Kuban River.
W91-01540 8C

Monitoring the State of the Dam of the Sayano-Shushenskoe Hydroelectric Station.
W91-01541 8A

Initial Period of Operation of the Channel Dam of the Kureika Hydroelectric Station.
W91-01542 8A

Experience in Operating Ecologically Clean Turbines.
W91-01543 8C

Downstream of the Novosibirsk Hydroelectric Station on the Ob River.
W91-01544 4A

Current Problems and Practice of Engineering-Geological Surveys when Designing Large Reservoirs.
W91-01545 6G

Mechanical Equipment of the Tashlyk Pumped-Storage Hydroelectric Station and Aleksandrovka Hydro Development of the Southern Ukraine Power Complex.
W91-01644 8C

Mechanical Equipment of the Vilyui No. 3 Hydroelectric Station.
W91-01645 8C

Investigation of the Diversion Outlet of the Kirzan Hydro Development.
W91-01646 8B

Effect of the Riga Hydroelectric Station on the Current Velocity Near Wharves of the Riga Commercial Seaport.
W91-01647 8B

Seepage in Earth Dams in Two- and Three-Dimensional Formulations of the Problem.
W91-01650 8D

Causes and Character of Movements of the Loamy Sand Moraine in the Foundation of the Plyavinyas Hydroelectric Station Powerhouse.
W91-01651 8D

Geodetic Problems in the Construction of High Concrete Dams.
W91-01652 8A

SPAIN
Humus Form Development and Hillslope Runoff, and the Effect of Fire and Management, Under Mediterranean Forest in NE-Spain.
W91-01079 2G

Relationship Between Water Quality and Caddisfly Assemblage Structure in Fast-Running Rivers. The River Cadagua Basin.
W91-01697 5A

Fate of Cationic Surfactants in the Marine Environment: I. Bioconcentration of Long-Chain Alkylnitriles and Trialkylamines.
W91-01723 5B

Solution-Collapse Depressions and Suspensates in the Limnocrenic Lake of Banyoles (Ne Spain).
W91-01876 2J

Application of Multivariate Analysis for Characterization of Organic Compounds from Urban Runoff.
W91-02004 5A

SPARTA AQUIFER
Geohydrologic Characteristics and Simulated Response to Pumping Stresses in the Sparta Aquifer in East-Central Arkansas.
W91-01854 2F

SPATIAL DISTRIBUTION
Spatial and Temporal Patterns in the Hydrogeochemistry of a Poor Fen in Northern Wisconsin.
W91-01720 2H

Spatial and Seasonal Differences in the PCB Content of the Mussel Mytilus edulis.
W91-01819 5B

Chemical Composition of Bulk Precipitation Across the Mountains of Snowdonia, U.K.
W91-01820 2B

Spatial and Temporal Dispersion Patterns of Golden Perch, Macquaria ambigua, Larvae in an Artificial Floodplain Environment.
W91-01957 2H

SPECIATION
Chemical and Physical Speciation of Trace Metals in Fine Grained Overbank Flood Sediments in the Tyne Basin, North-East England.
W91-01082 5B

Speciation of Mercury Compounds in Waste Water by Microcolumn Liquid Chromatography Using a Preconcentration Column with Cold-Vapor Atomic Absorption Spectrometric Detection.
W91-01716 5A

SPECIES COMPOSITION
Macroinfaunal Community of a Tropical Estuarine Lagoon.
W91-01133 2L

Colonization Process of a Typical Epilithic Algal Community--Homoeothrix janthina-Achnanthes japonica Community--in a Less Polluted River in Japan (in Japanese).
W91-01383 2H

Effect of Extracellular Organic Carbon (EOC) from Phytoplankton on the Community Structure of Oligotrophic Bacteria.
W91-01590 2H

Benthic Community Structure and the Effect of Rotenone Piscicide on Invertebrate Drift and Standing Stocks in Two Papua New Guinea Streams.
W91-01767 2H

SPECIES DIVERSITY
Mangrove Ecology, Aquatic Primary Productivity, and Fish Community Dynamics in the Teacapan-Agua Brava Lagoon-Estuarine System (Mexican Pacific).
W91-01137 2H

Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

Environmental Factors Affecting Benthic Infaunal Communities of the Western Arabian Gulf.
W91-01626 2L

Relationship Between Water Quality and Caddisfly Assemblage Structure in Fast-Running Rivers. The River Cadagua Basin.
W91-01697 5A

Algae, Other Than Diatoms, Affecting the Density, Species Richness and Diversity of Diatom Communities in Rivers.
W91-01765 2H

Study of Aquatic Community Dynamics in a Karstic System by the Use of Artificial Substrates.
W91-01766 2H

Response of Attached Bacteria to Zinc in Artificial Streams.
W91-01772 5C

SPECTRAL ANALYSIS
Determination from Space of Atmospheric Total Water Vapor Amounts by Differential Absorption near 940 nm: Theory and Airborne Verification.
W91-01472 7B

Determination of Trace Quantities of Organotin Compounds in Coastal Waters of Greece by Graphite Furnace Atomic Absorption Spectrometry.
W91-01823 5A

SPECTROMETRY
Analysis of 228Ra and 226Ra in Public Water Supplies by a Gamma-Ray Spectrometer.
W91-01667 5A

On-Line Continuous-Flow Extraction System in Liquid Chromatography with Ultraviolet and Mass Spectrometric Detection for the Determination of Selected Organic Pollutants.
W91-01711 5A

SPECTROPHOTOMETRY
Automated Method for the Determination of Boron in Water by Flow-Injection Analysis with In-Line Preconcentration and Spectrophotometric Detection.
W91-01713 5A

SPHAGNUM
Nutrient Dynamics in a Floating Mat and Pond System with Special Reference to Its Vegetation.
W91-01126 2H

Sphagnum-Dominated Peatlands of the Hyperoceanic British Columbia Coast: Patterns in Surface Water Chemistry and Vegetation.
W91-01692 2H

SPILLWAYS
Hydraulic Jump in Triangular Channel.
W91-01669 8E

Bearspaw Development: Design and Construction of a Side-Channel Overflow Spillway.
W91-01721 8E

SPIROGYRA
Spirogyra Species and Accompanying Algae from Pools and Ditches in The Netherlands
W91-01333 5C

SPOIL BANKS
Relationships Between Wetland Fragmentation and Recent Hydrologic Changes in a Deltaic Coast.
W91-01903 2I

SPOIL DISPOSAL
Consolidation and Contaminant Migration in Capped Dredged Material Deposit.
W91-01453 5I

SPRAY IRRIGATION
Sources and Distribution of Nitrate in Groun Water at a Farmed Field Irrigated with Sewag Treatment-Plant Effluent, Tallahassee, Florid
W91-01857 5I

SPRINGS
Elucidating Ground-Water Flow Paths in Desert Terrane by Geochemical Methods.
W91-01784 2

Tritium Concentrations in Flow from Selecte Springs that Discharge to the Snake River, Tw Falls-Hagerman Area, Idaho.
W91-01833 5

SPRINKLER IRRIGATION
Water and Fertilizer Interrelations with Irriga ed Maize.
W91-01408 3

SPRUCE TREES
Effects of Clearfelling a Sitka Spruce Stand the Water Balance of a Peaty Gley Soil at Ke shope Forest, Cumbria.
W91-01069 4

ST LAWRENCE ESTUARY
Properties of Unstable Waves in the Lower St. Lawrence Estuary.
W91-01431 2L

ST LAWRENCE RIVER
Morphological Deformities in Chironomidae(Diptera) Larvae from the Lac St. Louis and Laprairie Basins of the St. Lawrence River.
W91-01790 5C

STABILIZATION LAGOONS
Innovative Management of an Aerated/Facultative Lagoon Suspended-Growth Biological Treatment System for High Strength Industrial Waste Stabilization.
W91-01950 5D

STABILIZATION PONDS
Tracer Study of the Hydraulics of Facultative Stabilization Ponds.
W91-01424 5D

STANDING WATERS
Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695 2J

STATE JURISDICTION
Federal-State Tensions in Australian Environmental Management: The World Heritage Issue.
W91-01102 6G

Queensland Rainforest and Wetlands Conflict: Australia's External Affairs Power--Domestic Control and International Conservation.
W91-01104 6E

In Re Water of Hallett Creek System.
W91-01120 6E

Federal and State Roles in Environmental Enforcement: A Proposal for a More Effective and More Efficient Relationship.
W91-01624 5G

California v. FERC: State Regulation of Federal Hydropower.
W91-01629 6E

Comparative Analysis of State Environmental Policy.
W91-01630 6G

STATISTICAL ANALYSIS
Frequency Analysis of Trace Level Water Quality Data with a Time Varying Censoring Level.
W91-01198 5B

Ecological Correlation Between Arsenic Level in Well Water and Age-adjusted Mortality from Malignant Neoplasms.
W91-01292 5C

Time Scales and Variability of Area-Averaged Tropical Oceanic Rainfall.
W91-01446 2B

Meta-Analytic Reappraisal of Statistical Results in the Environmental Sciences: The Case of a Hydrological Effect of Cloud Seeding.
W91-01470 3B

Statistical Characteristics of Some Estimators of Sediment and Nutrient Loadings.
W91-01538 2J

Integration of Long-Term Fish Kill Data with Ambient Water Quality Monitoring Data and Application to Water Quality Management.
W91-01635 5C

Causes of Temporal Variability of Lead in Domestic Plumbing Systems.
W91-01698 5B

Decreasing Chloride Trends Observed at Lake Erie Municipal Water Intakes.
W91-01793 5G

Empirical Evidence for Differences Among Methods for Calculating Secondary Production.
W91-01808 7C

Distribution of Hydrocarbon Concentrations from Urban Runoff.
W91-01998 5B

STATISTICAL METHODS
Multivariate Statistical Analyses of Sediment Geochemistry.
W91-01161 2L

Meta-Analytic Reappraisal of Statistical Results in the Environmental Sciences: The Case of a Hydrological Effect of Cloud Seeding.
W91-01470 3B

Empirical Evidence for Differences Among Methods for Calculating Secondary Production.
W91-01808 7C

STATISTICAL MODELS
Stepwise Time Series Regression Procedure for Water Demand Model Identification.
W91-01509 6D

Lateral Distribution of Suspended Sediments in Nearshore Water of Muddy Coast of Lianyungang Harbour (in Chinese).
W91-01567 2J

New Snow in the Urban Area of Vienna (Neuschnee im Raum Wien).
W91-01584 2B

STATISTICS
Empirical Evidence for Differences Among Methods for Calculating Secondary Production.
W91-01808 7C

STOCHASTIC HYDROLOGY
Stochastic Models of Streamflow: Some Case Studies.
W91-01461 2E

STOCHASTIC MODELS
Stochastic Analysis of Unsaturated Flow: One-Dimensional Monte Carlo Simulations and Comparisons With Spectral Perturbation Analysis and Field Observations.
W91-01536 2G

STONEFLIES
Stonefly Predation Along a Hydraulic Gradient: A Field Test of the Harsh--Benign Hypothesis.
W91-01347 2H

Associations of Aquatic Insects (Ephemeroptera, Plecoptera, and Trichoptera) in a Network of Subarctic Lakes and Streams in Quebec.
W91-01349 2H

Annual Stonefly (Plecoptera) Production in a Second Order Oklahoma Ozark Stream.
W91-01506 2H

STORAGE COEFFICIENT
Interbed Storage Changes and Compaction in Models of Regional Groundwater Flow.
W91-01513 2F

STORM-OVERFLOW SEWERS
Pollution Aspects of Storm-Sewage Overflows.
W91-01268 5B

STORM RUNOFF
SWMM-4.
W91-01191 4C

Application of SWMM in the New Orleans Area.
W91-01195 4C

PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

Flood Hydrograph for Ungaged Watershed.
W91-01207 7C

Gulf Coast Flood Routing.
W91-01210 2E

Changes in Stream Morphology and Storm Transport of Seston Following Watershed Disturbance.
W91-01505 2J

Problems in Determining the Return of a Watershed to Pretreatment Conditions: Techniques Applied to a Study at Caspar Creek, California.
W91-01523 4C

Peak-Flow Characteristics of Small Urban Drainage Along the Wasatch Front, Utah.
W91-01834 4C

Substance Load in Rainwater Runoff from Different Streets in Hamburg.
W91-01993 5B

Applications of Magnetic Measurements to Sediment Tracing in Urban Highway Environments.
W91-01997 5A

U. S. Federal Highway Administration's Receiving Water Impact Methodology.
W91-02000 5G

STORM WASTEWATER
Pollution Aspects of Storm-Sewage Overflows.
W91-01268 5B

STORM WATER
Proceedings of Stormwater and Water Quality Model Users Group Meeting.
W91-01188 5G

User Defined Conduits in the EXTRAN Block of SWMM.
W91-01189 4C

Evaluation of Detention Basin Performance in the Piedmont Region of North Carolina.
W91-01824 5G

STORM WATER MANAGEMENT
Proceedings of Stormwater and Water Quality Model Users Group Meeting.
W91-01188 5G

Improvements to Surcharge Calculations in EXTRAN.
W91-01192 7C

Modeling Studies for the City of Austin Stormwater Monitoring Programs.
W91-01194 4C

Multi-Model Micro-Computer Based Wet Detention Basin Design Methodology.
W91-01200 4C

Computer Aided Planning of Drainageway Improvements Made Easy with LOTUS 1-2-3.
W91-01205 7C

STORM WATER MANAGEMENT MODEL
User Defined Conduits in the EXTRAN Block of SWMM.
W91-01189 4C

Revised Runoff Block of SWMM.
W91-01190 4C

SWMM-4.
W91-01191 4C

Improvements to Surcharge Calculations in EXTRAN.
W91-01192 7C

LIBRARY U. S. DEPT. OF AGRICULTURE

STORM WATER MANAGEMENT MODEL

Application of SWMM in the New Orleans Area.
W91-01195 4C

Use of SWMM/EXTRAN and TR-20 to Develop Regional Stormwater Detention Plans in the Washington, D.C. Region.
W91-01196 4C

STORMS

Further Exploratory Evaluations of Grossversuch IV Using Hailpad Data: Analysis of Hail Patterns and Stratification by Storm Type for Seeding Effect.
W91-01471 2B

Precipitation and Environmental Conditions during Accretion in Canadian East Coast Winter Storms.
W91-01487 2B

Extreme, Singular and Coherent Precipitation in the Catchment Basin of the Upper Inn River (Extreme, Singulaere und Kohaerente Niedersclaege im Gebiet des Aplinen Inn).
W91-01583 2B

STRATIFICATION

Tidal Straining, Density Currents, and Stirring in the Control of Estuarine Stratification.
W91-01128 2L

Salinity Stratification in a River-Dominated Estuary.
W91-01130 2L

STRATIGRAPHY

Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

STREAM BANKS

Numerical Simulation of Gravel River Widening.
W91-01516 2J

STREAM BIOTA

Growth and Voltinism of Lotic Midge Larvae: Patterns Across an Appalachian Mountain Basin.
W91-01038 2H

Micro-Arthropod Seasonality in Streams of Varying pH.
W91-01339 2H

Annual Stonefly (Plecoptera) Production in a Second Order Oklahoma Ozark Stream.
W91-01506 2H

Studies on the Chemistry of Interstitial Water Taken from Defined Horizons in the Fine Sediments of Bivalve Habitats in Several Northern German Lowland Waters: I. Sampling Techniques.
W91-01768 2H

Effects of Short-term Pulses of Atrazine on Attached Algal Communities in a Small Stream.
W91-02040 5C

STREAM CLASSIFICATION

Perspective on America's Vanishing Streams.
W91-01812 6G

STREAM CONSERVATION

Perspective on America's Vanishing Streams.
W91-01812 6G

STREAM DISCHARGE

Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

STREAM ECOLOGY

Forests and the Temperature of Upland Streams in Wales: A Modelling Exploration of the Biological Effects.
W91-01343 2E

Ecology of Two Intermittent Streams in Victoria, Australia. I. Multivariate Analyses of Physicochemical Features.
W91-01344 2E

Modelling Black Fly Production Dynamics in Blackwater Streams.
W91-01346 2H

Stonefly Predation Along a Hydraulic Gradient: A Field Test of the Harsh--Benign Hypothesis.
W91-01347 2H

Associations of Aquatic Insects (Ephemeroptera, Plecoptera, and Trichoptera) in a Network of Subarctic Lakes and Streams in Quebec.
W91-01349 2H

Effect of Hydropower Peaking Flow Fluctuations on Community Structure and Feeding Guilds of Invertebrates Colonizing Artificial Substrates in a Large Impounded River.
W91-01357 4C

Annual Stonefly (Plecoptera) Production in a Second Order Oklahoma Ozark Stream.
W91-01506 2H

Reaction of Microbial Periphyton to Substrate Concentration Changes in a Running Water Model.
W91-01603 2H

Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

Benthic Community Structure and the Effect of Rotenone Piscicide on Invertebrate Drift and Standing Stocks in Two Papua New Guinea Streams.
W91-01767 2H

STREAM EROSION

Modeling Erosion of Sand and Silt Bed River.
W91-01492 2J

Theoretical Model of Optimal Drainage Networks.
W91-01526 2E

STREAM FISHERIES

Potential Loss of Thermal Habitat for Brook Trout, Due to Climatic Warming, in Two Southern Ontario Streams.
W91-01397 8I

STREAM POLLUTION

Interaction Between Components of Electroplating Industry Wastes, Influence of the Receiving Water on the Toxicity of the Effluent.
W91-01106 5C

STREAM PROFILES

Channel Sediment Variability Along a River: A Case Study of the Siret River (Romania).
W91-01875 2E

STREAMBEDS

Development of Bed Features.
W91-01491 2J

Development of Armour in the Tambo River, Victoria, Australia.
W91-01880 2J

STREAMFLOW

Analytical Asymptotic Solutions for Longitudinal Dispersion with Dead Zones.
W91-01672 8B

STREAMFLOW FORECASTING

Stochastic Models of Streamflow: Some Case Studies.
W91-01461 2E

Prediction Model for Snowmelt, Snow Surface Temperature and Freezing Depth Using a Heat Balance Method.
W91-01469 2C

Perspective on El Nino and La Nina: Global Implications for Stream Ecology.
W91-01811 2B

STREAMS

Denitrification in Nitrate-Rich Streams: Diurnal and Seasonal Variation Related to Benthic Oxygen Metabolism.
W91-01142 2H

Macroinvertebrate Community Responses to Copper in Laboratory and Field Experimental Streams.
W91-01312 5C

Changes in Stream Morphology and Storm Transport of Seston Following Watershed Disturbance.
W91-01505 2J

Measurement of Exoenzymatic Activity in Streambed Sediments Using Methylumbelliferyl-Substrates.
W91-01587 2J

Reaction of Microbial Periphyton to Substrate Concentration Changes in a Running Water Model.
W91-01603 2H

Interstitial Dissolved Organic Carbon in Sediments of a Southern Appalachian Headwater Stream.
W91-01804 2H

Distribution and Primary Productivity of the Epizoic Macroalga Boldia erythrosiphon (Rhodophyta) in a Small Alabama Stream.
W91-01805 2H

Perspective on America's Vanishing Streams.
W91-01812 6G

Stability of Periphyton and Macroinvertebrates to Disturbance by Flash Floods in a Desert Stream.
W91-01924 2H

Discharge-Export Relationships in Headwater Streams: The Influence of Invertebrate Manipulations and Drought.
W91-01925 2H

STRESS ANALYSIS

Initial Period of Operation of the Channel Dam of the Kureika Hydroelectric Station.
W91-01542 8A

Effects of Water-Borne Cadmium on Plasma Cortisol and Glucose in the Cichlid Fish Oreochromis mossambicus.
W91-01777 5C

STRIPED BASS

Temperature Selection by Striped Bass in a Gul of Mexico Coastal River System.
W91-01385 8I

Effect of Hardness and Salinity on Survival o Striped Bass Larvae.
W91-01386 8I

Temperature-Oxygen Habitat for Freshwate and Coastal Striped Bass in a Changing Climate
W91-01393 2I

STROMATOLITES
Biosedimentology and Paleohydrology of Holocene Stromatolites from Lake Tanganyika (Biosedimentologie des Stromatolites Holocenes du lac Tanganyika (Burundi). Implications Hydrologiques).
W91-01372 2J

STRONTIUM
Study on Geochemistry and Geochemical Classification of Elements B, F, Rb and Sr in Yellow Sea (Huang Hai) Sediments.
W91-01566 2J

STRUCTURAL BEHAVIOR
Association of Benzo(a)Pyrene with Dissolved Organic Matter: Prediction of K(dom) from Structural and Chemical Properties of the Organic Matter.
W91-01727 5B

STRUCTURAL ENGINEERING
Reinforcement of In-Service Retaining Structures.
W91-01442 8A

SUBLETHAL EFFECTS
Metabolic Response of Grass Shrimp Palaemonetes kadiakensis Rathbun, to Acute Exposure of Sublethal Changes in pH.
W91-01366 5C

Effects of Sublethal Exposure to Chlorine on the Uptake of Polychlorinated Biphenyl Congeners by Rainbow Trout, Salmo gairdneri (Richardson).
W91-01367 5C

SUBMERGED AQUATIC PLANTS
Effect of Submersed Aquatic Vegetation on Phytoplankton and Water Quality in the Tidal Freshwater Potomac River.
W91-01743 2H

Benthic Macrophyte Community Core Sampler.
W91-01747 7B

SUBSIDENCE
Processes Governing Marsh Formation in a Rapidly Subsiding Coastal Environment.
W91-01088 2L

Unexpected Hydrologic Perturbation in an Abandoned Underground Coal Mine: Response to Surface Reclamation.
W91-01098 4C

Interbed Storage Changes and Compaction in Models of Regional Groundwater Flow.
W91-01513 2F

SUBSTRATES
Measurement of Exoenzymatic Activity in Streambed Sediments Using Methylumbelliferyl-Substrates.
W91-01587 2J

SUBTROPIC ZONE
Cananeia Lagoon Estuarine System, Sao Paulo, Brazil.
W91-01135 2L

SUCCESSION
Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

Stability of Periphyton and Macroinvertebrates to Disturbance by Flash Floods in a Desert Stream.
W91-01924 2H

Succession of the Plankton Community during Coastal Reclamation with the Solid Wastes.
W91-01943 5E

SULFATES
Molybdenum and Sulfate as Controls on the Abundance of Nitrogen-Fixing Cyanobacteria in Saline Lakes in Alberta.
W91-01034 2H

Anaerobic Treatment of Baker's Yeast Wastewater: II. Sulfate Removal.
W91-01322 5D

Seasonal Description of the Quality and Quantity of Snowmelt in a Mountainous Region Using an Integrated Model.
W91-01460 2C

Effect of Sulfate and Organic Carbon Supplements on Reductive Dehalogenation of Chloroanilines in Anaerobic Aquifer Slurries.
W91-01760 5B

Selenium as a Nutrient for Freshwater Bacterioplankton and Its Interactions with Phosphorus.
W91-01802 2H

SULFUR
Dry Deposition of Sulfur: a 23-Year Record for the Hubbard Brook Forest Ecosystem.
W91-01411 5B

SULFUR BACTERIA
Seasonal Variations of Population Density and Activity of Sulfate-Reducing Bacteria in Offshore and Reed Sediments of a Hypertrophic Freshwater Lake.
W91-01072 2H

SULFUR COMPOUNDS
Unusual Marine Ecosystem in the Flooded Crater of Ushisher Volcano.
W91-01932 2L

SULFURIC ACID
Comparison of the Acidification Efficiencies of Nitric and Sulfuric Acids by Two Whole-Lake Addition Experiments.
W91-01143 5B

Rainwater Acidity at Jabiru, Australia, in the Wet Season of 1983/84.
W91-01818 5B

SUPERCRITICAL GASES
Supercritical Fluid Extraction and Its Application to Environmental Analysis.
W91-01916 5A

SUPERVISORY CONTROL
Balancing the SCADA Equation for the First-Time User.
W91-01564 7B

SURFACE-GROUNDWATER RELATIONS
Simplified Analysis of Soil Water Flow to a Mole Drain.
W91-01476 2G

Stream Functions and Equivalent Freshwater Heads for Modeling Regional Flow of Variable-Density Groundwater. 2. Application and Implications for Modeling Strategy.
W91-01525 2F

Tidal Dynamics of the Water Table in Beaches.
W91-01528 2F

Standing-Water Deposits as Indicators of Late Quaternary Dune Migration in the Northwestern Negev, Israel.
W91-01695 2J

Hydrology of the Powder River Alluvium Between Sussex, Wyoming, and Moorhead, Montana.
W91-01852 2F

SURFACE IRRIGATION
Estimation of Manning's Roughness Coefficient for Basin and Border Irrigation.
W91-01406 3F

SURFACE RUNOFF
Simplified Analysis of Soil Water Flow to a Mole Drain.
W91-01476 2G

Decontamination of Highway Surface Runoff in the FRG.
W91-02002 5G

SURFACE SEALING
Rainfall Induced Soil Seal (C) A Dynamic Model with Kinetic Energy Instead of Cumulative Rainfall as Independent Variable.
W91-01089 2G

Rainfall Induced Soil Seal: (A) A Critical Review of Observations and Models.
W91-01872 2G

SURFACE TENSION
Measurement of Surface Tension in Agricultural Waste Slurries.
W91-01702 5D

SURFACE WATER
Identifying Flow Paths in Models of Surface Water Acidification.
W91-01033 5B

Microbiological Quality of an Inland Surface Water Used for Recreational Purposes.
W91-01237 5B

Detection of Organic Toxic Pollutants in Water and Waste-Water by Liquid Chromatography and In Vitro Cytotoxicity Tests.
W91-01712 5A

Water Resources Data for New Mexico, Water Year 1989.
W91-01828 7C

Water Resources Data for Nebraska, Water Year 1989.
W91-01829 7C

Water Resources Data for Oregon, Water Year 1989, Volume 1. Eastern Oregon.
W91-01830 7C

Water Resources Data for Iowa, Water Year 1989.
W91-01856 7C

Water Resources Data for West Virginia, Water Year 1988.
W91-01858 7C

Water Resources Data for Michigan, Water Year 1989.
W91-01864 7C

Surface Water Discharge of Reverse Osmosis Concentrates.
W91-01979 5E

SURFACTANTS
Biodegradation and Secondary Effluent Toxicity of Ethoxylated Surfactants.
W91-01417 5D

Fate of Cationic Surfactants in the Marine Environment: I. Bioconcentration of Long-Chain Alkylnitriles and Trialkylamines.
W91-01723 5B

Fate of Cationic Surfactants in the Marine Environment, II: Photooxidation of Long-Chain Alkylamines in Aqueous Media.
W91-01733 5B

Persistent Metabolites of Alkylphenol Polyethoxylates in the Marine Environment.
W91-01754 5B

Influence of Complexing Agents and Surfactants on Metal Speciation Analysis in Road Runoff.
W91-01999 5A

Acute Toxicity of Selected Herbicides and Surfactants to Larvae of the Midge Chironomus riparius.
W91-02017 5C

SURGE IRRIGATION
Adopting Water-Conserving Irrigation Technology: The Case of Surge Irrigation in Arizona.
W91-01405 3F

SURVEYS
Some Public Attitudes About Health and the Environment.
W91-01377 6B

Hydrographic Surveys and Sedimentation in Deep Bay, Hong Kong.
W91-01883 2J

SURVIVAL
Effect of Hardness and Salinity on Survival of Striped Bass Larvae.
W91-01386 8I

Effects of Various Biophysicochemical Conditions on Toxigenicity of Vibrio cholerae 01 During Survival with a Green Alga, Rhizoclonium fontanum, in an Artificial Aquatic Environment.
W91-01801 2H

SUSPENDED LOAD
Determination of the Origin of Suspended Matter and Sediments in the Elbe Estuary Using Natural Tracers.
W91-01132 2L

SUSPENDED SEDIMENTS
Biogeochemistry of Carbon in the Amazon River.
W91-01039 5B

Variations in Suspended Sediment and Associated Trace Element Concentrations in Selected Riverine Cross Sections.
W91-01061 2J

Variability of Particle Size Characteristics of Sheetwash Sediments and Fluvial Suspended Sediment in a Small Semiarid Catchment, Kenya.
W91-01084 2J

Heavy Metal Distribution in Sediments of Krishna River Basin, India.
W91-01100 5B

Temporal Variability of Remotely Sensed Suspended Sediment and Sea Surface Temperature Patterns in Mobile Bay, Alabama.
W91-01131 2L

Determination of the Origin of Suspended Matter and Sediments in the Elbe Estuary Using Natural Tracers.
W91-01132 2L

Siltation of Stone-Surface Periphyton in Rivers by Clay-Sized Particles from Low Concentrations in Suspension.
W91-01353 2J

Problems in Determining the Return of a Watershed to Pretreatment Conditions: Techniques Applied to a Study at Caspar Creek, California.
W91-01523 4C

Sediment-Source Data for Four Basins Tributary to Lake Tahoe, California and Nevada, August 1983-June 1988.
W91-01847 2J

Suspended Sediment and Bed Load Problems of the Upper Rhine.
W91-01871 4D

Blanket Peat Erosion in a Mid-Wales Catchment During Two Drought Years.
W91-01881 2J

SUSPENDED SOLIDS
Dissolved and Suspended Solids Transport from Coastal Plain Watersheds.
W91-01011 5B

Influence of Water Chemistry on Suspended Solids in Coal Mine Sedimentation Ponds.
W91-01013 5D

Fluxes and Transformation of Aquatic Pigments in Lake Mendota, Wisconsin.
W91-01041 2H

Determination of the Origin of Suspended Matter and Sediments in the Elbe Estuary Using Natural Tracers.
W91-01132 2L

Suspension and Settlement of Particles in Flowing Water: Comparison of the Effects of varying water depth and velocity in Circulating Channels.
W91-01340 2J

Hydrographic Surveys and Sedimentation in Deep Bay, Hong Kong.
W91-01883 2J

SUSQUEHANNA RIVER
Ancient Channels of the Susquehanna River beneath Chesapeake Bay and the Delmarva Peninsula.
W91-01378 2J

SWAMPS
Decomposition of Roots in a Seasonally Flooded Swamp Ecosystem.
W91-01331 2H

Lakeshore Swamps of Bositeng Lake in the Xinjiang Autonomous Region (in Chinese).
W91-01569 2H

Methane Emissions from Fen, Bog and Swamp Peatlands in Quebec.
W91-01719 5B

SWEDEN
Occurrence of Limnic Micro-Crustaceans in Relation to pH and Humic Content in Swedish Water Bodies.
W91-01350 2H

SWIMMING
Disinfection and Screening of Sewage to Improve the Quality of Bathing Water at a U.K. Seaside Resort.
W91-01233 5D

Shore-Based Microbiological Sampling of Recreational/Bathing Waters: Possible Problems and Solutions.
W91-01234 5A

Virological Quality of Bathing Waters in England.
W91-01235 5B

Microbiological Quality of an Inland Surface Water Used for Recreational Purposes.
W91-01237 5B

SWIMMING POOLS
Plasma Chloroform Concentrations in Swimmers Using Indoor Swimming Pools.
W91-01053 5B

SWITZERLAND
Epilimnetic Carbon Flux and Turnover of Different Particle Size Classes in Oligo-Mesotrophic Lake Lucerne, Switzerland.
W91-01335 5B

SWORDFISH
Mercury Content of Swordfish, Xiphias gladius, in Relation to Length, Weight, Age, and Sex.
W91-01160 5B

SYNERGISTIC EFFECTS
Interaction Between Components of Electroplating Industry Wastes, Influence of the Receiving Water on the Toxicity of the Effluent.
W91-01106 5C

Thunderstorms, Cosmic Rays, and Solar-Lunar Influences.
W91-01490 2B

SYNOPTIC RAINFALL ANALYSIS PROGRAM
PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

TAG LAKE
Ecological Relationships of Wild Rice, Zizania aquatica. 9. Production in Organic-Flocculent Sediments.
W91-01373 2H

TAI HU (LAKE)
Analysis of Air Temperature Effect of Taihu Lake (in Chinese).
W91-01577 2H

TAILRACE
Hydraulic Jump in Triangular Channel.
W91-01669 8B

TAILWATER
Scourhole Developments in Shallow Tailwater.
W91-01674 8B

TAIWAN
Green Oysters Caused by Copper Pollution on the Taiwan Coast.
W91-01108 5C

Ecological Correlation Between Arsenic Level in Well Water and Age-adjusted Mortality from Malignant Neoplasms.
W91-01292 5C

Existing Forms of Phosphorus in Sediment from Middle and Northern Taiwan Strait (in Chinese).
W91-01575 2L

TALLAHASSEE
Sources and Distribution of Nitrate in Ground Water at a Farmed Field Irrigated with Sewage Treatment-Plant Effluent, Tallahassee, Florida.
W91-01857 5E

TAMAR ESTUARY
Longitudinal Dispersion Processes in the Upper Tamar Estuary.
W91-01127 2L

TASMANIA
Heat Contents, Thermal Stabilities and Birgean Wind Work in Dystrophic Tasmanian Lakes and Reservoirs.
W91-02043 2H

TAXONOMY
Effects of Herbivore Type and Density on Taxonomic Structure and Physiognomy of Algal Assemblages in Laboratory Streams.
W91-01806 2H

Recent Taxonomic Discoveries Concerning the Mussel Mytilus: Implications for Biomonitoring.
W91-02030 5A

TELESCOPIUM
Heavy Metal Concentration in Telescopium from Darwin Harbour, N.T., Australia.
W91-01164 5A

TEMPERATURE
Temporal Variability of Remotely Sensed Suspended Sediment and Sea Surface Temperature Patterns in Mobile Bay, Alabama.
W91-01131 2L

TEMPERATURE EFFECTS
Growth and Voltinism of Lotic Midge Larvae: Patterns Across an Appalachian Mountain Basin.
W91-01038 2H

Effects of Salinity, Temperature, and Cadmium on Cadmium-binding Protein in the Grass Shrimp, Palaemonetes pugio.
W91-01309 5B

Forests and the Temperature of Upland Streams in Wales: A Modelling Exploration of the Biological Effects.
W91-01343 2E

Temperature Selection by Striped Bass in a Gulf of Mexico Coastal River System.
W91-01385 8I

Potential Changes in Thermal Structure and Cycle of Lake Michigan Due to Global Warming.
W91-01389 2H

Thermal Structure of the Lower Great Lakes in a Warm Year: Implications for the Occurrence of Hypolimnion Anoxia.
W91-01390 2H

Effects of Climate Warming on Dissolved Oxygen Concentrations in Lake Erie.
W91-01391 2H

Potential Changes in the Thermal Habitat of Great Lakes Fish after Global Climate Warming.
W91-01394 2B

Potential Effects of Global Climate Warming on the Growth and Prey Consumption of Great Lakes Fish.
W91-01395 2B

Effect of Air Temperature on Growth of Largemouth Bass in North America.
W91-01396 2H

Size-Dependent Winter Mortality of Young-of-the-Year White Perch: Climate Warming and Invasion of the Laurentian Great Lakes.
W91-01399 8I

Climate Change and Fish Communities: A Conceptual Framework.
W91-01401 8I

Influence of Temperature Changes on Aquatic Ecosystems: An Interpretation of Empirical Data.
W91-01403 2B

Canopy Temperature as an Indicator of Differential Water Use and Yield Performance Among Wheat Cultivars.
W91-01407 3F

Effects of Light, Temperature, Nitrate, Orthophosphate, and Bacteria on Growth of and Hepatotoxin Production by Oscillatoria agardhii Strains.
W91-01762 5B

TEMPERATURE GRADIENT
Anomalous Temperature and Oxygen Gradients Under the Ice of a High-Plains Lake in Wyoming.
W91-01148 2H

TEMPORAL DISTRIBUTION
Temporal and Spatial Characteristics of Annual Precipitation over the Balkans in the Twentieth Century.
W91-01467 2B

Spatial and Temporal Patterns in the Hydrogeochemistry of a Poor Fen in Northern Wisconsin.
W91-01720 2H

Assessment of Aluminum Mobilization and Pathways in the Birkenes Catchment, Southern Norway.
W91-01893 5B

Spatial and Temporal Dispersion Patterns of Golden Perch, Macquaria ambigua, Larvae in an Artificial Floodplain Environment.
W91-01957 2H

TEMPORAL VARIATION
Causes of Temporal Variability of Lead in Domestic Plumbing Systems.
W91-01698 5B

TENISEY RIVER
Heterotrophic Microplankton in Plankton Successions and Self Purification Processes along the Yenisei River.
W91-01616 2H

TENNESSEE
Geology and Ground-Water Resources of the Memphis Sand in Western Tennessee.
W91-01851 2F

TEPHRA
Rain Scavenging of Tephra Aerosols from Mount St. Helens 1980 Eruptions.
W91-01468 2B

TERATOGENIC EFFECTS
Yolk Retinoids (Vitamin A) in Eggs of the Herring Gull and Correlations with Polychlorinated Dibenzo-p-dioxins and Dibenzofurans.
W91-01264 5C

TERTIARY WASTEWATER TREATMENT
Gravel Bed Hydroponic Systems Used for Secondary and Tertiary Treatment of Sewage Effluent.
W91-01276 5D

Glucose Induced Breakdown of Enhanced Biological Phosphate Removal.
W91-01639 5D

Growth and Value of Chlorella salina Grown on Highly Saline Sewage Effluent.
W91-01708 5D

TESTING PROCEDURES
Long-Term Toxicity Test Comprising Reproduction and Growth of Zebrafish with 4-Chloroaniline.
W91-01318 5C

Environmental Testing-Issues and Directions.
W91-01913 5G

TETRACHLOROBIPHENYL
Chronic Toxicity and Bioaccumulation of 2,5,2',5'- and 3, 4, 3',4'-Tetrachlorobiphenyl and Aroclor 1242 in the Amphipod Hyalella azteca.
W91-02035 5C

TEXAS
Modeling Studies for the City of Austin Stormwater Monitoring Programs.
W91-01194 4C

Elucidating Ground-Water Flow Paths in a Desert Terrane by Geochemical Methods.
W91-01784 2F

THE NETHERLANDS
Variability of Water Repellence in the Dunes Along the Dutch Coast.
W91-01081 2J

Deep-Well in the North-Holland Dune Area.
W91-01304 4B

Spirogyra Species and Accompanying Algae from Pools and Ditches in The Netherlands.
W91-01333 5C

Comparison of Historical and Recent Data on Hydrochemistry and Phytoplankton in the Rijnland Area (The Netherlands).
W91-01352 5B

Relations Between Acid Rain and Vesicular-Arbuscular Mycorrhiza.
W91-01410 5C

Trends in the Heavy Metal Levels in the Dissolved and Particulate Phase in the Dutch Rhine-Meuse (Maas) Delta.
W91-01817 5B

Mud Balance for Belgian-Dutch Coastal Waters Between 1969 and 1986.
W91-01934 2J

THERMAL EFFECTS
Potential Loss of Thermal Habitat for Brook Trout, Due to Climatic Warming, in Two Southern Ontario Streams.
W91-01397 8I

THERMAL POLLUTION
Modification of Coastal Currents by Power Plant Intake and Thermal Discharge Systems.
W91-01057 8B

THERMAL POWERPLANTS
Use of Solar Ponds in the Disposal of Desalting Concentrate.
W91-01982 5E

THERMAL STRATIFICATION
Thermal Structure of the Lower Great Lakes in a Warm Year: Implications for the Occurrence of Hypolimnion Anoxia.
W91-01390 2H

Thermal and Trophic Stability of Deeper Maine Lakes in Granite Watersheds Impacted by Acid Deposition.
W91-01530 5C

Heat Contents, Thermal Stabilities and Birgean Wind Work in Dystrophic Tasmanian Lakes and Reservoirs.
W91-02043 2H

THERMAL STRESS
Heat Stress, Plant-Available Soil Moisture, and Corn Yields in Iowa: A Short- and Long-Term View.
W91-01703 3F

Primer on Clothing Systems for Cold-Weather Field Work.
W91-01846 7B

THORIUM
Uranium and Thorium in Muscle Tissue of Fish Taken from the Southern Baltic.
W91-01922 5B

THREE-DIMENSIONAL MODEL
Three-Dimensional Computation of Flow and Bed Deformation.
W91-01493 2J

THUNDERSTORMS
Radar Observations of Precipitation Production in Thunderstorms.
W91-01430 2B

Thunderstorms above Frontal Surfaces in Environments without Positive CAPE. Part I: A Climatology.
W91-01481 2B

Thunderstorms above Frontal Surfaces in Environments without Positive CAPE. Part II: Organization and Instability Mechanisms.
W91-01482 2B

LIBRARY U. OF I. URBANA-CHAMP.

Thunderstorms, Cosmic Rays, and Solar-Lunar Influences.
W91-01490 2B

THYMIDINE
Incorporation of Thymidine, Adenine and Leucine into Natural Bacterial Assemblages.
W91-01931 2L

THYROID
Effects of Ingested Crude Oil on Thyroid Hormones and on the Mixed Function Oxidase System in Ducks.
W91-01775 5C

TIDAL CURRENTS
Hydrodynamic Model for Wind-Driven and Tidal Circulation in the Arabian Gulf.
W91-01077 2L

TIDAL EFFECTS
Episodic Changes in Lateral Transport and Phytoplankton Distribution in South San Francisco Bay.
W91-01045 2L

Tidal Dynamics of the Water Table in Beaches.
W91-01528 2F

River Discharge and Tidal Controls on Salt-Wedge Position and Implications for Channel Shoaling: Fraser River, British Columbia.
W91-01722 2L

TIDAL FLOODS
Effect of Tidal Flooding on Mortality of Juvenile Muskrats.
W91-01910 2L

TIDAL HYDRAULICS
Longitudinal Dispersion Processes in the Upper Tamar Estuary.
W91-01127 2L

Computed and Observed Currents, Elevations, and Salinity in a Branching Estuary.
W91-01129 2L

River Discharge and Tidal Controls on Salt-Wedge Position and Implications for Channel Shoaling: Fraser River, British Columbia.
W91-01722 2L

TIDAL MARSHES
Comparison of the Diets of Gulf Killifish, Fundulus grandis Baird and Girard, Entering and Leaving a Mississippi Brackish Marsh.
W91-01909 2L

Food Habits of Two Larval Flies (Dolichopodidae: Diptera) in Two Gulf Coast Oligohaline Tidal Marshes.
W91-01911 2L

TIDAL RIVERS
Effect of Submersed Aquatic Vegetation on Phytoplankton and Water Quality in the Tidal Freshwater Potomac River.
W91-01743 2H

TIDES
Tidal Straining, Density Currents, and Stirring in the Control of Estuarine Stratification.
W91-01128 2L

Seasonal and Tidal Abundance of Crab Larvae in a Tropical Mangrove System, Gulf of Nicoya, Costa Rica.
W91-01927 2L

TILAPIA
Effects of Water-Borne Cadmium on Plasma Cortisol and Glucose in the Cichlid Fish Oreochromis mossambicus.
W91-01777 5C

TILLAGE
Cropping System and Tillage Effects on Available Soil Water and Yield of Grain Sorghum and Winter Wheat.
W91-01705 3F

TIME SERIES ANALYSIS
Stochastic Models of Streamflow: Some Case Studies.
W91-01461 2E

TIN
Contamination of Potable Water by Corrosion of Tin-Lead Soldered Joints.
W91-01222 5B

TISSUE ANALYSIS
Paraffin Hydrocarbons in the Gonads of the Sea Urchin Strongylocentrotus nudus Normally and after Exposure to Diesel Oil (in Russian).
W91-01456 5B

Effects of Sample Preparation on Measured Concentrations of Eight Elements in Edible Tissues of Fish from Streams Contaminated by Lead Mining.
W91-01968 5A

TODOS OS SANTOS BAY
Use of the Mussel Watch and Molecular Marker Concepts in Studies of Hydrocarbons in a Tropical Bay (Todos os Santos, Bahia, Brazil).
W91-01690 5A

TOKYO
Trends of Air Quality and Atmospheric Deposition in Tokyo.
W91-01284 5B

TOLUENE
Behavior of Toluene Added to Sludge-Amended Soils.
W91-01024 5B

TOXIC WASTES
Examination and Chemical Treatment of Industrial Solid Wastes for Safe Land Application. I. Evaluation of Toxic Elements Present in Solid Wastes from a Fertilizer and Chemical Plant.
W91-01452 5E

Morphological Deformities in Chironomidae(Diptera) Larvae from the Lac St. Louis and Laprairie Basins of the St. Lawrence River.
W91-01790 5C

Relationship Between Chlorinated Hydrocarbons and Organic Carbon in Sediment and Porewater.
W91-01795 5B

TOXICITY
Aldicarb Food Poisonings in California, 1985-1988: Toxicity Estimates for Humans.
W91-01052 5C

Interaction Between Components of Electroplating Industry Wastes, Influence of the Receiving Water on the Toxicity of the Effluent.
W91-01106 5C

Bioaccumulation and Toxicity of Zinc in the Green Alga, Cladophora glomerata.
W91-01111 5C

Biotesting of Wastewater: A Comparative Study Using the Salmonella and CHO Assay Systems.
W91-01184 5E

Use of a Compartmental Model to Develop Rules for the Interpretation of Water Quality Data.
W91-01214 5B

Necessity of Bioassays in Water Quality Monitoring.
W91-01225 5A

Complexity, Entropy and Environmental Effect.
W91-01229 5C

Toxicity of Water Extracts of Hazardous Waste.
W91-01231 5C

Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

Copper Toxicity to Paratya australiensis: II. Influence of Bicarbonate and Ionic Strength.
W91-01259 5C

Copper Toxicity to Paratya australiensis: III. Influence of Dissolved Organic Matter.
W91-01260 5C

Comparison of Measured Instream Biological Responses with Responses Predicted Using the Ceriodaphnia dubia Chronic Toxicity Test.
W91-01261 5C

Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Acute Toxicities of Five Synthetic Pyrethroid Insecticides to Daphnia magna and Ceriodaphnia dubia.
W91-01263 5C

Toxicity of Fluoranthene in Sediment to Marine Amphipods: A Test of the Equilibrium Partitioning Approach to Sediment Quality Criteria.
W91-01265 5C

Assessment of the Ontario Ministry of the Environment Protocols for Conducting Daphnia magna Acute Lethal Toxicity Tests with Pulp and Paper Mill Effluents.
W91-01266 5C

Interaction of Carbon Tetrachloride with Beta-Naphthoflavone-Mediated Cytochrome P450 Induction in Winter Flounder (Pseudopleuronectes americanus).
W91-01279 5C

Induction of Peroxisome Proliferation in Rainbow Trout Exposed to Ciprofibrate.
W91-01280 5C

Relative Sensitivities of Different Life Stages of Isognomon californicum to Cadmium Toxicity.
W91-01308 5C

Effects of Tributyltin on Defense-Related Activities of Oyster Hemocytes.
W91-01311 5C

Macroinvertebrate Community Responses to Copper in Laboratory and Field Experimental Streams.
W91-01312 5C

Behavioral Indicators of Sublethal Toxicity in Rainbow Trout.
W91-01315 5C

Species-Specific Reaction of Liver Ultrastructure in Zebrafish (Brachydanio rerio) and Trout (Salmo gairdneri) after Prolonged Exposure to 4-Chloroaniline.
W91-01317 5C

Long-Term Toxicity Test Comprising Reproduction and Growth of Zebrafish with 4-Chloroaniline.
W91-01318 5C

Effect of pH on the Accumulation Kinetics of Pentachlorophenol in Goldfish.
W91-01321 5B

In Vivo Recovery of Glycogen Metabolism in Hemolymph and Tissues of a Freshwater Field

Crab Barytelphusa guerini on Exposure to Hexavalent Chromium.
W91-01324 5C

Effect of Copper Sulfate on Hematology, Blood Chemistry, and Hepato-Somatic Index of an Indian Catfish, Heteropneustes fossilis (Block), and Its Recovery.
W91-01325 5C

Effect of 3,4-Dichloroaniline and Metavanadate on Daphnia Populations.
W91-01326 5C

Incorporation of a Subacute Test with Zebra Fish into a Hierarchical System for Evaluating the Effect of Toxicants in the Aquatic Environment.
W91-01327 5C

Structure-Toxicity Relationships for Selected Weak Acid Respiratory Uncouplers.
W91-01364 5C

Species-Related Variations of Silver Bioaccumulation and Toxicity to Three Marine Bivalves (Variations Inter-Specifiques de la Bioaccumulation et de la Toxicite de L'Argent a L'Egard de Trois Mollusques Bivalves Marins).
W91-01420 5B

Autotrophic and Heterotrophic ATP Pools in Microbial Communities: Suggestions for Separation and for Bacterial Growth Rate Evaluation.
W91-01595 5A

Effects of Tributyltin on Survival, Growth, Morphometry, and RNA-DNA Ratio of Larval Striped Bass, Morone saxatilis.
W91-01687 5C

Comparative Toxicity of Solvent Yellow 33 (2-(2'-Quinolinyl)-1,3-Indandione) and Solvent Green 3 (1,4-Di-p-Toluidino-Anthraquinone) Dyes to Freshwater Organisms.
W91-01730 5C

Evaluation of the Potential for Toxics Exposure in the Great Lakes Region Using Storet Data.
W91-01732 5B

Interactions Between Bacillus thuringiensis subsp. israelensis and Fathead Minnows, Pimephales promelas Rafinesque, Under Laboratory Conditions.
W91-01759 5B

Effects of Light, Temperature, Nitrate, Orthophosphate, and Bacteria on Growth of and Hepatotoxin Production by Oscillatoria agardhii Strains.
W91-01762 5B

Effects of Various Biophysicochemical Conditions on Toxigenicity of Vibrio cholerae 01 During Survival with a Green Alga, Rhizoclonium fontanum, in an Artificial Aquatic Environment.
W91-01801 2H

Comparative Study on the Toxicity, Absorption and Depuration of Fenitrothion and Its Oxon in Japanese Tiger Shrimp.
W91-01960 5B

Effect of Short-Term Exposure to Pentachlorophenol and Osmotic Stress on the Free Amino Acid Pool of the Freshwater Amphipod Gammarus pseudolimnaeus Bousfield.
W91-01967 5C

Acute Toxicities and Hematological Effects of Two Substituted Naphthoquinones in Channel Catfish.
W91-01970 5C

Toxicity of Five Shale Oils to Fish and Aquatic Invertebrates.
W91-01971 5C

Effect of Heavy Metals on Bay Scallops, Surf Clams, and Blue Mussels in Acute and Long-term Exposures.
W91-01973 5C

Drilling Fluids and the Arctic Tundra of Alaska: Assessing Contamination of Wetlands Habitat and the Toxicity to Aquatic Invertebrates and Fish.
W91-01975 5B

Pentachlorophenol: Environmental Partitioning and Human Exposure.
W91-02016 5B

Acute Toxicity of Selected Herbicides and Surfactants to Larvae of the Midge Chironomus riparius.
W91-02017 5C

Rapid Dissipation of Glyphosate in Small Forest Ponds.
W91-02018 5B

Effects of Cadmium on Murex trunculus from the Adriatic Sea: I. Accumulation of Metal and Binding to a Metallothionein-like Protein.
W91-02020 5B

Effects of Cadmium on Murex trunculus from the Adriatic Sea: II. Oxygen Consumption and Acclimation Effects.
W91-02021 5C

Effect of Waterborne and Dietary Cadmium on Plasma Ions of the Teleost Oreochromis mossambicus in Relation to Water Calcium Levels.
W91-02022 5C

Uptake and Elimination of Waterborne Cadmium by the Fish Noemacheilus barbatulus L. (Stone Loach).
W91-02023 5C

Effects of Diet, Water Hardness, and Population Source on Acute and Chronic Copper Toxicity to Ceriodaphnia dubia.
W91-02024 5C

Shell as a Site of Lead Deposition in Helix aspersa.
W91-02025 5B

Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

Toxicity and Bioaccumulation of Selenate, Selenite and Seleno-L-Methionine in the Cyanobacterium Anabaena flos-aquae.
W91-02028 5C

Bioaccumulation of Selenium in Birds at Kesterson Reservoir, California.
W91-02029 5C

Expression of Results from Growth Inhibition Toxicity Tests with Algae.
W91-02031 5C

Effects of Paraquat on Mortality and Cardiorespiratory Function of Catfish Fry Plecostomus commersoni.
W91-02032 5C

Chronic Toxicity and Bioaccumulation of 2,5,2',5'- and 3, 4, 3',4'-Tetrachlorobiphenyl and Aroclor 1242 in the Amphipod Hyalella azteca.
W91-02035 5C

Comparative Toxicokinetics of 2,2'-Dichlorobiphenyls and 4,4'-Dichlorobiphenyls in the Pond Snail Lymnaea stagnalis.
W91-02036 5C

Toxicological Examination of Whitefish (Coregonus clupeaformis) and Northern Pike (Esox lucius) Exposed to Uranium Mine Tailings.
W91-02037 5C

Sublethal and Acute Toxicity of the Ethylene Glycol Butyl Ether Ester Formulation of Triclopyr to Juvenile Coho Salmon (Oncorhynchus kisutch).
W91-02039 5C

Comparative Toxicities of Selected Industrial Chemicals to Microorganisms and Other Aquatic Organisms.
W91-02041 5C

TOXICOLOGY

Toxicology of Chemical Mixtures: Experimental Approaches, Underlying Concepts, and Some Results.
W91-01075 5C

Complexity, Entropy and Environmental Effect.
W91-01229 5C

Hydrolysis of Chlorostilbene Oxide: II. Modeling of Hydrolysis in Aquifer Samples and in Sediment-Water Systems.
W91-01256 5B

Effect of Body Size on the Uptake and Bioconcentration of Di-2-Ethylhexyl Phthalate in Rainbow Trout.
W91-01257 5B

Copper Toxicity to Paratya australiensis: I. Influence of Nitrilotriacetic Acid and Glycine.
W91-01258 5C

Copper Toxicity to Paratya australiensis: II. Influence of Bicarbonate and Ionic Strength.
W91-01259 5C

Copper Toxicity to Paratya australiensis: III. Influence of Dissolved Organic Matter.
W91-01260 5C

Comparison of Measured Instream Biological Responses with Responses Predicted Using the Ceriodaphnia dubia Chronic Toxicity Test.
W91-01261 5C

Effect of Sediment Spatial Variance and Collection Method on Cladoceran Toxicity and Indigenous Microbial Activity Determinations.
W91-01262 5A

Acute Toxicities of Five Synthetic Pyrethroid Insecticides to Daphnia magna and Ceriodaphnia dubia.
W91-01263 5C

Yolk Retinoids (Vitamin A) in Eggs of the Herring Gull and Correlations with Polychlorinated Dibenzo-p-dioxins and Dibenzofurans.
W91-01264 5C

Toxicity of Fluoranthene in Sediment to Marine Amphipods: A Test of the Equilibrium Partitioning Approach to Sediment Quality Criteria.
W91-01265 5C

Assessment of the Ontario Ministry of the Environment Protocols for Conducting Daphnia magna Acute Lethal Toxicity Tests with Pulp and Paper Mill Effluents.
W91-01266 5C

Equilibrium Partitioning and Bioaccumulation of Sediment-Associated Contaminants by Infaunal Organisms.
W91-01267 5B

Relative Sensitivities of Different Life Stages of Isognomon californicum to Cadmium Toxicity.
W91-01308 5C

LIBRARY U. OF I. URBANA-CHAMP.

TOXICOLOGY

Effects of Salinity, Temperature, and Cadmium on Cadmium-binding Protein in the Grass Shrimp, Palaemonetes pugio.
W91-01309 5B

Influence of Cadmium and Zinc on Cadmium Turnover in the Zebrafish, Brachydanio rerio.
W91-01310 5C

Effects of Tributyltin on Defense-Related Activities of Oyster Hemocytes.
W91-01311 5C

Macroinvertebrate Community Responses to Copper in Laboratory and Field Experimental Streams.
W91-01312 5C

Acute Toxicity of Boron, Molybdenum, and Selenium to Fry of Chinook Salmon and Coho Salmon.
W91-01313 5C

Selenium Accumulation and Elimination in Mallards.
W91-01314 5B

Behavioral Indicators of Sublethal Toxicity in Rainbow Trout.
W91-01315 5C

Species-Specific Reaction of Liver Ultrastructure in Zebrafish (Brachydanio rerio) and Trout (Salmo gairdneri) after Prolonged Exposure to 4-Chloroaniline.
W91-01317 5C

Long-Term Toxicity Test Comprising Reproduction and Growth of Zebrafish with 4-Chloroaniline.
W91-01318 5C

Pharmacokinetic Modeling in Aquatic Animals. I. Models and Concepts.
W91-01361 5A

Molluscicidal and Piscicidal Properties of Copper(II) Tetraoxosulfate(VI) on Bulinus globosus (Morelet) and Clarias anguillaris (L).
W91-01363 5C

Structure-Toxicity Relationships for Selected Weak Acid Respiratory Uncouplers.
W91-01364 5C

Characterization of Genotoxic Components in Sediments by Mass Spectrometric Techniques Combined with Salmonella/Microsome Test.
W91-01686 5A

Detection of Organic Toxic Pollutants in Water and Waste-Water by Liquid Chromatography and In Vitro Cytotoxicity Tests.
W91-01712 5A

Simple Method for Estimating Dermal Absorption of Chemicals in Water.
W91-01731 5B

Effects of Ingested Crude Oil on Thyroid Hormones and on the Mixed Function Oxidase System in Ducks.
W91-01775 5C

Effects of Water-Borne Cadmium on Plasma Cortisol and Glucose in the Cichlid Fish Oreochromis mossambicus.
W91-01777 5C

Acute Toxicities and Hematological Effects of Two Substituted Naphthoquinones in Channel Catfish.
W91-01970 5C

Toxicity of Five Shale Oils to Fish and Aquatic Invertebrates.
W91-01971 5C

Mutagenic Activity of Surface Waters Adjacent to a Nuclear Fuel Processing Facility.
W91-01972 5C

Mutagens, Toxicants, and Other Constituents in Small City Sludges in New York State.
W91-01974 5A

Effects of Cadmium on Murex trunculus from the Adriatic Sea: I. Accumulation of Metal and Binding to a Metallothionein-like Protein.
W91-02020 5B

Effects of Cadmium on Murex trunculus from the Adriatic Sea: II. Oxygen Consumption and Acclimation Effects.
W91-02021 5C

Effect of Waterborne and Dietary Cadmium on Plasma Ions of the Teleost Oreochromis mossambicus in Relation to Water Calcium Levels.
W91-02022 5C

Effects of Diet, Water Hardness, and Population Source on Acute and Chronic Copper Toxicity to Ceriodaphnia dubia.
W91-02024 5C

Expression of Results from Growth Inhibition Toxicity Tests with Algae.
W91-02031 5C

Effects of Paraquat on Mortality and Cardiorespiratory Function of Catfish Fry Plecostomus commersoni.
W91-02032 5C

Chronic Toxicity and Bioaccumulation of 2,5,2',5'- and 3, 4, 3',4'-Tetrachlorobiphenyl and Aroclor 1242 in the Amphipod Hyalella azteca.
W91-02035 5C

Comparative Toxicokinetics of 2,2'-Dichlorobiphenyls and 4,4'-Dichlorobiphenyls in the Pond Snail Lymnaea stagnalis.
W91-02036 5C

Toxicological Examination of Whitefish (Coregonus clupeaformis) and Northern Pike (Esox lucius) Exposed to Uranium Mine Tailings.
W91-02037 5C

Effects of Short-term Pulses of Atrazine on Attached Algal Communities in a Small Stream.
W91-02040 5C

Comparative Toxicities of Selected Industrial Chemicals to Microorganisms and Other Aquatic Organisms.
W91-02041 5C

TOXINS

Environmental Factors Affecting the Production of Peptide Toxins in Floating Scums of the Cyanobacterium Microcystis aeruginosa in a Hypertrophic African Reservoir.
W91-01065 2H

Cyanobacterial Toxins in European Waters: Occurrence, Properties, Problems and Requirements.
W91-01221 5B

Isolation and Characterization of Hepatotoxic Microcystin Homologs from the Filamentous Freshwater Cyanobacterium Nostoc sp. Strain 152.
W91-01761 2H

Effects of Light, Temperature, Nitrate, Orthophosphate, and Bacteria on Growth of and Hepatotoxin Production by Oscillatoria agardhii Strains.
W91-01762 5B

Effects of Various Biophysicochemical Conditions on Toxigenicity of Vibrio cholerae 01 During Survival with a Green Alga, Rhizoclonium fontanum, in an Artificial Aquatic Environment.
W91-01801 2H

TRACE ELEMENTS

Variations in Suspended Sediment and Associated Trace Element Concentrations in Selected Riverine Cross Sections.
W91-01061 2J

Multi-Element Analysis of Natural Water Using Inductively Coupled Plasma-Source Mass Spectrometry (ICP-MS).
W91-01219 5A

Pitfalls of Sequential Extractions.
W91-01428 2K

Lithium in Drinking Water and the Incidences of Crimes, Suicides, and Arrests Related to Drug Addictions.
W91-01483 5F

Morphometric and X-ray Energy Dispersive Approach to Monitoring pH-Altered Cadmium Toxicity in Anabaena flos-aquae.
W91-02027 5C

TRACE LEVELS

Frequency Analysis of Trace Level Water Quality Data with a Time Varying Censoring Level.
W91-01198 5B

Trace Gas Analysis Using Thermoanalytical Methods.
W91-01955 5A

GC-FTIRS: Applications in Organic Trace Analysis.
W91-01956 5A

TRACE METALS

Metal Content of Fungal Sporocarps from Urban, Rural, and Sludge-Treated Sites.
W91-01005 5B

Batch Leaching Studies of Rundle Oil Shale.
W91-01010 5B

Chemical and Physical Speciation of Trace Metals in Fine Grained Overbank Flood Sediments in the Tyne Basin, North-East England.
W91-01082 5B

Accumulation of Scandium in the Shoots of Aquatic Bryophytes in Acid Water.
W91-01355 2H

TRACERS

Determination of the Origin of Suspended Matter and Sediments in the Elbe Estuary Using Natural Tracers.
W91-01132 2L

Device for In Situ Determination of Geochemical Transport Parameters. 1. Retardation.
W91-01293 5B

Tracer Study of the Hydraulics of Facultative Stabilization Ponds.
W91-01424 5D

Study of Pollutant Diffusion in the Jiujiang Segment of the Changjiang River (in Chinese).
W91-01571 5E

Field Evaluation of In-Situ Biodegradation of Chlorinated Ethenes: Part I, Methodology and Field Site Characterization.
W91-01789 5C

TRAINING

Annual Program Report - 1989 (FY 1988), (Massachusetts Water Resources Research Center).
W91-01860 9D

RAVELTIME
Travel Times of Seepage Water Through Multi-layered Covering Systems for Hazardous Waste Sites.
W91-01886 5B

REE RINGS
Use of Tree-Ring Chemistry to Document Historical Ground-Water Contamination Events.
W91-01295 5B

REES
Modified Hardwickia binata Bark for Adsorption of Mercury (II) from Water.
W91-01422 5D

RIADIMEFON
Rapid Method for the Simultaneous Analysis of Chlorpyrifos, Isofenphos, Carbaryl, Iprodione, and Triadimefon in Groundwater by Solid-Phase Extraction.
W91-01917 5A

RIALKYLAMINES
Fate of Cationic Surfactants in the Marine Environment: 1. Bioconcentration of Long-Chain Alkylnitriles and Trialkylamines.
W91-01723 5B

RIAZINE HERBICIDES
Triazine Herbicide Fate in a No-Tillage Corn (Zea mays L.)-Crownvetch (Coronilla varia L.) 'Living Mulch' System.
W91-01709 5B

RIAZINES
Photographic Screening Procedure for Triazine Herbicides in Water Using an Enhanced Luminescent Immunoassay.
W91-01230 5A

Triazine and Chloroacetamide Herbicides in Sydenham River Water and Municipal Drinking Water, Dresden, Ontario, Canada, 1981-1987.
W91-01306 5B

IBUTYLTIN
Effects of Tributyltin on Defense-Related Activities of Oyster Hemocytes.
W91-01311 5C

Tributyltin and Invertebrates of a Seagrass Ecosystem: Exposure and Response of Different Species.
W91-01625 5C

Effects of Tributyltin on Survival, Growth, Morphometry, and RNA-DNA Ratio of Larval Striped Bass, Morone saxatilis.
W91-01687 5C

Influence of pH on the Accumulation of Tri-N-butyltin Chloride and Triphenyltin Chloride in Carp.
W91-01774 5B

Determination of Trace Quantities of Organotin Compounds in Coastal Waters of Greece by Graphite Furnace Atomic Absorption Spectrometry.
W91-01823 5A

Effects of Tributyltin Within a Thalassia Seagrass Ecosystem.
W91-01906 5C

CHLOROETHANE
Rate of Degradation of 1,1,1-Trichloroethane in Water by Hydrolysis and Dehydrochlorination.
W91-01729 5B

CLOPYR
Sublethal and Acute Toxicity of the Ethylene Glycol Butyl Ether Ester Formulation of Triclopyr to Juvenile Coho Salmon (Oncorhynchus kutch).
W91-02039 5C

TRITIUM
Causes of Soil Salinization: 2. A Basin in East-Central Alberta, Canada.
W91-01783 2G

Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-01833 5B

TROPHIC LEVEL
Thermal and Trophic Stability of Deeper Maine Lakes in Granite Watersheds Impacted by Acid Deposition.
W91-01530 5C

Trophic Relation in the Microzooplankton Community.
W91-01615 2H

TROPICAL REGIONS
Macroinfaunal Community of a Tropical Estuarine Lagoon.
W91-01133 2L

Time Scales and Variability of Area-Averaged Tropical Oceanic Rainfall.
W91-01446 2B

Decadal-Scale Changes of the Circulation in the Tropical Atlantic Sector Associated with Sahel Drought.
W91-01465 2B

Use of the Mussel Watch and Molecular Marker Concepts in Studies of Hydrocarbons in a Tropical Bay (Todos os Santos, Bahia, Brazil).
W91-01690 5A

TROUT
Effect of Body Size on the Uptake and Bioconcentration of Di-2-Ethylhexyl Phthalate in Rainbow Trout.
W91-01257 5B

Induction of Peroxisome Proliferation in Rainbow Trout Exposed to Ciprofibrate.
W91-01280 5C

Behavioral Indicators of Sublethal Toxicity in Rainbow Trout.
W91-01315 5C

Species-Specific Reaction of Liver Ultrastructure in Zebrafish (Brachydanio rerio) and Trout (Salmo gairdneri) after Prolonged Exposure to 4-Chloroaniline.
W91-01317 5C

Survival of Early Life Stages of Brown Trout (Salmo trutta L.) in Relation to Aluminium Speciation in Upland Welsh Streams.
W91-01362 5C

Effects of Sublethal Exposure to Chlorine on the Uptake of Polychlorinated Biphenyl Congeners by Rainbow Trout, Salmo gairdneri (Richardson).
W91-01367 5C

Potential Loss of Thermal Habitat for Brook Trout, Due to Climatic Warming, in Two Southern Ontario Streams.
W91-01397 8I

Streamwater acidification in Relation to Acid Precipitations--Vegetation and Bedrock Influences, Consequences for Trout Populations: The Vosges Massif Case Study (Acidification des eaux de Surface sous L'Influence des Precipitations Acides : Role de la Vegetation et du Substratum, Consequences pour les Populations de Truites. Le Cas des Ruisseaux des Vosges).
W91-01738 5C

Redd Site Selection by Brown Trout in Douglas Creek, Wyoming.
W91-01745 8I

Effects of Low pH on the Chorion of Rainbow Trout, Oncorhynchus mykiss, and Brown Trout, Salmo trutta f. fario.
W91-01959 5C

TUNDRA
Drilling Fluids and the Arctic Tundra of Alaska: Assessing Contamination of Wetlands Habitat and the Toxicity to Aquatic Invertebrates and Fish.
W91-01975 5B

TURBIDITY
Algal Use of Sedimentary Phosphorus from an Amazon Floodplain Lake: Implications for Total Phosphorus Analysis in Turbid Waters.
W91-01047 2H

TURBINES
Mechanical Equipment of the Tashlyk Pumped-Storage Hydroelectric Station and Aleksandrovka Hydro Development of the Southern Ukraine Power Complex.
W91-01644 8C

TURBULENT FLOW
Flocculation in Turbulent Flow: Measurement and Modeling of Particle Size Distributions.
W91-01752 5F

TURGIDITY
Strength of Sclerophyllous Cells to Resist Collapse Due to Negative Turgor Pressure.
W91-01800 2I

TURKEY
Water Quality Management in Istanbul: Creating a Cleaner Environment.
W91-01254 5G

ULTRAFILTRATION
Removal of Organics from Offshore Produced Waters Using Nanofiltration Membrane Technology.
W91-01951 5D

ULTRAVIOLET RADIATION
Evaluation of Biologically Harmful Ultraviolet Radiation in Antarctica with a Biological Dosimeter Designed for Aquatic Environments.
W91-01138 7B

Ultraviolet Disinfection of Potable Water.
W91-01179 5F

UNDERGROUND STORAGE TANKS
Enforcement of Federal Underground Storage Tank Regulations.
W91-01103 5G

UNDERGROUND WASTE DISPOSAL
Effects and Behaviour of Pollutants During Artificial Groundwater Recharge.
W91-01251 5B

UNIT HYDROGRAPHS
Unit-Hydrograph Procedures for Arid Lands.
W91-01208 7C

UNITED KINGDOM
Environmental Impact Assessment: The Example of Marine Biology and the UK Power Industry.
W91-01158 6E

Appraisal of the Potential Health Impacts of Sewage Disposal to UK Coastal Waters.
W91-01278 5B

UNSATURATED FLOW
Groundwater: A Review of the 1989 Literature.
W91-01178 2F

Relation Between Saturated Conductivity and Capillary Retention Characteristics.
W91-01303 2F

LIBRARY U. OF I. URBANA-CHAMPAIGN

UNSATURATED FLOW

Experimental Testing of Transient Unsaturated Flow Theory at Low Water Content in a Centrifugal Field.
W91-01514 2G

Inverse Solution for One-Dimensional Infiltration, and the Ratio A/K1.
W91-01519 2G

Approximate Solutions for Cation Transport During Unsteady, Unsaturated Soil Water Flow.
W91-01535 2G

Stochastic Analysis of Unsaturated Flow: One-Dimensional Monte Carlo Simulations and Comparisons With Spectral Perturbation Analysis and Field Observations.
W91-01536 2G

UNSATURATED ZONE

Infiltration of Immiscible Contaminants in the Unsaturated Zone.
W91-01296 5B

UNSTEADY FLOW

Improvements to Surcharge Calculations in EXTRAN.
W91-01192 7C

Approximate Solutions for Cation Transport During Unsteady, Unsaturated Soil Water Flow.
W91-01535 2G

UPGRADING

Upgrading Antique Sewers.
W91-01484 5B

URANIUM

Uranium and Thorium in Muscle Tissue of Fish Taken from the Southern Baltic.
W91-01922 5B

Toxicological Examination of Whitefish (Coregonus clupeaformis) and Northern Pike (Esox lucius) Exposed to Uranium Mine Tailings.
W91-02037 5C

URBAN AREAS

Applications of Magnetic Measurements to Sediment Tracing in Urban Highway Environments.
W91-01997 5A

URBAN DRAINAGE

Transport of Heavy Metals Within a Small Urban Catchment.
W91-01992 5B

URBAN HYDROLOGY

Proceedings of Stormwater and Water Quality Model Users Group Meeting.
W91-01188 5G

User Defined Conduits in the EXTRAN Block of SWMM.
W91-01189 4C

Revised Runoff Block of SWMM.
W91-01190 4C

SWMM-4.
W91-01191 4C

Improvements to Surcharge Calculations in EXTRAN.
W91-01192 7C

Urban Runoff Modeling for Administrative Purposes.
W91-01193 4C

Modeling Studies for the City of Austin Stormwater Monitoring Programs.
W91-01194 4C

Application of SWMM in the New Orleans Area.
W91-01195 4C

Use of SWMM/EXTRAN and TR-20 to Develop Regional Stormwater Detention Plans in the Washington, D.C. Region.
W91-01196 4C

Application of QUAL II to Explore Wasteload Allocation Alternatives.
W91-01197 5G

Frequency Analysis of Trace Level Water Quality Data with a Time Varying Censoring Level.
W91-01198 5B

Multi-Model Micro-Computer Based Wet Detention Basin Design Methodology.
W91-01200 4C

Modeling and Field Evaluations of Urban Wet Detention Ponds.
W91-01201 4C

Hydrologic Data Automation Using AutoCAD.
W91-01202 7C

Distributed Rainfall-Runoff Modeling Based on Digital Map Database.
W91-01203 7C

PC-SYNOP, A Rainfall Analysis Tool.
W91-01204 7C

Computer Aided Planning of Drainageway Improvements Made Easy with LOTUS 1-2-3.
W91-01205 7C

Hyetograph Compositing Effects on Urban Runoff Modelling.
W91-01206 7C

Flood Hydrograph for Ungaged Watershed.
W91-01207 7C

Gulf Coast Flood Routing.
W91-01210 2E

Pollution Aspects of Storm-Sewage Overflows.
W91-01268 5B

Peak-Flow Characteristics of Small Urban Drainage Along the Wasatch Front, Utah.
W91-01834 4C

URBAN PLANNING

Infrastructure--Weathering a Boom-and-Bust Development Cycle.
W91-01555 6B

URBAN RUNOFF

Proceedings of Stormwater and Water Quality Model Users Group Meeting.
W91-01188 5G

User Defined Conduits in the EXTRAN Block of SWMM.
W91-01189 4C

Revised Runoff Block of SWMM.
